Energy Research Abstracts

Abstracts 20525-22977

Office of Scientific and Technical Information
UNITED STATES DEPARTMENT OF ENERGY

The Office of Scientific and Technical Information

The Office of Scientific and Technical Information (OSTI) in Oak Ridge, Tennessee, provides direction for the Department of Energy's scientific and technical information (STI) program and maintains a centralized base of support to assist Departmental elements in planning, developing, and implementing STI activities. DOE-originated and worldwide literature and software on advances in subjects of interest to DOE researchers are collected, processed, and disseminated using computerized databases, publications, and other media.

This information collection, containing over three million citations, represents a major national resource of scientific and technical information. In addition to information from DOE and its contractors, DOE acquires information through its international partnerships with the International Energy Agency's Energy Technology Data Exchange (ETDE), a consortium comprised of members from North America and Europe, Japan and Korea; the International Atomic Energy Agency's International Nuclear Information System, representing 80 countries; bilateral agreements with foreign governments; exchange agreements with other U.S. government agencies; and contracts with private information organizations and professional societies.

The subject scope of this information extends beyond energy, covering basic scientific studies in such areas as radiology, atomic and nuclear physics, radiation and nuclear chemistry, superconductivity, supercomputers, the environment, health and safety, waste management, nuclear medicine, and arms control.

Major DOE databases are available within the United States through DIALOG Information Services and STN International and outside the United States through formal governmental exchange agreements. DOE and DOE contractor offices can access the databases online through the Integrated Technical Information System (ITIS) maintained by OSTI.

Energy Research Abstracts

Coverage

Energy Research Abstracts (ERA) provides abstracting and indexing coverage of all scientific and technical reports and patent applications originated by the U.S. Department of Energy, its laboratories, energy centers, and contractors, as well as theses and conference papers and proceedings issued by these organizations in report form. Audiovisual materials, computer media (magnetic tapes, diskettes, etc.), and engineering drawings are included in this definition. *ERA* also covers other energy information prepared *in report form* by federal and state government organizations, foreign governments, and domestic and foreign universities and research organizations, *provided* that the full text of the document has been received by OSTI. Foreign report information is obtained through the International Energy Agency's 18-nation Energy Technology Data Exchange, the International Atomic Energy Agency's International Nuclear Information System, or nation-to-nation agreements. The purpose of this publication is to announce documents produced or obtained by DOE that are not so readily available as journal articles, books, or patents.

Scope

The scope of *ERA* encompasses DOE's research, development, demonstration, and technology programs resulting from its broad charter for energy sources, supplies, safety, environmental impacts, and regulation.

The citations presented in *ERA* are available for online searching as records within the Energy Science and Technology Database (EDB). The current-year records are available on the Integrated Technical Information System (ITIS).

Availability

DOE and DOE contractors can obtain *ERA* (regular issues and annual indexes) by using VISA, MasterCard, or OSTI deposit accounts. Contact the Office of Scientific and Technical Information, P.O. Box 62, Oak Ridge, TN 37831, Attention: Information Services. For further information, call (615)576-8401. *ERA* is also available at authorized GPO Depository Libraries. (List is provided on the inside back cover.)

ERA (regular issues and annual indexes) is available to the public on a subscription basis from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Managing Editor, Leota S. Kane
Technical Editor, Barry C. Steele

Information Sources

The citations presented in *Energy Research Abstracts* are a subset of the worldwide energy information provided to the Office of Scientific and Technical Information (OSTI) through exchange agreements with foreign sources and through exchanges or contracts with U.S. organizations.

The **Energy Technology Data Exchange (ETDE)** was established by the International Energy Agency to promote cooperation among members in conducting appropriate energy-related research and development programs through the development of a formal central information sharing system. In accomplishing the objectives of the ETDE, members select, abstract, and index relevant research information published in their countries in accordance with Exchange standards. OSTI serves as the central receiving and processing center for this information, which it then disseminates to national centers in the participating countries. The following countries are currently members of the ETDE:

- Australia
- Brazil
- Canada
- Denmark
- Finland
- France
- Germany
- Italy
- Japan
- Norway
- Poland
- Republic of Korea
- Spain
- Sweden
- Switzerland
- The Netherlands
- United Kingdom
- United States

The **International Nuclear Information System (INIS)** was established to promote the exchange of information on nuclear science and technology. Its operation is similar to that of the ETDE, with the INIS Secretariat being located in Vienna, Austria. Currently, 79 countries and 15 international organizations are members of INIS. OSTI serves as the INIS national center for the United States.

In the exercise of its rights and responsibilities under the agreements to which it is a party, the **Office of Scientific and Technical Information** both receives information from the above sources and submits U.S.-produced information to them. In addition to materials generated by the Department of Energy, this U.S.-produced information is gathered from other government agencies as well as under contract with private information processing companies. All input is computer processed and entered into a database for online retrieval. The database serves as well for the production of numerous OSTI publications.

How To Read A Citation

The principal data elements included in these citations are:

1. **Abstract number** within volume.
2. **Report number** identification for report-type literature.
3. **Title and subtitle** (non-English title may appear in parentheses, if applicable).
4. **Author(s).** First 10 names in the data record are printed, then "et al." is listed.
5. **Author affiliation.** Only first one is listed, in parentheses after author(s) to which it applies.
6. **Collaboration,** if present.
7. **Corporate author(s)** identifying corporation responsible for document.
8. **Date of publication.** If not known, a processing date is in brackets.
9. **Number of pages** or page range. Prices are based on total pages unless special pricing applies.
10. **Language** of document if non-English.
11. **Monograph title** if citation is an analytic (part, chapter, or paper) of a larger monograph.
12. **Sponsoring organization.**
13. **Contract or grant number.**
14. **Secondary identifying number;** may be a conference number.
15. **Conference title, location, and date,** if applicable.
16. **Order number.** The "DE" order number may be used for ordering from NTIS or OSTI, as appropriate. The "TI" prefix is valid only at OSTI.
17. **Sources of availability** from which a copy of the document may be obtained; usually appear as abbreviations. (See information on following page.)
18. **Drop note** or explanatory statement.
19. **Abstract.**
20. **Subject descriptors.** Listed only if no abstract or only a brief statement is included.

54 (DOE/ER/60888-1-Vol.1, pp. 115-117) **Investigation of air pollution in house due to use of various fuels.** Luo, Dayu (Chengdu Sanitation (China)). Canada Mortgage and Housing Corp., Ottawa, ON (Canada). 1990. (CONF-900724-Vol.1: Indoor Air '90: 5th international conference on indoor air quality and climate, Toronto (Canada), 29 Jul - 3 aug 1990). In Indoor air '90: The fifth international conference on indoor air quality and climate. Volume 1: Final report. 786p. Order Number DE90017786. Source: NTIS.

Air pollution in houses caused by combustion of coal is more serious than that by combustion of natural gas and methane (primarily by SO_2 and NO_2). The gas concentration after cooking is higher than that before cooking, and it is higher in kitchen than in bedroom and outdoor. There were mutations in the extract from TSP in $30m^2$ air in the bedroom, kitchen and outdoor, where coal and natural gas were used. The supernatant saliva activity of children whose family uses coal is significantly lower than that of pumping streams.

How To Order from the Availability Sources

TO OBTAIN A REPORT

Report literature, usually identified by an alphanumeric identifier at the beginning of a citation, is available from the sources listed in the citation (see example of element 2 on page iii). Often the sources are listed as abbreviations. Corresponding addresses are provided at right from which documents with these abbreviations may be ordered. When "OSTI" is given, **DOE and DOE contractors may order these documents from OSTI.** (However, check with your library or information organization which may require that orders go through them to OSTI.) OSTI prices are based on total pages unless special pricing applies. The public should order from NTIS or from one of the other agencies listed in the citation. NTIS price codes may continue to appear in some records. To expedite processing, an order form is provided in the back of this publication. NOTE: The order numbers provide quicker access for report ordering. Use the order number where possible.

How To Use the Indexes

Five indexes are provided for approaching the content of each issue of *Energy Research Abstracts.* Descriptions of entries in these indexes follow.

Corporate Author Index
The corporation, organization, or institution responsible for the issuance of the document is listed in this index. The entries are arranged alphabetically and provide the title and citation number of the reference. For example, the listing for the "Report" sample citation would appear as shown at right.

Wisconsin Univ., Madison (USA). Dept. of Physics
[Development of a hydrogen and deuterium polarized gas target for application in storage rings]: Progress report, 15:18494 (R;US)
Wisconsin Univ., Madison (USA). Lab. of Genetics
Organization of the R chromosome region in maize: Final progress report, June 1, 1983–May 31, 1986, 15:18255 (R;US)

Personal Author Index
Each author's name listed on a document cited in this issue is indexed. An index entry provides title and citation number; for secondary and other names, a cross-reference is given to the primary author name where the full index entry is located.

Hadley, D.L., *See* Lee, A.D., 15:17651
Haeberli, W., [Development of a hydrogen and deuterium polarized gas target for application in storage rings]: Progress report, 15:18494 (R;US)

Subject Index
This index lists the main subject descriptors assigned to each record by indexing professionals. A secondary or qualifier term is used where necessary to describe materials, objects, and processes. Document titles may be enhanced with additional informative phrases where necessary. An excerpt from this index appears at right.

HYDROGEN ISOTOPES
See also DEUTERIUM
HYDROGEN 4
TRITIUM
Neutron-Rich Isotopes
Study on the strong neutron-rich nuclei of lightest elements, 15:18686 (RA;SU;In Russian)

Contract Number Index
DOE technical reports are listed by contract number. Each entry also provides the primary corporation or organization cited for that contract number. A typical entry is shown.

FG02-88ER40438 **Wisconsin Univ., Madison (USA). Dept. of Physics**
15:18494 DOE/ER/40438–T1
FG02-88ER60664 **Rogers and Associates Engineering Corp., Salt Lake City, UT (USA)**

Report Number Index
Technical report literature is indexed by the alphanumerical identifier of the report. Patent documents and conferences are included for convenience. Each entry lists the citation number, the source of availability of the document, an indicator of presence at a GPO depository library, order number, and distribution category. A typical entry is:

DOE/ER/40438–
T1 15:18494 NTIS, OSTI E 1.99: DE89007246 MF-411

Subject Contents

The subject content of *Energy Research Abstracts* is arranged as shown below. The two-digit and four-digit category numbers printed here illustrate the category number assignment used in the database records.* The following list includes all of the 38 first-level and the 313 second-level categories. Because each issue of *ERA* publishes citations only for those documents announced during the past semimonthly period, some subject categories may not be present in every issue.

Numerical Listing of Categories

01 COAL LIGNITE, AND PEAT

20525 (CONF-941144–152) **Electrostatic beneficiation of coal.** Lindquist, D.A.; Mazumder, M.K.; Tennal, K.B.; McKendree, M.H.; Kleve, M.G.; Scruggs, S. Arkansas Univ., Little Rock, AR (United States). [1994]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93PC93203. From 1994 fall meeting of the Materials Research Society (MRS); Boston, MA (United States); 28 Nov - 2 dec 1994. Order Number DE95010508. Source: OSTI; NTIS; GPO Dep.

Electrostatic beneficiation is being investigated as a dry precombustion cleaning method for removing pyritic forms of sulfur from coal. The coal is ground to a fine powder and then electrostatically charged. The pyrite particles adopt a negative charge and the carbon particles a positive charge. The pyrite and carbon fractions can then be separated in an electrostatic separator based on their charge differences. The efficiency of the beneficiation process is determined by quantitative sulfur analysis of the feed and processed coal. A description of the electrostatic beneficiation process and characterization of the physical and chemical properties of Illinois No. 6 bituminous coal processed by electrostatic beneficiation are presented.

20526 (DOE/PC/88881–T26-Vol.2) **Engineering development of advanced froth flotation. Volume 2, Final report.** Ferris, D.D. (ICF Kaiser Engineers, Inc., Pittsburgh, PA (United States)); Bencho, J.R.; Torak, E.R. ICF Kaiser Engineers, Inc., Pittsburgh, PA (United States); Ohio Coal Development Office, Columbus, OH (United States); Babcock and Wilcox Co., New Orleans, LA (United States); Consolidation Coal Co., Pittsburgh, PA (United States); Center for Research on Sulfur in Coal, Carterville, IL (United States); EIMCO Processed Equipment Co., Salt Lake City, UT (United States); Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). Geological Survey; Kentucky Energy Cabinet Lab., Lexington,Mar 1995. 499p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-88PC88881. Order Number DE95011486. Source: OSTI; NTIS; GPO Dep.

This report is an account of findings related to the Engineering and Development of Advanced Froth Flotation project. The results from benchscale and proof-of-concept (POC) level testing are presented and the important results from this testing are used to refine a conceptual design and cost estimate for a 20 TPH Semi-Works Facility incorporating the final proposed technology.

20527 (DOE/PC/88881–T27) **Engineering development of advanced physical fine coal cleaning technologies: Froth flotation. Quarterly technical progress report No. 25, October 1, 1994–December 31, 1994.** ICF Kaiser Engineers, Inc., Pittsburgh, PA (United States); Ohio Coal Development Office, Columbus, OH (United States); Babcock and Wilcox Co., New Orleans, LA (United States); Consolidation Coal Co., Pittsburgh, PA (United States); Center for Research on Sulfur in Coal, Carterville, IL (United States); EIMCO Processed Equipment Co., Salt Lake City, UT (United States); Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). Source: OSTI; NTIS; GPO Dep.

A study conducted by Pittsburgh Energy Technology Center of sulfur emissions from about 1300 United States coal-fired utility boilers indicated that half of the emissions were the result of burning coals having greater than 1.2 pounds of SO_2 per million BTU. This was mainly attributed to the high pyritic sulfur content of the boiler fuel. A significant reduction in SO_2 emissions could be accomplished by removing the pyrite from the coals by advanced physical fine coal cleaning. An engineering development project was prepared to build upon the basic research effort conducted under a solicitation for research into Fine Coal Surface Control. The engineering development project is intended to use general plant design knowledge and conceptualize a plant to utilize advanced froth flotation technology to process coal and produce a product having maximum practical pyritic sulfur reduction consistent with maximum practical BTU recovery. This progress report provides a summary of the technical work undertaken during this period, highlighting the major results. A brief description of the work done prior to this quarter is provided in this report under the task headings.

20528 (DOE/PC/89908–T32) **Engineering design and analysis of advanced physical fine coal cleaning technologies. Final report.** Aspen Technology, Inc., Cambridge, MA (United States). Aug 1994. 149p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-89PC89908. Order Number DE95010650. Source: OSTI; NTIS; GPO Dep.

This report describes the gravity separation equipment models available in the Coal Cleaning Simulator developed by Aspen Technology, Inc. This flowsheet simulator was developed in collaboration with ICF Kaiser Engineers, /a subcontractor to Aspen Technology, Inc., and CQ Inc., a subcontractor to ICF Kaiser Engineers. The algorithms and FORTRAN programs for modeling gravity separation, which include calculations for predicting process performance, and calculations for equipment sizing and costing, were developed by ICF Kaiser Engineers. Aspen Technology integrated these and other models into the ASPEN PLUS system to provide a simulator specifically tailored for modeling coal cleaning plants. ICF Kaiser Engineers also provided basic documentation for these models; Aspen Technology, Inc. has incorporated the information into this topical report. The report documents both the use and the design bases for the models, and provides to the user a good understanding of their range of applicability and limitations.

20529 (DOE/PC/92162–T5) **The development of coal-based technologies for Department of Defense facilities. Semiannual technical progress report, March 28, 1994–September 27, 1994.** Miller, B.G. (and others); Bartley, D.A.; Morrison, J.L. Consortium for Coal-Water Slurry Fuel Technology, University Park, PA (United States). 14 Apr 1995. 270p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract FC22-92PC92162. Order Number DE95012424. Source: OSTI; NTIS; GPO Dep.

The US Department of Defense (DOD), through an Interagency Agreement with the US Department of Energy (DOE), has initiated a three-phase program with the Consortium for Coal Water Slurry Fuel Technology, with the aim of decreasing DOD's reliance on imported oil by increasing its use of coal. The program is being conducted as a cooperative agreement between the Consortium and DOE and the first two phases of the program are underway. Activities this reporting period included performing coal beneficiation/preparation studies, conducting combustion performance evaluations, preparing retrofit engineering designs, determining retrofit economics, and installing a micronized coal-water mixture (MCWM) circuit.

20530 (DOE/PC/94155–T1) **POC-scale testing of an advanced equipment/technology. Quarterly technical progress report No. 1, October–December 1994.** Groppo, J.G.; Parekh, B.K. Kentucky Univ., Lexington, KY (United States). Center for Applied Energy Research. 30 Jan 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-94PC94155. Order Number DE95010656. Source: OSTI; NTIS; GPO Dep.

The main objective of the proposed program is to evaluate a novel surface modification technique, which utilizes the synergistic effect of metal ions-surfactant combination, for dewatering of ultrafine clean coal on a proof-of-concept scale of 1 to 2 tph. The novel

surface modification technique developed at the University of Kentucky Center for Applied Energy Research (UKCAER) will be evaluated using vacuum, centrifuge, and hyperbaric filtration systems. Dewatering tests will be conducted using the fine clean coal froth produced by the column flotation units at the Powell Mountain Coal Company, Mayflower Preparation Plant in St. Charles, Virginia. The POC-scale studies will be conducted on two different types of clean coal, namely, high sulfur and low sulfur clean coal. The Mayflower Plant processes coals from five different seams, thus the dewatering studies results could be generalized for most of the bituminous coals. The project team met with the DOE project management representatives at the Pittsburgh Energy Technology Center on November 18, 1994 to review project plans. After review and comments provided by the DOE, the Project Management and Work Plans were issued on December 15, 1994. The project team held a meeting at the Powell Mountain Coal Company Mayflower Preparation Plant to discuss the strategy on installation and operation of the various dewatering units. Samples of the low sulfur and high sulfur clean coal froths were collected and shipped to UKCAER and Andritz Ruthner Inc.

20531 (WRI–95-R023) **The use of NMR techniques for the analysis of water in coal and the effect of different coal drying techniques on the structure and reactivity of coal. Final report.** Netzel, D.A.; Miknis, F.P.; Wallace, J.C. Jr.; Butcher, C.H.; Mitzel, J.M.; Turner, T.F.; Hurtubise, R.J. Western Research Inst., Laramie, WY (United States). Feb 1995. 123p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91310. Order Number DE95015508. Source: OSTI; NTIS; GPO Dep.

Western Research Institute has conducted a study of different methods of coal drying as pretreatment steps before liquefaction. The objectives of this study were to develop a combined chemical dehydration/nuclear magnetic resonance (NMR) method for measuring the moisture content of coal, to measure the changes in coal structure that occur during drying, and to determine the effects of different drying methods on liquefaction reactivity of coals. Different methods of drying were investigated to determine whether coal drying can be accomplished without reducing the reactivity of coals toward liquefaction. Drying methods included thermal, microwave, and chemical dehydration. Coals of rank lignite to high volatile bituminous were studied. Coals that were dried or partially dried thermally and with microwaves had lower liquefaction conversions than coals containing equilibrium moisture contents. However, chemically dried coals had conversions equal to or greater than the premoisturized coals. The conversion behavior is consistent with changes in the physical structure and cross linking reactions because of drying. Thermal and microwave drying appear to cause a collapse in the pore structure, thus preventing donor solvents such as tetralin from contacting reactive sites inside the coals. Chemical dehydration does not appear to collapse the pore structure. These results are supported by the solvent swelling measurements in which the swelling ratios of thermally dried and microwave-dried coals were lower than those of premoisturized coals, indicating a greater degree of cross linking in the dried coals. The swelling ratios of the chemically dried coals were greater than those of the premoisturized coals because the pore structure remaining unchanged or increased when water was removed. These results are consistent with the NMR results, which did not show significant changes in coal chemical structure.

20532 (CHEC-R–9306) **Pyrolysis and combustion of coke from Chalmers fluid bed.** Hansen, J.; Bank, L. Danmarks Tekniske Hoejskole, Lyngby (Denmark). Inst. for Kemiteknik. Feb 1993. 24p. (In Danish). Order Number DE95787754. Source: OSTI; NTIS.

The aim was to investigate whether nitrous oxide was produced from coke and coal under various conditions of nitrogen monoxide, oxygen and carbon monoxide content in the gas phase. Most of the experiments were carried out at a temperature of 800 degrees centigrade, and some at temperatures of 750 and 950 degrees centigrade. The particulates were taken from a 12 MW(t) fluid bed boiler at Chalmers Tekniska Hoegskola (Sweden). A nitrous oxide analyzer produced by Perkin-Elmer was examined for efficiency. The experiments are described in detail. Under no conditions was there a deflection of more than 10 ppm N_2O particulates taken from the fluid bed, via gas chromatography an as yet unidentified component was found. Acetylene, used for welding, was found to contain an impurity to which the analyzer is sensitive. From the coke, particulates 'LEA KOKS' 220 ppm N_20 (F23) was measured at 800 degrees centigrade. In relation to F13 and F30, the gas analyzer measured 110 and 90 ppm. Via gas chromatography only large amounts of CH_4 were found. (AB)

20533 (DOE/MC/25006–3997) **Fluidized-bed testing of Z-SORB III sorbent.** Gupta, R. P.; Gangwal, S. K.; Khare, G. P. Research Triangle Inst., Research Triangle Park, NC (United States). Aug 1994. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-88MC25006. Order Number DE95000072. Source: OSTI; NTIS; GPO Dep.

Phillips Petroleum Company (PPCo) successfully developed a fluidizable version of their proprietary Z-SORB sorbent. Z-SORB sorbent is a ZnO-based regenerable sorbent for removing hydrogen sulfide (H_2S) and carbonyl sulfide (COS). RTI conducted a life-cycle test on this sorbent in the high-temperature, high-pressure (HTHP) semi-batch fluidized-bed reactor. This test consisted of 50 cycles of sulfidation and regeneration to demonstrate the long-term chemical reactivity and mechanical strength of the Z-SORB sorbent. A simulated air-blown gasifier coal gas was used at 20 atm and 538 °C (1,000°F). The Z-SORB sorbent exhibited excellent sulfur removal capability; the prebreakthrough H_2S levels were below the detection limit of the analyzer (<10 ppmv). The sulfur capacity of the sorbent at breakthrough (500 ppM H_2S in reactor exit gas) was 20.2 g S/100 g sorbent in Cycle 1 and was 10 g S/100 g sorbent in Cycle 50. The sorbent loss from the reactor due to fines generation was small. While no significant change in particle size was observed, the bulk density increased by 8 percent over 51 cycles. The attrition resistance of the sorbent after the 51 cycles was slightly lower than the fresh material. The thermogravimetric analyzer (TGA) tests on fresh and reacted sorbents confirmed the sulfur capacity decline in the bench tests; however, the TGA data indicated no change in the H_2S absorption rate between the fresh and reacted sorbents. The regeneration of the sulfided sorbent was successfully carried out using 2 to 2.5 percent 0_2 in N_2 at a temperature of 649 to 704°C (1,200 to 1,300°F) with no evidence of sulfate formation. Overall, the sorbent exhibited good performance.

20534 (DOE/MC/26042–4047) **PFBC HGCU Test facility. Technical progress report, Fourth quarter, CY 1994.** American Electric Power Service Corp., Columbus, OH (United States). Jan 1995. 311p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-89MC26042. Order Number DE95011302. Source: OSTI; NTIS; GPO Dep.

During this quarter, the Tidd Hot Gas Clean Up System completed a 691-hour test run which began during the third quarter. Table 1 summarizes all test runs since initial operation. Following this test run the system was shut down and the filter opened for inspection and recandling. The system remained out of service during the remainder of the quarter. In addition to monitoring and evaluating the performance of the HGCU system during testing, engineering effort was devoted to posttest inspection of the APF (Advanced Particle Filter) and evaluation of the effects of totally spoiling the primary cyclone. In addition, the authors worked with Westinghouse in the selection of replacement candles that were installed during the fourth quarter. During the unit outage this quarter, the primary cyclone upstream of the APF was modified to force all of the ash to pass through the cyclone and enter the APF without using spoiling air. Appendices to this report describe the dust shroud support strap design; an analysis of the effect of support-transferred vibrations on the failure of ceramic candle filters; the Tidd APF operation; the Tidd APF boroscope inspection; a general inspection of Tidd filter internals; tally of Tidd filters; ash formations in the W-APF-October 1994 post-test inspection; characterization of the as-manufactured and PFBC-exposed 3M CVI-SiC composite filter matrix; strength characterization of the first and second generation candle filters after 1,705 hours of PFBC operation at Tidd; and filters used in the December 1994 recandling effort at Tidd.

20535 (DOE/MC/28202–4041) **Conceptual design report – Gasification Product Improvement Facility (GPIF).** Sadowski, R.S. (CRS Sirrine Engineers, Inc., Greenville, SC (United States)); Skinner, W.H.; House, L.S.; Duck, R.R.; Lisauskas, R.A.; Dixit, V.J.; Morgan, M.E.; Johnson, S.A.; Boni, A.A. PowerServe Div.; PSI-Environmental Instruments Corp., Andover, MA (United States). Sep 1994. 156p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC28202. Order Number DE95011303. Source: OSTI; NTIS; GPO Dep.

The problems heretofore with coal gasification and IGCC concepts have been their high cost and historical poor performance of fixed-bed gasifiers, particularly on caking coals. The Gasification Product Improvement Facility (GPIF) project is being developed to solve these problems through the development of a novel coal gasification invention which incorporates pyrolysis (carbonization) with gasification (fixed-bed). It employs a pyrolyzer (carbonizer) to avoid sticky coal agglomeration caused in the conventional process of gradually heating coal through the 400 F to 900 F range. In so doing, the coal is rapidly heated sufficiently such that the coal tar exists in gaseous form rather than as a liquid. Gaseous tars are then thermally cracked prior to the completion of the gasification process. During the subsequent endothermic gasification reactions, volatilized alkali can become chemically bound to aluminosilicates in (or added to) the ash. To reduce NH_3 and HCN from fuel born nitrogen, steam injection is minimized, and residual nitrogen compounds are partially chemically reduced in the cracking stage in the upper gasifier region. Assuming testing confirms successful deployment of all these integrated processes, future IGCC applications will be much simplified, require significantly less mechanical components, and will likely achieve the $1,000/kWe commercialized system cost goal of the GPIF project. This report describes the process and its operation, design of the plant and equipment, site requirements, and the cost and schedule. 23 refs., 45 figs., 23 tabs.

20536 (DOE/MC/30056–4046) **Utilization of lightweight materials made from coal gasification slags. Quarterly report, December 1994–February 1995.** Praxis Engineers, Inc., Milpitas, CA (United States). Mar 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-94MC30056. Order Number DE95009702. Source: OSTI; NTIS; GPO Dep.

Integrated-gasification combined-cycle (IGCC) technology is an emerging technology that utilizes coal for power generation and production of chemical feedstocks. However, this process generates large amounts of solid waste, consisting of vitrified ash (slag) along with some unconverted carbon, which is disposed of as solid waste. The objectives of this project is to demonstrate the technical and economic viability of slag utilization technologies for commercial production of lightweight aggregates (LWA) and ultra-lightweight aggregates (ULWA) from slag and to test the suitability of these aggregates for various applications. The scheduled date for completing Phase I, which includes production of LWA and ULWA from slag at the large pilot-scale, is 14 December 1995. The scheduled start date for Phase II, which involves commercial utilization of these aggregates in a number of applications, is 15 December 1995, and the scheduled completion date of the project is 14 March 1997.

20537 (DOE/METC–95/1013) **MFIX documentation: User's manual.** Syamlal, M. EG and G Technical Services of West Virginia, Inc., Morgantown, WV (United States). Nov 1994. 93p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-90MC26328. Order Number DE95012201. Source: OSTI; NTIS (documentation only); ESTSC (complete software package), P.O. Box 1020, Oak Ridge, TN 37831-1020 (United States); GPO Dep.

MFIX (Multiphase Flow with Interphase exchanges) is a general-purpose hydro-dynamic model for describing chemical reactions and heat transfer in dense or dilute fluid-solids flows, which typically occur in energy conversion and chemical processing reactors. MFIX calculations give time-dependent information on pressure, temperature, composition, and velocity distributions in the reactors. The theoretical basis of the calculations is described in the MFIX Theory Guide. This report, which is the MFIX User's Manual, gives an overview of the numerical technique, and describes how to install the MFIX code and post-processing codes, set up data files and run MFIX, graphically analyze MFIX results, and retrieve data from the output files. Two tutorial problems that highlight various features of MFIX are also discussed.

20538 (DOE/PC/79818–T13) **Bench-scale co-processing economic assessment. Final report.** Gala, H.B.; Marker, T.L.; Miller, E.N. UOP, Inc., Des Plaines, IL (United States). Nov 1994. 269p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-87PC79818. Order Number DE95009312. Source: OSTI; NTIS; GPO Dep.

The UOP Co-Processing scheme is a single-stage slurry catalyzed process in which petroleum vacuum resid and coal are simultaneously upgraded to a high-quality synthetic oil. A highly active dispersed catalyst has been developed which enables the operation of the co-processing unit at relatively moderate and high temperatures and relatively high pressure. Under the current contract, a multi-year research program was undertaken to study the technical and economic feasibility of this technology. All the contractual tasks were completed. Autoclave experiments were carried out to evaluate dispersed vanadium catalysts, molybdenum catalysts, and a less costly UOP-proprietary catalyst preparation technique. Autoclave experiments were also carried out in support of the continuous pilot plant unit operation and to study the effects of the process variables (pressure, temperature, and metal loading on the catalyst). A total of 24 continuous pilot plant runs were made. Research and development efforts during the pilot plant operations were concentrated on addressing the cost effectiveness of the UOP single-stage slurry catalyzed co-processing concept based on UOP experience gained in the previous DOE contract. To this end, effect of catalyst metal concentration was studied and a highly-active Mo-based catalyst was developed. This catalyst enabled successful long-term operation (924 hours) of the continuous bench-scale plant at highly severe operating conditions of 3,000 psig, 465°C temperature, and 2:1 resid-to-MAF (moisture- and ash-free) coal ratio with 0. 1 wt % active metal. The metal loading of the catalyst was low enough to consider the catalyst as a disposable slurry catalyst. Also, liquid recycle was incorporated in the pilot plant design to increase the, reactor back mixing and to increase the flow of liquid through the reactor (to introduce turbulence in the reactor) and to represent the design of a commercial-scale reactor.

20539 (DOE/PC/88802–T9) **Exploratory coprocessing research. Quarterly report Number 9, September 1–November 30, 1990.** Hirschon, A.S.; Tse, D.T.; Malhotra, R.; McMillen, D.F.; Ross, D.S. SRI International, Menlo Park, CA (United States). May 1991. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-88PC88802. Order Number DE95011908. Source: OSTI; NTIS; GPO Dep.

The objectives of this project are to: (1) study the scope of hydrothermal pretreatment of coal on subsequent conversion, (2) identify and study the chemical or physical causes of this effect, and (3) attempt to elucidate the chemistry responsible for any coal-resid synergisms. This project is divided into three tasks. This quarter the authors concentrated on Tasks 2 and 3 as described below. Task 2: chemistry of pretreatment. This Quarter they continued their investigation of the chemistry of pretreatment using an iron catalyst, (ferrous sulfate), both with and without aqueous pretreatment on Wyodak coal. The combination of iron and hydrothermal pretreatment gave the best results, as long as the pretreated coal was not dried prior to conversion. However, the combination of iron and pretreatment gave similar conversions as with pretreatment alone. Task 3: chemistry of synergy. To help provide a baseline for distinguishing between the benefits resulting from chemical and physical solvency factors, the authors decided to conduct some experiments in homogeneous systems, from which they can easily extract the impact due to chemical changes. They synthesized a series of benzyl aromatics and studied their cleavage in a mixture of anthracene and dihydroanthracene. Cleavage rates for the different substrates increase in the order diphenylmethane < benzylnaphthalene < benzylphenanthrene <

benzylpyrene. The log of observed first-order rate constants correlate linearly with the exothermicity of H-addition to the aromatic bearing the benzyl group, and are in excellent agreement with previously modeled results. The experimental results further show the generality of induced bond cleavage, and buttress the view of the possible chemical basis of improvements resulting from increased aromaticity.

20540 (DOE/PC/88802–T10) **Exploratory coprocessing research. Quarterly report Number 10, December 1, 1990–February 28, 1991.** Hirschon, A.S.; Tse, D.T.; Malhotra, R.; McMillen, D.F.; Ross, D.S. SRI International, Menlo Park, CA (United States). May 1991. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-88PC88802. Order Number DE95011909. Source: OSTI; NTIS; GPO Dep.

The objectives of this project are to: (1) study the scope of hydrothermal pretreatment of coal on subsequent conversion, (2) identify and study the chemical or physical causes of this effect, and (3) attempt to elucidate the chemistry responsible for any coal-resid synergisms. This project is divided into three tasks. This quarter the authors concentrated on Tasks 1 and 2 as described below. Task 1: scope of hydrothermal pretreatment. The report contains a preprint submitted to the upcoming ACS meeting in Atlanta describing efforts to evaluate the aqueous pretreatment effect. The results showed that the aqueous pretreatment techniques at 350 C were most effective for the Wyodak coal, with the lignite showing a slight benefit, and the Illinois #6 coal showing essentially no benefit. Task 2: chemistry of pretreatment. This quarter the authors investigated the chemistry of pretreatment using labeled water. In particular, catechol that was treated with and without kaolin and $H_2{}^{18}O$ and was found to have labeled oxygen incorporation. They are aware of no precedents for such a reaction, and suspect that the exchange comes about from an intermediate step where the catechol dimerizes and can lose water in a reversible step. They further suspect that the role of kaolin for the polymerization reaction is to absorb or remove the water in some way so that the reaction is no longer reversible. However, the presence of water reverses the effect. Clays are well known to promote dehydration reactions, so such an explanation is reasonable.

20541 (DOE/PC/89881–T15) **Microbial recovery of metals from spent coal liquefaction catalysts. Final report.** Sperl, P.L.; Sperl, G.T. Geo-Microbial Technologies, Inc., Ochelata, OK (United States). [1995]. 163p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-89PC89881. Order Number DE95014320. Source: OSTI; NTIS; GPO Dep.

This project was initiated on October 1, 1989, for the purpose of recovering metals from spent coal liquefaction catalysts. Two catalyst types were the subject of the contract. The first was a Ni-No catalyst support on alumina (Shell 324), the catalyst used in a pilot scale coal liquefaction facility at Wilsonville, Alabama. The second material was an unsupported ammonium molybdate catalyst used in a pilot process by the Department of Energy at the Pittsburgh Energy Technology Center. This material was obtained in late February 1990 but has not been pursued since the Mo content of this particular sample was too low for the current studies and the studies at the Pittsburgh Energy Technology Center have been discontinued. The object of the contract was to treat these spent catalysts with microorganisms, especially Thiobacillus ferrooxidans , but also other Thiobacillus spp. and possibly Sulfolobus and other potential microorganisms, to leach and remove the metals (Ni and Mo) from the spent catalysts into a form which could be readily recovered by conventional techniques.

20542 (DOE/PC/90027–T12) **Baseline design/economics for advanced Fischer-Tropsch technology. Quarterly report, July–September 1994.** Bechtel National, Inc., Richland, WA (United States); Amoco Research Center, Naperville, IL (United States). [1994]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC90027. Order Number DE95011379. Source: OSTI; NTIS; GPO Dep.

This report is Bechtel's twelfth quarterly technical progress report and covers the period of July through September, 1994. All major tasks associated with the contract study have essentially been completed. Effort is under way in preparing various topical reports for publication. The objectives of this study are to: Develop a baseline design and two alternative designs for indirect liquefaction using advanced F-T technology. The baseline design uses Illinois No. 6 Eastern Coal and conventional refining. There is an alternative refining case using ZSM-5 treatment of the vapor stream from the slurry F-T reactor and an alternative coal case using Western coal from the Powder River Basin. Prepare the capital and operating costs for the baseline design and the alternatives. Individual plant costs for the alternative cases win be prorated on capacity, wherever possible, from the baseline case. Develop a process flowsheet simulation (PFS) model; establish the baseline design and alternatives; evaluate baseline and alternative economics; develop engineering design criteria; develop a process flowsheet simulation (PFS) model; perform sensitivity studies using the PFS model; document the PFS model and develop a DOE training session on its use; and perform project management, technical coordination and other miscellaneous support functions. Tasks 1, 2, 3 and 5 have essentially been completed. Effort is under way in preparing topical reports for publication. During the current reporting period, work progressed on Tasks 4, 6 and 7. This report covers work done during this period and consists of four sections: Introduction and Summary; Task 4 - Process Flowsheet Simulation (PFS) Model and Conversion to ASPEN PLUS; Task 6 - Document the PFS model and develop a DOE training session on its use; and Project Management and Staffing Report.

20543 (DOE/PC/90045–T10) **Catalysts and process development for synthesis gas conversion to isobutylene. Quarterly report, July 1, 1991–September 30, 1991.** Anthony, R.G.; Akgerman, A. Texas A and M Univ., College Station, TX (United States). Research Foundation. 6 Nov 1991. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90045. Order Number DE95012296. Source: OSTI; NTIS; GPO Dep.

The objectives of this project are to develop a new catalyst, the kinetics for this catalyst, simulate the performance of fixed bed trickle flow reactors, slurry flow reactors, and fixed bed gas phase reactors for conversion of a hydrogen-lean synthesis gas to isobutylene. The goals for this year were to recruit and organize the project team, complete the literature and patent searches, complete the management plan and other reporting requirements, complete the revision and upgrading of existing bench scale units for the project, and synthesize, characterize and evaluate the catalytic activity of zirconia prepared (1) by co-precipitation of zirconyl nitrate with ammonium hydroxide and (2) by preparing a hydrous zirconium oxide using the modified sol gel method developed at the Sandia National Laboratories followed by calcination. The same preparation procedure would be used to prepare supports for impregnation with thorium nitrate, a potassium salt and a sodium salt. The synthesis of new crystalline zirconates were to be attempted with the objective of producing new compositions of matter which might have higher activities and selectivities than zirconia. Substantial progress on reactor and kinetic models for slurry and trickle bed reactors was to be achieved. Accomplishments for the year are described.

20544 (DOE/PC/90045–T11) **Catalyst and process development for synthesis gas conversion to isobutylene. Quarterly report, July 1, 1992–September 30, 1992.** Anthony, R.G.; Akgerman, A. Texas A and M Univ., College Station, TX (United States). Research Foundation. 13 Nov 1992. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90045. Order Number DE95012903. Source: OSTI; NTIS; GPO Dep.

A series of zirconia catalysts prepared by a modified sol gel procedure, coprecipitation with ammonium hydroxide, and by a hydrothermal method were evaluated for catalytic activity. These catalysts were prepared containing silicon, thorium, titanium, cerium and the alkali metals. A catalyst containing 2% thorium on zirconia was the most active. The isobutylene and isobutane selectivity were 19.4 wt % and 1.82 wt %, respectively. Macro- and micro-kinetic models indicate that $C0_2$ formation inhibits the rate of CO conversion, hydrogen is dissociatively adsorbed, and CO is molecularly adsorbed. The microkinetic model indicates the strengthening of the metaloxygen bond might increase the production rate of isobutylene.

20545 (DOE/PC/90045–T12) **Catalyst and process development for synthesis gas conversion to isobutylene. Quarterly report, October 1, 1992–December 31, 1992.** Anthony, R.G.; Akgerman, A. Texas A and M Univ., College Station, TX (United States). Research Foundation. 1 Feb 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90045. Order Number DE95012904. Source: OSTI; NTIS; GPO Dep.

The objectives of this project are to develop a new catalyst, the kinetics for this catalyst, reactor models for trickle bed, slurry and fixed bed reactors, and simulate the performance of fixed bed trickle flow reactors, slurry flow reactors, and fixed bed gas phase reactors for conversion of a hydrogen lean synthesis gas to isobutylene. The goals for the quarter include: (1) Conduct experiments using a trickle bed reactor to determine the effect of reactor type on the product distribution. (2) Use spherical pellets of silica as a support for zirconia for the purpose of increasing surface, area and performance of the catalysts. (3) Conduct exploratory experiments to determine the effect of super critical drying of the catalyst on the catalyst surface area and performance. (4) Prepare a ceria/zirconia catalyst by the precipitation method.

20546 (DOE/PC/90045–T13) **Catalyst and process development for synthesis gas conversion to isobutylene. Quarterly report, January 1, 1993–March 31, 1993.** Anthony, R.G.; Akgerman, A. Texas A and M Univ., College Station, TX (United States). Research Foundation. 17 Apr 1993. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90045. Order Number DE95012905. Source: OSTI; NTIS; GPO Dep.

The objectives of this project are to develop a new catalyst, the kinetics for this catalyst, reactor models for trickle bed, slurry and fixed bed reactors, and simulate the performance of fixed bed trickle flow reactors, slurry flow reactors, and fixed bed gas phase reactors for conversion of a hydrogen lean synthesis gas to isobutylene. The six main accomplishments for the quarter are the following: (1) activity testing with the 7% (wt) Ce-ZrO_2, (2) activity testing the same catalyst with CO from an aluminum cylinder, (3) preparation of ZrO_2 by heating zirconyl nitrate, (4) preparation of an active zirconia prepared by a modified sol gel procedure and evaluation of the catalytic activity of a commercial zirconia and the catalysts prepared by the sol gel procedure, (5) determining the effect of separator temperatures and oil flow rate on the performance of a trickle bed reactor, and (6) calculation of the equilibrium composition of the C_2 to C_5 olefins, and initiation of the development of a macrokinetic model. The details of each of these accomplishments are discussed.

20547 (DOE/PC/90045–T14) **Catalyst and process development for synthesis gas conversion to isobutylene. Final report, September 1, 1990–January 31, 1994.** Anthony, R.G.; Akgerman, A. Texas A and M Univ., College Station, TX (United States). Research Foundation. 6 May 1994. 148p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90045. Order Number DE95012906. Source: OSTI; NTIS; GPO Dep.

Previous work on isosynthesis (conversion of synthesis gas to isobutane and isobutylene) was performed at very low conversions or extreme process conditions. The objectives of this research were (1) determine the optimum process conditions for isosynthesis; (2) determine the optimum catalyst preparation method and catalyst composition/properties for isosynthesis; (3) determine the kinetics for the best catalyst; (4) develop reactor models for trickle bed, slurry, and fixed bed reactors; and (5) simulate the performance of fixed bed trickle flow reactors, slurry flow reactors, and fixed bed gas phase reactors for isosynthesis. More improvement in catalyst activity and selectivity is needed before isosynthesis can become a commercially feasible (stand-alone) process. Catalysts prepared by the precipitation method show the most promise for future development as compared with those prepared hydrothermally, by calcining zirconyl nitrate, or by a modified sol-gel method. For current catalysts the high temperatures (>673 K) required for activity also cause the production of methane (because of thermodynamics). A catalyst with higher activity at lower temperatures would magnify the unique selectivity of zirconia for isobutylene. Perhaps with a more active catalyst and acidification, oxygenate production could be limited at lower temperatures. Pressures above 50 atm cause an undesirable shift in product distribution toward heavier hydrocarbons. A model was developed that can predict carbon monoxide conversion an product distribution. The rate equation for carbon monoxide conversion contains only a rate constant and an adsorption equilibrium constant. The product distribution was predicted using a simple ratio of the rate of CO conversion. This report is divided into Introduction, Experimental, and Results and Discussion sections.

20548 (DOE/PC/90054–T6) **Novel nanodispersed coal liquefaction catalysts: Molecular design via microemulsion-based synthesis. Technical progress report, January 1992–March 1992.** Osseo-Asare, K.; Boakye, E.; Radovic, L.R. Pennsylvania State Univ., University Park, PA (United States). Dept. of Materials Science and Engineering. May 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90054. Order Number DE95014742. Source: OSTI; NTIS; GPO Dep.

The objective of this project is to pursue the development of highly dispersed and inexpensive catalysts for improved coal solubilization and upgrading of coal liquids. A novel study of the synthesis of liquefaction catalysts of manometer size will be carried out. It is based on the molecular design of reverse micelles (microemulsions). These surfactant-stabilized, metal-bearing microdrops offer unique opportunities for synthesizing very small particles by providing a cage-like effect that limits particle nucleation, growth and agglomeration. The emphasis will be on iron- and molybdenum-based catalysts, but the techniques to be developed should also be generally applicable. The size of these very small and monodispersed particles will be accurately determined both separately and after in situ and ex situ coal impregnation. The as-prepared nanoparticles as well as the catalyst-impregnated coal or char matrix will be characterized using the following techniques: dynamic light scattering, x-ray diffraction, x-ray photoelectron spectroscopy, scanning and/or transmission electron microscopy, and selective chemisorption. Catalytic activity tests will be conducted under standardized conditions in both hydrogenation and hydrodesulfurization reactions. The effect of particle size of these unsupported catalysts on the product yield and distribution during liquefaction of a bituminous and a subbituminous coal will thus be quantitatively determined.

20549 (DOE/PC/90054–T7) **Novel nanodispersed coal liquefaction catalysts: Molecular design via microemulsion-based synthesis. 20555 (DOE/PC/90293–T15) **High-temperature membranes for H_2S and SO_2 separations. Final report.** Winnick, J. Georgia Inst. of Tech., Atlanta, GA (United States). Jan 1995. 206p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90293. Order Number DE95009310. Source: OSTI; NTIS; GPO Dep.

Electrochemical cells which separate H_2S and $S0_2$ from hot gas streams have two important materials issues that limit their successful industrial application: (1) membranes and (2) electrodes. These were the focus of the present study. For the H_2S work, experimental analysis incorporated several membrane and electrode materials; densified zirconia provided the best matrices for entrainment of electrolytic species, ionic mobility, and a process-gas barricade hindering the capabilities of gas cross-over, alternate reactions. Electrode materials of lithiated Ni converted to NiO in-situ were successful in polishing applications; however H_2S levels >100 ppM converted the NiO cathode to a molten nickel sulfide necessitating the use of Co. Lithiated NiO for the anode material remained morphologically stable and conductive in all experimentation. High temperature electrochemical removal of H_2S from coal gasification streams has been shown on the bench scale level at the Georgia Institute of Technology utilizing the aforementioned materials. Experimental removals from 1000 ppM to 100 ppM H_2S and 100 ppM to 10 ppM H_2S proved over 90% removal with applied current was economically feasible due to high current efficiencies (~100%) and low polarizations. For the $S0_2$work, an extensive search was conducted for a suitable membrane material for use in the $S0_2$ removal system. The most favorable material found was Si_3N_4, proven to be more efficient than other possible materials. New lithiated NiO electrodes were also developed and characterized, proving more stable than previously used pervoskite electrodes. The combination of these new components led to 90% removal at near 100% current efficiency over a wide range of current densities.

20556 (DOE/PC/91051–T8-Vol.1) **Advanced liquefaction using coal swelling and catalyst dispersion techniques. Volume 1, Final technical report, October 1, 1991–September 30, 1994.** Curtis, C.W. (Auburn Univ., (United States)); Gutterman, C.; Chander, S. Amoco Oil Co., Naperville, IL (United States). Research and Development Dept. [1994]. 364p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91051. Order Number DE95009446. Source: OSTI; NTIS; GPO Dep.

The overall objective of this project was to develop a new approach for the direct liquefaction of coal to produce an all-distillate product slate at a sizable cost reduction over current technology. The approach integrated coal selection, pretreatment, coal swelling with catalyst impregnation, liquefaction, product recovery with characterization, alternate bottoms processing, and a technical assessment including an economic evaluation. Heterofunctional solvents were the most effective in swelling coals. Also solvent blends such as isopropanol/water were more effective than pure solvents alone. Impregnating slurry catalysts simultaneously during coal swelling showed that better uptake was achieved with nonswelling solvent and higher impregnation temperature. Some enhancement in initial coal conversion was seen liquefying SO_2-treated Black Thunder coal with slurry catalysts, and also when hydrogen donor liquefaction solvents were used. Noncatalytic reactions showed no benefit from SO_2 treatment. Coupling coal swelling and SO_2 treatment with slurry catalysts was also not beneficial, although high conversion was seen with continuous operation and long residence time, however, similar high conversion was observed with untreated coal. SO_2 treatment is not economically attractive unless it provides about 17% increase in coal reactivity. In most cases, the best results were obtained when the coal was untreated and the slurry catalyst was added directly into the reactor. Foster Wheeler's ASCOT process had better average liquid yields than either Wilsonville's vacuum tower/ROSE combination or delayed coking process. This liquid product also had good quality.

20557 (DOE/PC/91051–T9) **Advanced liquefaction using coal swelling and catalyst dispersion techniques. Quarterly progress report, July–September 1993.** Curtis, C.W. (Auburn Univ., (United States)); Gutterman, C.; Chander, S. Amoco Oil Co., Naperville, IL (United States). Research and Development Dept. [1993]. 80p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91051. Order Number DE95011907. Source: OSTI; NTIS; GPO Dep.

The overall objective of this project is to develop a new approach for the direct liquefaction of coal to produce an all-distillate product slate at a sizable cost reduction over current technology. The approach integrates coal selection, pretreatment, coal swelling with catalyst impregnation, liquefaction, product recovery with characterization, alternate bottoms processing, and carrying out a technical assessment including an economic evaluation. The primary coal of this program, Black Thunder subbituminous coal, can be effectively beneficiated to about 3.5 wt% ash using aqueous sulfurous acid pretreatment. This treated coal can be further beneficiated to about 2 wt% ash using commercially available procedures. All three coals used in this study (Black Thunder, Burning Star bituminous, and Martin Lake lignite) are effectively swelled by a number of solvents. The most effective solvents are those having hetero-functionality. laboratory- and bench-scale liquefaction experimentation is underway using swelled and catalyst impregnated coal samples. Higher coal conversions were observed for the SO_2-treated subbituminous coal than the raw coal, regardless of catalyst type. Conversions of swelled coal were highest when Molyvan L, molybdenum naphthenate, and nickel octoate, respectively, were added to the liquefaction solvent. The study of bottoms processing consists of combining the ASCOT process which consists of coupling solvent deasphalting with delayed coking to maximize the production of coal-derived liquids while rejecting solids within the coke drum. The asphalt production phase has been completed; representative product has been evaluated. The solvent system for the deasphalting process has been established. Two ASCOT tests produced overall liquid yields (63.3 wt% and 61.5 wt%) that exceeded the combined liquid yields from the vacuum tower and ROSE process.

20558 (DOE/PC/91055–T11) **Role of the resid solvent in catalytic coprocessing with finely divided catalysts. Quarterly report, January–March 1995.** Curtis, C.W. Auburn Univ., AL (United States). Dept. of Chemical Engineering. [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91055. Order Number DE95014329. Source: OSTI; NTIS; GPO Dep.

The research reported in this progress report describes the continuation of coal-resid coprocessing reactions that were discussed in the July to September 1994 Quarterly Report. During previous quarters, Maya and FHC-623 resids were evaluated in noncatalytic and catalytic reactions at 400°C with Pittsburgh No. 8 and DECS-17 Blind Canyon coals. From the complete reaction matrix containing the two coals and two resids, it was found that the influence of resids on coprocessing depended on the type of coal used; for example, under catalytic reaction conditions, the hexane solubles of Maya resid increased coal conversion of Pittsburgh No. 8 coal but decreased that of DECS-17. In order to observe the intrinsic behavior of resids during coprocessing, another resid, Manji, and another coal, Illinois No. 6, are being tested. These reactions were begun this quarter. The results obtained are reported in this report.

20559 (DOE/PC/91311–T14) **Configurational diffusion of asphaltenes in fresh and aged catalyst extrudates. Quarterly progress report, December 20, 1994–March 20, 1995.** Guin, J.A. Auburn Univ., AL (United States). Dept. of Chemical Engineering. [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91311. Order Number DE95015613. Source: OSTI; NTIS; GPO Dep.

This quarter, GPC column efficiency and resolution were tested. Better resolution and separation of petroleum asphaltenes were obtained in GPC by connecting four columns (1000Å, 1000Å, 500Å, 500Å pore sizes, respectively) in series. A good linear column calibration curve was obtained using several polystyrene standards

with molecular weights ranging from 500 to 5 x 10^4. The molecular weight distribution of a petroleum asphaltenes was approximated by the polystyrene calibration curve.

20560 (DOE/PC/92149–T9) **Deashing of coal liquids with ceramic membrane microfiltration and diafiltration. Final quarterly technical progress report, October 1–December 31, 1994.** CeraMem Corp., Waltham, MA (United States). [1994]. 801p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC92149. Order Number DE95015612. Source: OSTI; NTIS; GPO Dep.

Diafiltration experiments were done to determine how much particulate- free oil could be extracted from the solids-containing stream. The 0. 05 μm titania membrane was used for the concentration/diafiltration process runs at 270 C, 80 psig inlet pressure, and 6 gpm crossflow. Five concentration process runs were conducted. After the initial run, the concentrated material was diluted with hydrotreated start-up oil from the final solids back to 10% solids. The concentration was limited by increased pressure drop with increased solids content and plugged membrane module channels. Solids retention was greater than 99.5% for all samples. Attempts to clean membranes with solvent failed due to lack of time. Samples of the permeate and concentrate streams were taken for analysis; the diluent had a similar bp range to the coal liquids in the atmospheric bottoms; thus, distillation could not be used to separate the bottoms from the diluent.

20561 (DOE/PC/93218–6) **Photochemical coal dissolution. Quarterly technical progress report, January 1–March 31, 1995.** Doetschman, D.C. State Univ. of New York, Binghamton, NY (United States). Dept. of Chemistry. 23 Mar 1995. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93PC93218. Order Number DE95012429. Source: OSTI; NTIS; GPO Dep.

Progress on the performance of the coal photochemical extractions this quarter has fallen behind schedule. Work on the project scheduled for other times has been pursued instead. At the beginning of the quarter, the sealing off of an undesirable solvent flow pathway in the Ace Glass photochemical reactor was unsuccessful. Due either to pre-existing strains in the glass or to poor procedure, the reactor was damaged beyond repair and a new system was ordered immediately. Shortly after experiments began with the new system, a port of the new Ace Glass reactor equipped with a screwed-down tightened O-ring seal snapped off, a situation clearly due to a poorly annealed glass join. The reactor is presently still under return for repair. The graduate student on the project has put his energies into other project-related work. One type of work was to prepare the extracts that will be needed in future coal photoextractions. The third type of alternate activity on which the P.I. and graduate student have been working is literature work and discussion of the project. These have focused on the probable mechanisms of (1) the direct coal irradiation photolysis, (2) the extract-sensitized coal photolysis, and (3) solvent-sensitized coal photolysis. Considerations have revolved around how free radicals generated from photoexcited coal, coal extract or solvent species cause coal breakdown. How these radicals may perform some of the functions of free radicals in thermal, catalytic coal hydrogenation liquefaction is becoming clearer.

20562 (DOE/PC/94206–T2) **Supercritical fluid reactions for coal processing. Quarterly progress report, January 1, 1995–March 31, 1995.** Eckert, C.A. Georgia Inst. of Tech., Atlanta, GA (United States). School of Chemical Engineering. [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-94PC94206. Order Number DE95015614. Source: OSTI; NTIS; GPO Dep.

Exciting opportunities exist for the application of supercritical fluid (SCF) reactions for the pre-treatment of coal. Utilizing reactants which closely resemble the organic sulfur and nitrogen containing components of coal, we propose to develop a method to tailor chemical reactions in supercritical fluid solvents for the specific application of coal desulfurization and denitrogenation. Diels-Alder reactions involving such compounds have been extensively studied and characterized in liquids. However, there is very little understanding of such reactions in SCF'S. We are developing an approach which will allow optimum design of coal desulfurization and denitrogenation processes.

20563 (DOE/PC/94209–T2) **Regulation of coal polymer degradation by fungi, Second quarterly report, [October–December 1994].** Bumpus, J.A. (University of Northern Iowa, Cedar Falls, IA (United States). Dept. of Chemistry). Notre Dame Univ., IN (United States). 26 Jan 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-94PC94209. Order Number DE95012252. Source: OSTI; NTIS; GPO Dep.

Since our last quarterly report our research activities have focused on characterization of coal macromolecule by P. chrysosporium in vivo in ;two different culture media and by sodium oxalate in vitro. Wood rotting fungi mediate solubilization of low rank coal by secreting oxalic acid which chelates metal ions whose chelating metal ions oxalic acid breaks these ionic bridges rendering the coal macromolecules water soluble. Thus solubization by sodium oxalate in vitro represents a biomimetic process.

20564 (DOE/PC/94219–T2) **Separation of Fischer-Tropsch wax from catalyst by supercritical fluid extraction. Technical progress report, January–March 1995.** Thies, M.C. Clemson Univ., SC (United States). Dept. of Chemical Engineering. [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-94PC94219. Order Number DE95015610. Source: OSTI; NTIS; GPO Dep.

Objective is to evaluate the potential of supercritical fluid extraction for separating the catalyst slurry of a Fischer-Tropsch (F- T) slurry bubble column reactor into a wax and a concentrated catalyst slurry that is ready for recycle/regeneration. The automated apparatus was evaluated using a toluene-petroleum pitch system. The Statistical Associating Fluid Theory (SAFT) equation will be used to fit the VLE and LLE data for F-T wax-solvent systems; this equation was successful in predicting both phase compositions and average molecular weight distributions.

20565 (LBL–37027) **Fundamental studies of the mechanism of catalytic reactions with catalysts effective in the gasification of carbon solids and the oxidative coupling of methane. Quarterly report, July 1, 1994–September 30, 1994.** Iglesia, E.; Perry, D.L.; Heinemann, H. Lawrence Berkeley Lab., CA (United States). Sep 1994. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95012759. Source: OSTI; NTIS; GPO Dep.

Research continued on the study of catalysts and membrane materials involved in the oxidative coupling of methane and coal gasification processes. Membranes studied and fabricated included Sr-Zr-Y-O, Sr-Zr-Y, and Sr-Ce-Y-O systems.

20566 (LBL–37028) **Fundamental studies of the mechanism of catalytic reactions with catalysts effective in the gasification of carbon solids and the oxidative coupling of methane. Quarterly report, October 1, 1994–December 31, 1994.** Iglesia, E.; Perry, D.L.; Heinemann, H. Lawrence Berkeley Lab., CA (United States). Dec 1994. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95012760. Source: OSTI; NTIS; GPO Dep.

This report describes research on the oxidative coupling of methane and catalysts involved in coal gasification. Topics include methane pyrolysis and catalysts, and magnetic properties of the coal gasification catalyst Ca-Ni-K-O system.

20567 (NEDO-C–9213) **Encouragement subsidies for the coal production/utilization. Next-generation coal utilization technology (first next-generation coal technology committee).** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1993. 77p. (In Japanese). Order Number DE95786803. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

The present investigation report is a record of evaluation, discussion and deliberation in the first next-generation coal technology committee for the next-generation coal utilization, which was set forth by NEDO's 'Next-Generation Coal Technology Development Investigation' in fiscal 1993. In addition to the coal liquefaction and gasification both of which are being technologically developed by

the NEDO, this committee is to solve the environmental problem raised by the utilization of coal energy, expected to be increasingly consumed from now on, and design the measures for stabilizing the energy supply and demand. Then, they are to technologically evaluate, as a 'clean coal technology (CCT)', the next-generation coal utilization which innovatively covers the light load on environment, and both high-efficiency combustion and utilization of CO2 at the beginning of the 21st century. In the present first committee, the topping combustion, oxygen combustion, multi-function pyrolysis and coal cleaning were deliberated, while how to take the action for the NEDO-promoted CCT was discussed as a future plan of NEDO's next-generation coal technology development.

20568 (NEDO-C–9330) **Potential study of an environment harmony type coal utilization system. Potential study of an environment harmony type coal utilization system in the industrial sector in China.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Jun 1994. 635p. (In Japanese). Order Number DE95786811. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

An investigational study was conducted on a coal utilization system for environmental measures and improvement of efficiency in coal utilization in China. The present situation of the coal industry in a model area (Shandong Province) was surveyed. A model coal department was selected and a field survey was made. As a result, the following were proposed to the coal utilization system which the model coal department introduces: in the coal preparation field, jig is operated from manually to automatically. Unselected fine particle is treated by the high-grade reforming OA method. In the coal processing field, coal briquette produced by mixing desulfurizer into fine particle, change from the batch system to the continuing production system in the activated carbon plant. Execution of flotation, CWM production and introduction of a pipeline transportation system. As to coal combustion technology, introduction of the circulating fluidized bed boiler system. With relation to coal gasification technology, introduction of a system in which both ammonia and town gas are produced. In the coal ash utilization field, introduction of a plant of flue gas desulfurization sludge mixed sediment substituting materials, etc. 38 refs., 262 figs., 210 tabs.

20569 (SAND–95-2138C) **Evaluation of West Virginia University's iron catalyst impregnated on coal.** Stohl, F.V.; Diegert, K.V.; Goodnow, D.C. Sandia National Labs., Albuquerque, NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9508133–1: Coal liquefaction and gas conversion contractor review meeting, Pittsburgh, PA (United States), 29-31 Aug 1995). Order Number DE95013835. Source: OSTI; NTIS; GPO Dep.

The objectives to evaluate and compare the activities/selectivities of fine-particle size catalysts being developed in the DOE/PETC Advanced Research (AR) Coal Liquefaction program by using standard coal liquefaction activity test procedures. Previously reported results have described the standard test procedure developed at Sandia to evaluate fine-particle size iron catalysts being developed in DOE/PETC's AR Coal Liquefaction Program and described the evaluation of several catalysts (commercially available pyrite, University of Pittsburgh's catalyst, Pacific Northwest Laboratories' catalyst) using these procedures. The test uses DECS-17 Blind Canyon Coal, phenanthrene as the reaction solvent, and a factorial experimental design that enables evaluation of a catalyst over ranges of temperature (350 to 400°C), time (20 to 60 minutes), and catalyst loading (0 to 1 wt % on an as-received coal basis). Recent work has focused on the evaluation of West Virginia University's iron catalyst that WVU impregnated on DECS-17 Blind Canyon coal. Results showed good activity for this catalyst including the highest amount of 9,10-dihydrophenanthrene (13.2%) observed in a reaction product and a small but significant catalytic effect for heptane conversion (0.5%). Additional experiments are being performed to enable comparison with previously tested catalysts. Tetrahydrofuran insolubles from selected reactions have been sent to the University of Kentucky for Mossbauer characterization of the iron phases present.

20570 (VTT-PUB–203) **Reactions of fuel bound nitrogen in gasification processes.** Leppaelahti, J. (VTT Energy, Espoo (Finland). Combustion and Conversion Technology). Technical Research Centre of Finland, Espoo (Finland). 1994. 144p. Order Number DE95779233. Source: OSTI; NTIS.

LIEKKI Research Programme, JALO Research Programme.

The formation of nitrogen compounds in fixed-bed and fluidized-bed gasifiers, their removal from hot gas and the formation of NO_x from nitrogen compounds were studied. The report consists of five papers. Paper 1 discusses conversion of peat and wood nitrogen in the fixed-bed gasifier and formation of NO_x, in combustion of gasification gas. In peat gasification, 19-30 whet% of fuel nitrogen was converted to H_3 but only 4 whet% of wood nitrogen formed H_3. HCN conversion was 3-5 whet% for peat and 9-14 whet% for wood. In papers 2 and 3, catalytic decomposition of nitrogen compounds and tars was studied. The activity of several catalytic materials was tested using a side stream of a commercially operated fixed-bed gasifier. The materials tested were iron sinter, iron pellet, ferrous dolomite, dolomite and limestone and, as reference materials, inert silicon carbide and a commercial nickel catalysts. The effect of process parameters on the formation of nitrogen compounds and tars in fluidized-bed air gasification of peat was studied in paper 4. In paper 5, the possibility of converting H_3 to N_2 by adding small amounts of O_2. NO or both to hot gasification product gases was studied by means of gas-phase kinetic modelling.

0105 Products and By-Products

20571 (DOE/EIA–0121(94/4Q)) **Quarterly coal report, October–December 1994.** USDOE Energy Information Administration, Washington, DC (United States). Office of Coal, Nuclear, Electric and Alternate Fuels. 23 May 1995. 181p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012807. Source: OSTI; NTIS; GPO; GPO Dep.

The Quarterly Coal Report (QCR) provides comprehensive information about US coal production, distribution, exports, imports, receipts, prices, consumption, and stocks to a wide audience, including Congress, Federal and State agencies, the coal industry, and the general public. Coke production, consumption, distribution, imports, and exports data are also provided. The data presented in the QCR are collected and published by the Energy Information Administration (EIA) to fulfill data collection and dissemination responsibilities as specified in the Federal Energy Administration Act of 1974 (Public Law 93-275), as amended. This report presents detailed quarterly data for October through December 1994 and aggregated quarterly historical data for 1986 through the third quarter of 1994. Appendix A displays, from 1986 on, detailed quarterly historical coal imports data, as specified in Section 202 of the Energy Policy and Conservation Amendments Act of 1985 (Public Law 99-58). Appendix B gives selected quarterly tables converted to metric tons.

0106 Properties and Composition

20572 (DOE/PC/90287–T18) **Oxidation of coal and coal pyrite mechanisms and influence on surface characteristics. Progress report.** Doyle, F.M. California Univ., Berkeley, CA (United States). Dept. of Materials Science and Mineral Engineering. 28 Feb 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90287. Order Number DE95014324. Source: OSTI; NTIS; GPO Dep.

The objective of this research is to develop a mechanistic understanding of the oxidation of coal and coal pyrite, and to correlate the intrinsic physical and chemical properties of these minerals, along with changes resulting from oxidation, with those surface properties that influence the behavior in physical cleaning processes. Work during the eighteenth quarter has focused on severe oxidation of coal by thermal and chemical treatment, and on investigating the partition of metal ions between such strongly oxidized coal samples and aqueous solutions. This partitioning behavior is being followed to obtain further information on the chemistry of the coal surfaces after different oxidation treatments, for example,

whether partition occurs by an ion-exchange mechanism, or whether the surface is capable of changing the oxidation state of metallic species, with concurrent surface or bulk precipitation.

20573 (DOE/PC/93051–T4) **Maintenance of the coal sample bank and database. Quarterly technical progress report, July 1, 1994–September 30, 1994.** Davis, A.; Glick, D.C. Pennsylvania State Univ., University Park, PA (United States). Coal and Organic Petrology Labs. 27 Feb 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-93PC93051. Order Number DE95010623. Source: OSTI; NTIS; GPO Dep.

This five year project is intended to ensure the availability of well-characterized, high-quality coal samples for public and private coal research. it continues support of the DOE Coal Sample Bank and Database at The Pennsylvania State University. Thirty coal samples will be collected, processed, packaged, and analyzed, and a resulting database will be maintained. These samples and data, as well as 26 samples collected under previous contracts, will be distributed to DOE contractors and others performing coal research. Samples will be chosen to maintain a sample bank of 56 coals representing the major US coal fields and a variety of coal ranks and compositions. In addition to standard analyses, liquefaction tests and organic geochemical analyses will be performed. The samples will be stored to minimize deterioration, and will be monitored annually by proximate, sulfur forms, and gaseous oxygen analysis to evaluate their condition. These samples will be used for additional research on the influence of changes in surface chemistry on surface properties, the influence of sample deterioration on liquefaction properties, and the mechanisms of coal oxidation.

20574 (ANL/ES/CP–86103) **Alternative flue gas treatment technologies for integrated SO_2 and NO_x control.** Markussen, J.M. (USDOE Pittsburgh Energy Technology Center, PA (United States)); Livengood, D.D. Argonne National Lab., IL (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950414–3: 57. annual American power conference, Chicago, IL (United States), 18-20 Apr 1995). Order Number DE95012919. Source: OSTI; NTIS; GPO Dep.

Enactment of the 1990 Clean Air Act Amendments, as well as passage of legislation at the state level has raised the prospect of more stringent nitrogen oxides (NO_x) emission regulations and has fueled research and development efforts on a number technologies for the combined control of sulfur dioxide (SO_2) and NO_x. The integrated removal of both SO_2 and NO_x in a single system can offer significant advantages over the use of several separate processes, including such factors as reduced system complexity, better operability, and lower costs. This paper reviews the status of a number of integrated flue gas cleanup systems that have reached a significant stage of development, focusing on post-combustion processes that have been tested or are ready for testing at the pilot scale or larger. A brief process description, a summary of the development status and performance achieved to date, pending commercialization issues, and process economics (when available) are given for each technology.

20575 (DOE/MC/22118–3942) **Design manual for management of solid by-products from advanced coal technologies.** Radian Corp., Austin, TX (United States). Oct 1994. 305p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-86MC22118. Order Number DE95000037. Source: OSTI; NTIS; GPO Dep.

Developing coal conversion technologies face major obstacles in byproduct management. This project has developed several management strategies based on field trials of small-scale landfills in an earlier phase of the project, as well as on published/unpublished sources detailing regulatory issues, current industry practice, and reuse opportunities. Field testing, which forms the basis for several of the disposal alternatives presented in this design manual, was limited to byproducts from Ca-based dry SO_2 control technologies, circulating fluidized bed combustion ash, and bubbling bed fluidized bed combustion ash. Data on byproducts from other advanced coal technologies and on reuse opportunities are drawn from other sources (citations following Chapter 3). Field results from the 5 test cases examined under this project, together with results from other ongoing research, provide a basis for predictive modeling of long-term performance of some advanced coal byproducts on exposure to ambient environment. This manual is intended to provide a reference database and development plan for designing, permitting, and operating facilities where advanced coal technology byproducts are managed.

20576 (DOE/MC/28162–4013) **Coolside waste management research. Annual report, October 1, 1993–September 1994.** Kentucky Univ., Lexington, KY (United States). Center for Applied Energy Research. 28 Nov 1994. 164p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-91MC28162. Order Number DE95011611. Source: OSTI; NTIS; GPO Dep.

Properties of the waste product fly ash, resulting from fluidized bed combustion, were investigated. Work was initiated to determine if the fly ash could be used as a soil stabilizing material. Leachates, ionic strength, ph value, and compressive strength were evaluated.

20577 (DOE/MC/30251–4034) **High-volume, high-value usage of flue gas desulfurization (FGD) by-products in underground mines: Phase 1, Laboratory investigations. Quarterly report, October–December 1994.** Kentucky Univ., Lexington, KY (United States). Center for Applied Energy Research. Mar 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-93MC30251. Order Number DE95000097. Source: OSTI; NTIS; GPO Dep.

Research under Subtask 2.2, Chemical and Mineralogical Characterization, included further refinement of mineralogical transformation and the initiation of a kinetic study. The expansion of the FGD materials during moisturizing is attributable to three reactions: the hydration of portlandite to slaked lime; the formation of ettringite from fly ash and anhydrite, and; the formation of gypsum from anhydrite. The sequence of these reactions are being examined in a kinetic study. Completion of the first 15 days of study finds the steady decrease in anhydrite with concomitant formation of ettringite (on fly ash surfaces) and gypsum (pore and crack in-fillings). Geotechnical characterization (Subtask 2.3) focused on swell experiments which will model in situ emplacement. Specimens of FGD material have been stored in 3-inch diameter pipe and, after 39 days, 0.5% of axial swell has been recorded with material strengths of 600 to 1,000 psi. Experiments to determine the amount of moisture loss due to the heat of hydration indicate about 9 to 10% of the water is lost. Confined swell tests are also underway with pressures of 15 to 20 psi recorded at 25 days. Work performed under Task 4 (Background for Phase II) included determination of the compressive strengths for the experimental mine roof rock. Values in the 5,000 to 7,500 psi range were found, which is typical for this type of strata in the region. Work on the hydrologic monitoring program (Subtask 4.2) included completion of the hydraulic conductivity assessment of the strata, as well as completion of the monitoring well plan. The highest hydraulic conductivity was found for the Princess No. 3 coal seam with values of 1×10^{-3} feet/min. The weathered sandstone over the coal had conductivities in the 10^{-4} to 10^{-5} feet/min. range.

20578 (DOE/MC/30252–4024) **Management of dry flue gas desulfurization by-products in underground mines. Quarterly report, October–December 1994.** Chugh, Y.; Dutta, D.; Esling, S.; Ghafoori, N.; Paul, B.; Sevim, H.; Thomasson, E. Southern Illinois Univ., Carbondale, IL (United States). Jan 1995. 58p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-93MC30252. Order Number DE95000094. Source: OSTI; NTIS; GPO Dep.

On September 30, 1993, the US Department of Energy, Morgantown Energy Technology Center and Southern Illinois University at Carbondale (SIUC) entered into a cooperative agreement entitled "Management of Dry Flue Gas Desulfurization By-Products in Underground Mines" (DE-FC21-93MC30252). Under the agreement, Southern Illinois University at Carbondale will develop and demonstrate several technologies for the placement of coal combustion

residues in abandoned coal mines, and will assess the environmental impact of such underground residues placement. The major event during the quarter was the demonstration of the SEEC, Inc. technology for loading and transporting coal combustion residues in the SEEC developed Collapsible Intermodal Containers (CIC). The demonstration was held on November 17, 1994, at the Illinois Power Company Baldwin power plant, and was attended by about eighty (80) invited guest. Also during the quarter meetings were held with Peabody Coal Company officials to finalize the area in the Peabody No. 10 mine to be used for the placement of coal combustion residues. Work under the Materials Handling and Systems Economics area continued, particularly in refining the costs and systems configuration and in economic evaluation of various systems using equipment leasing rather than equipment purchases. Likewise, work progressed on residues characterization, with some preparations being made for long-term testing.

20580 (ETDE/JP-mf–95787235) **Forty years of mechanization of coal mines.** Watanabe, T. Coal Mining Research Centre (Japan). Oct 1994. 280p. (In Japanese). Order Number DE95787235. Source: OSTI; NTIS; Available from Coal Mining Research Center, Japan, 2-10, Kanda Jinbocho, Chiyoda-ku, Tokyo, Japan.

As for the mechanism of coal mines in Japan today, techniques are introduced such as iron prop, hinged bar, coal mining, timbering and maintenance of drilling mine roadway, drilling, transport, and slurry transportation. To support working faces with iron frame, friction iron props are introduced, and hinged bar mining is conducted. As machine coal mining, conducted are coal planer mining and cutter mining. Intending unmanned coal mining, self-advancing support is practically applied. Mechanization of steep slope coal mining and hydraulic mining are researched and practically applied. The pneumatic rock drill, hydraulic rock drill and drilling machine (jumbo drill) are used for mechanization of drilling. As loading machine, used are scraper loader, shaker loader, gathering loader, bucket type loader, etc. All cross section advancing machine and ultra-high pressure combined-use advancing machine are used. Bolt timbering is widely used. Together with employment of various types of engines, hydraulic transportation is studied. Technology for mechanizing coal mine in Japan is at a highest level in the world, and therefore efforts should be exerted to make it useful for development of coal mines overseas. 293 refs., 518 figs., 64 tabs.

0130 Transport, Handling, and Storage

20581 (DOE/PC/90184–T18) **Nuclear magnetic resonance study of granular flows. Final report.** Lovelace Insts., Albuquerque, NM (United States). Mar 1995. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90184. Order Number DE95015601. Source: OSTI; NTIS; GPO Dep.

We have demonstrated the efficacy of NMRI to granular flow studies of objects that yield NMR signals (seeds, pharmaceutical pills) in confined spaces (rotating cylinders, shaking boxes). Excellent results for velocity and concentration of flowing and colliding particles have been obtained non-invasively. We studied flows in geometries that are otherwise impossible to study because of the optical opacity of the materials. In addition, we obtained data for diffusion and collisional losses which must be related to granular temperature. We also measured the global collisional and frictional energy loss for a rotating cylinder containing granular material and compared it to that obtained from the NMRI velocity and acceleration data. We used the same NMR technique to study the interplay between radial and axial segregation of heterogeneous particles in a partially filled rotating cylinder. We also measured flow and diffusion of vibrating particles in the NMRI apparatus to ascertain that such experiments are, indeed, possible. Some theoretical studies were initiated to explain some of the velocity profiles and free surface shapes of rotating drum flow. A direct numerical simulation of the drum flow successfully predicted a number of features, including velocity, concentration, and dissipation profiles in rotating cylinders.

20582 (DOE/PC/92578–T7) **Coal log pipeline research at the University of Missouri. 4th Quarterly report for 1994, October 1, 1994–December 31, 1994.** Liu, H.; Wilson, J.W. Missouri Univ., Columbia, MO (United States). Capsule Pipeline Research Center. [1995]. 109p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93PC92578. Order Number DE95012450. Source: OSTI; NTIS; GPO Dep.

Several factors involved in coal log fabrication, storage and handling, such as curing time, aspect ratio and particle size distribution, were evaluated during the fourth quarter of 1994. When Orimulsion is used for coal log fabrication, a certain period of time is required to build up the strength of coal log. From the test results obtained, the longer the curing period the greater the wear resistance of the coal log. From previous studies, the coal log length to diameter ratio (aspect) was found to be an important factor affecting coal log performance during the pipeline degradation test. From the 2 inches pipeline degradation test results, coal logs with aspect ratios ranging from 1.6 to 2.2 traveled in a more stable manner, and had lower weight loss than coal logs with aspect ratios less than 1.6. The influence of particle size on the performance of a coal log was evaluated to determine the optimum particle size for coal log fabrication, based on practical and economical considerations.

20583 (MAE–304) **Couette flows of a granular monolayer: An experimental study.** Elliott, K.E.; Ahmadi, G.; Kvasnak, W. Clarkson Univ., Potsdam, NY (United States). Dept. of Mechanical and Aeronautical Engineering. Mar 1995. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91297 ; FG22-94PC94213. Order Number DE95015963. Source: OSTI; NTIS; GPO Dep.

An experimental study concerning rapid flows of granular materials in a two dimensional planar granular Couette flow apparatus is performed. The device is capable of generating particulate flows in grain-inertia regime at different shearing rates and solid volume fractions. Multi-color spherical glass particles are sheared across an annular test-section for several wall angular velocities. A video recorder is used to record the motion of particles, and consecutive images are stored and analyzed by an image processing technique for evaluating individual grain velocities. Experimental data for the mean velocity, the root mean-square fluctuation velocity components and the solid volume fraction profile are obtained. The resulting mean velocity profiles have a roughly linear variation for the range of solid volume fractions and shear rates studied. The solid volume fraction profiles exhibit nonuniform variations with the highest concentration occuring near the center of the shearing cell. The RMS-fluctuation velocities are roughly constant, with the streamwise fluctuation being somewhat larger than the cross-stream direction. The experimentally measured flow properties are in reasonable agreement with the earlier theoretical and simulation results.

Conceptual designs of advanced combustion systems that utilize coal as a feedstock require high-temperature furnaces and heat transfer surfaces capable of operating at much higher temperatures than those in current coal-fired power plants. The combination of elevated temperatures and hostile combustion environments requires development and application of advanced ceramic materials for heat exchangers in these designs. This paper characterizes the chemistry of coal-fired combustion environments over the wide temperature range of interest in these systems and discusses some of the experimental results for several materials obtained from laboratory tests and from exposures in a pilot-scale facility.

20585 (CONF-940780–9) **Development and testing of a high efficiency advanced coal combustor: industrial boiler retrofit.** Jennings, P.L. (Combustion Engineering, Inc., Windsor, CT (United States). ABB Power Plant Labs.); Borio, R.W.; Miller, B.G.; Scaroni, A.W.; McGowan, J.G. ABB Combustion Engineering, Inc., Windsor, CT (United States). ABB Power Plant Labs. [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91160. Under U.S. Department of Energy, Pittsburgh Energy Technology Center (PETC) support, the development of a High Efficiency Advanced Coal Combustor (HEACC) has been in progress since 1987 at the ABB Power Plant Laboratories. As summarized in previous publications on the subject, the initial work produced an advanced coal firing system that was capable of firing both water-based and dry pulverized coal in an industrial boiler environment. With continued DOE-PETC support, carried out in cooperation with the Energy and Fuels Research Center of The Pennsylvania State University (Penn State), the HEACC burner concept has been used as a major component in a system design intended for industrial-scale, coal fired retrofit applications. The overall objective of the current work is to demonstrate the technical and economic feasibility of retro a gas/oil-designed industrial boiler to burn micronized coal. In this respect, the major technical goals for the combustion system design have included: a compact, easy to retrofit burner design; low NOx generation, while maintaining high combustion efficiency; commercially acceptable combustion air pressure drop and burner turndown ratio; and integration of coal preparation system controls into boiler control system The design of the HEACC burner is based on the well established principle of internal air staging for NOx control.

DOE Contract FC22-87PC79796. Order Number DE95009448. Source: OSTI; NTIS; GPO Dep.

A Clean Coal Technology (CCT) Project has been completed at a 71 MW(e) (net) tangentially fired unit in Hennepin, Illinois. Energy and Environmental Research Corporation (EER) has demonstrated Gas Reburning-Sorbent Injection (GR-SI) to reduce emissions of NO_x and SO_2, by 60 and 50%, respectively. The host unit was Illinois Power's Hennepin Station Unit 1 which normally fires an Illinois bituminous coal containing approximately 3% sulfur. EER designed and retrofitted the GR-SI system, then evaluated its performance over a year-long demonstration. With GR-SI, natural gas is injected into the furnace above the coal burners to reduce NO_x to N_2 and dry hydrated lime sorbent is injected into the upper furnace for SO_2 capture. Natural gas is injected, at a rate corresponding to 18% of the total heat input, to form a fuel rich reducing zone in which NO_x formed in the coal zone is reduced to N_2. Overfire (burnout) air is injected at a higher point in the boiler to burnout fuel combustibles under overall fuel lean conditions. Hydrated Lime, $Ca(OH)_2$, is injected into the upper furnace cavity through front and side wall injectors, at a rate corresponding to a calcium (sorbent) to sulfur (coal) molar ratio of 1.75. Over the year-long GR-SI demonstration the average NO_x reduction was 67%, from the 0.75 lb/MBtu (323 mg/MJ) coal baseline, and the average SO_2 reduction was 53%, from the 5.3 lb/MBtu (2280 mg/MJ) coal baseline. The average calcium utilization with Linwood hydrated lime sorbent was 24%. Low emissions of CO were maintained, with an average of 57 ppM (@ 3% O_2). Reduction of CO_2 emissions of 7%, from 15.6 to 14.5% (@ 3% O_2), was also measured.

20587 (DOE/PC/79796–T42) **Enhancing the use of coals by Gas Reburning: Sorbent Injection. [Quarterly report], July 28–October 1, 1993.** Energy and Environmental Research Corp., Irvine, CA (United States). Feb 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-87PC79796. Order Number DE95012445. Source: OSTI; NTIS; GPO Dep.

Energy and Environmental Research Corporation (EER) has completed demonstrations of Gas Reburning-Sorbent Injection (GR-SI) at two field sites. The discussions which follow pertain to measurements taken from the demonstration at City Water, Light and Power's (CWLP) Lakeside Station Unit 7 in Springfield, Illinois. Environmental monitoring was conducted for two purposes, to satisfy the requirements of operating permits granted by the Illinois Environmental Protection Agency (IEPA) and to verify environmental acceptability of the GR-SI process. The GR-SI demonstration program at Lakeside Unit 7 was performed in three phases. Phase I – Design and Permitting, entailed characterization of the host boiler, then finalization of process and engineering, design of the GR-SI system. Phase I was initiated in June 1987 and completed in March 1989. Phase II – Construction and Startup, was initiated upon completion of design tasks and was completed in February 1993. Phase III – Operation, Data Collection, Reporting and Disposition, was conducted from July 1993 to June 1994. In Phase III, the GR-SI system performance was evaluated initially through optimization tests, which are short-term tests in which specific operating parameters are varied to determine their impact on emissions and boiler performance. The optimization testing included GR only tests, SI only tests, and GR-SI tests. Results from these tests, carried out from July 28 to October 1, 1993, are presented in this report. Following Optimization testing, long-term GR-SI operation was initiated to demonstrate the combined technology over an extended period with the unit under dispatch load control. Long-term GR-SI testing was conducted from October 4, 1993 to June 3, 1994. The long-term environmental monitoring data are presented in a separate report.

20588 (DOE/PC/88697–T10) **Coal-water slurry fuel combustion testing in an oil-fired industrial boiler. Semiannual technical progress report, February 15, 1994–August 15, 1994.** Miller, B.G.; Scaroni, A.W. Pennsylvania State Univ., University Park, PA (United States). Energy and Fuels Research Center. 30 Nov 1994. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-89PC88697. Order Number DE95011388. Source: OSTI; NTIS; GPO Dep.

The Pennsylvania State University is conducting a coal-water slurry fuel (CWSF) program for the United States Department of Energy (DOE) and the Commonwealth of Pennsylvania with the objective of determining the viability of firing CWSF in an industrial boiler designed for heavy fuel oil. The project will also provide information to help in the design of new system specifically configured to fire these clean coal-based fuels. The project consists of four phases: (1) design, permitting, and test planning, (2) construction and start up, (3) demonstration and evaluation (1,000-hour demonstration), and (4) expanded demonstration and evaluation (installing a CWSF preparation circuit, conducting an additional

1,000 hours of testing, and installing an advanced flue gas treatment system). The boiler testing and evaluation will determine if the CWSF combustion characteristics, heat release rate, fouling and slagging behavior, corrosion and erosion tendencies, and fuel transport, storage, and handling characteristics can be accommodated in a boiler system designed to fire heavy fuel oil. In addition, the proof-of-concept demonstration will generate data to determine how the properties of a CWSF and its parent coal affect boiler performance. The economic factors associated with retrofitting boilers will also be evaluated. During this reporting period, the construction of the CWSF preparation circuit (as well as a dry, micronized coal circuit) continued. The CWSF preparation circuit will be completed by November 1,1994. Additional activities included receiving a coal-designed burner and installing it on the demonstration boiler, and working with DOE in selecting pollution control systems to install on the boiler.

20589 (DOE/PC/90155–T13) **Development and testing of commercial-scale, coal-fired combustion systems: Phase 3, Technical progress report, October 1993–December 1993.** Manufacturing and Technology Conversion International, Inc., Columbia, MD (United States). [1993]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90155. Order Number DE95011476. Source: OSTI; NTIS; GPO Dep.

The objective of this Phase III program for the development of a commercial scale, coal-fired combustion system is to develop and integrate all system components from fuel through total system controls building upon the prior Phase I and II development accomplishments of the MTCI pulse combustion technology and to then field test the complete system in order to evaluate its potential marketability. During this 13th quarter, a steam generation cost model was developed to compare the economics of steam production in the commercial-scale, coal-fired pulse combustion system with that in a natural gas- or oil-fired system. The purpose of this model is to define the competitive capital cost range for the MTCI system under a specified set of technical and economic conditions. A current preliminary estimate of the MTCI pulse coal combustion system capital cost turns out to be about $120,000 and this is within the target range of the US commercial boiler market sector. European differential fuel costs are expected to be more favorable. Several conceptual arrangements for coal reburn and char burnout were evaluated. The arrangement was selected based on the following considerations viz. utilization of the existing pulse combustor as is, minimization of footprint and vertical space requirement, good mixing of coal, steam and combustion products in the reburn section, and adequate char residence time in the char burnout section.

20590 (DOE/PC/91160–T5) **Development and testing of a high efficiency advanced coal combustor: Phase 3 industrial boiler retrofit. Quarterly technical progress report No. 11, April 1, 1994–June 30, 1994.** Patel, R. (ABB Combustion Engineering, Windsor, CT (United States). Power Plant Labs.); Borio, R.; Scaroni, A.W.; Miller, B.G.; McGowan, J.G. ABB Combustion Engineering, Inc., Windsor, CT (United States). ABB Power Plant Labs. 23 Sep 1994. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91160. Order Number DE95011927. Source: OSTI; NTIS; GPO Dep.

The objective of this project is to retrofit the previously developed High Efficiency Advanced Coal Combustor (HEACC) to a standard gas/oil designed industrial boiler to assess the technical and economic viability of displacing premium fuels with microfine coal. This report documents the technical aspects of this project during the tenth quarter of the program. The four hundred hours "Proof-of-Concept System Test" under Task 3 was completed during this quarter. The primary objectives were to obtain steady state operation consistently on coal only and increase carbon conversion efficiency from ~95% to the project goal of 98%. This was to be obtained without increasing NO_x emission above the project goal level of 0.6 lbs/MBtu (~425 ppM). The testing was also designed to show that consistent, reliable operation could be achieved as another prerequisite to the demonstration. The data were gathered and analyzed for both economic and technical analysis prior to committing to the long term demonstration. The Economic Evaluation was completed and work started on commercialization plan. During this reporting period, activities included sample analysis, data reduction and interpretation from all the testing during March and April. Following preliminary conclusions are drawn based on results evaluated: coal handling/preparation system can be designed to meet technical requirements for retrofitting microfine coal combustion; boiler thermal performance met requirement; NO_x Emission can meet target of 0.6 lb/MBtu; combustion efficiencies of 95% could be met on a daily average basis, somewhat below target of 98%; economic playback very sensitive to fuel differential cost, unit size, and annual operating hours; and continuous long term demonstration needed to quantify ash effect and how to best handle.

20591 (DOE/PC/92159–T10) **Engineering development of advanced coal-fired low-emission boiler systems. Technical progress report No. 9, September 1994–December 1994.** ABB Combustion Engineering, Inc., Windsor, CT (United States). ABB Power Plant Labs. 27 Mar 1995. 61p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC92159. Order Number DE95010652. Source: OSTI; NTIS; GPO Dep.

The Pittsburgh Energy Technology Center of the U.S. Department of Energy (DOE) has contracted with Combustion Engineering, Inc. (ABB CE) to perform work on the "Engineering Development of Advanced Coal-Fired Low-Emission Boiler Systems" Project and has authorized ABB CE to complete Phase I on a cost-reimbursable basis and Phases II and III on a cost-share basis. The overall objective of the Project is the expedited commercialization of advanced coal-fired low-emission boiler systems. The specified primary objectives are: (1) NO_x emissions not greater than one-third NSPS; (2) SO_x emissions not greater than one-third NSPS; (3) Particulate emissions not greater than one-half NSPS. The specific secondary objectives are: (1) Improved ash disposability and reduced waste generation; (2) Reduced air toxics emissions; (3) Increased generating efficiency. The final deliverables are a design data base that will allow future coal-fired power plants to meet the stated objectives and a preliminary design of a Commercial Generation Unit. The work in Phase I covered a 24-month period and included system analysis, RD&T Plan formulation, component definition, and preliminary Commercial Generating Unit (CGTJ) design. Phase II will cover a 15-month period and will include preliminary Proof-of-Concept Test Facility (POCTF) design and subsystem testing. Phase III will cover a 9-month period and will produce a revised CGU design and a revised POCTF design, cost estimate and a test plan. Phase IV, the final Phase, will cover a 36-month period and will include POCTF detailed design, construction, testing, and evaluation.

20592 (DOE/PC/92159–T11) **NOx control subsystem test plan: LEBS Phase II.** Combustion Engineering, Inc., Windsor, CT (United States). 16 Mar 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC92159. Order Number DE95012419. Source: OSTI; NTIS; GPO Dep.

It is planned that NO_x control subsystem testing in support of Phase II of the Low-Emissions Boiler Systems (LEBS) Project occur in ABB Power Plant Laboratories' (PPL) pilot scale Boiler Simulation Facility (BSF). This work will be performed to provide necessary design and operational information for inclusion of an optimized NO, control subsystem in the Proof-of-Concept Test Facility (POCTF) and Commercial Generating Unit (CGU) designs. The BSF is a 50 to $90x10^6$ BTU/hr (15 to 26 MWt) coal, oil or natural gas fired tangential furnace designed to replicate the residence time/temperature history of a utility scale tangentially fired boiler. All major aspects of a typical utility boiler are duplicated in the BSF including the lower furnace, the ash hopper, multiple burner elevations, the arch section, superheater/reheater panels, and the convective heat transfer surfaces. The furnace walls and heat transfer surfaces are cooled by a surrounding water jacket. Steam generated is vented off at atmospheric pressure so that a constant sink temperature of 100°C (212°C) is maintained. The lower furnace water walls are selectively refractory lined to maintain an appropriate furnace gas temperature history. Refractory is required because the sink temperature (100°C) is cooler than that of a typical, utility boiler, and the surface-to-volume ratio of the BSF is greater than that of a utility boiler due to scale effects. For the subject testing, the BSF will be configured as a coal fired

boiler. Design and planning activities associated with the construction of the NO_x control subsystem test unit will continue through June, 1995. Additionally, the schedule for specification of certain low NO_x firing system components was set to allow for precursor, internal and LEBS development activities to occur and subsequently provide necessary design parameters.

20593 (DOE/PC/92528–9) **Char particle fragmentation and its effect on unburned carbon during pulverized coal combustion. Quarterly report, October 1–December 31, 1994.** Mitchell, R.E. Stanford Univ., CA (United States). High Temperature Gasdynamics Lab. Mar 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92528. Order Number DE95012428. Source: OSTI; NTIS; GPO Dep.

The project is intended to satisfy, in part, PETC's research efforts to understand the chemical and physical processes that govern coal combustion. The work is pertinent to the char oxidation phase of coal combustion and focuses on how the fragmentation of coal char particles affects overall mass loss rates and how char fragmentation phenomena influence coal conversion efficiency. The knowledge and information obtained will allow the development of engineering models that can be used to predict accurately char particle temperatures and total mass loss rates during pulverized coal combustion. The overall objectives of the project are: (1) to characterize fragmentation events as a function of combustion environment, (2) to characterize fragmentation with respect to particle porosity and mineral loadings, (3) to assess overall mass loss rates with respect to particle fragmentation, and (4) to quantify the impact of fragmentation on unburned carbon in ash. The knowledge obtained during the course of this project will be used to predict accurately the overall mass loss rates of coals based on the mineral content and porosity of their chars. The work will provide a means of assessing reasons for unburned carbon in the ash of coal fired boilers and furnaces.

20594 (DOE/PC/93226–T6) **Investigation of mineral transformations and ash deposition during staged combustion. Quarterly technical progress report, January 1, 1995–March 31, 1995.** Harb, J.N. Brigham Young Univ., Provo, UT (United States). 4 May 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93PC93226. Order Number DE95014339. Source: OSTI; NTIS; GPO Dep.

Progress during the sixth quarter of a three-year study was made in two task areas: (1) parametric testing of the target coals, and (2) analysis of samples from the combustion tests. A new microanalysis system was acquired (no cost to DOE) and is now functional, although development of analysis routines for the system is still in progress. This system has significantly increased our analytical throughput and has provided increased reliability. Parametric testing of the Pittsburgh No. 8 coal (weathered) was initiated this quarter. Initial analytical results from these tests show sulfur release and iron transformations as a function of test conditions and sampling location. A new supply of Pittsburgh No. 8 coal has been shipped and will be used to contrast behavior between the oxidized (weathered) and unoxidized Pittsburgh fuels. Finally, specific tasks for the next quarter have been identified and reported.

20595 (RISO-R–778(EN)) **Department of Combustion Research annual progress report 1 January - 31 December 1994.** Hauge Madsen, P.; Petersen, S. (eds.). Risoe National Lab., Roskilde (Denmark). Combustion Dept. Mar 1995. 69p. Order Number DE95779213. Source: OSTI; NTIS; Also available from Risoe Library, P.O. Box 49, DK-4000 Roskilde, Denmark.

The Department of Combustion Research performs research and development in the programme area of combustion and gasification. The research is aimed at improving the technical and scientific basis for the design and operation of combustion and gasification plants. The overall objective is to contribute to a reduced environmental impact and improved energy efficiency and economy Basic as well as applied research is performed in a number of projects, which have been structured in two research programmes: Chemical and physical characterization of fuels and processes and Optimization of combustion and gasification technologies. The main research activities and results are surveyed in this Progress Report covering the period of 1 January to 31 December 1994. In addition other activities, equipment and facilities, staff and publications are briefly presented. (au)

20596 (SAND–95-8228) **Coal combustion science quarterly progress report, January 1994–March 1994.** Hardesty, D.R. (ed.); Baxter, L.L.; Davis, K.A.; Hurt, R.H. Sandia National Labs., Albuquerque, NM (United States). Jun 1995. 65p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95010743. Source: OSTI; NTIS; GPO Dep.

Research on coal combustion is reported. Topics include: kinetics and mechanisms of coal char combustion and deposit growth in coal-fired furnaces. Algorithms were developed for ash deposit properties. Chemical transformations and ash deposition were investigated utilizing FTIR spectroscopy and a new probe designed to provide temperatures at four locations and temperature changes of the cooling fluid across the center section of the probe. Spectral emissivity of ashes from several different coals are presented. Scanning electron microscopy images of deposits are also presented.

0150 Economic, Industrial, and Business Aspects

20597 (NEDO-C–9331) **Potential survey of an environment harmony type coal utilization system. Potential survey of an environment harmony type coal utilization system in sectors except the coal industry in China.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Jun 1994. 557p. (In Japanese). Order Number DE95786812. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

To work out a master plan for introducing the coal utilization system to China, a survey was made of a system for improvement of the environment and efficiency in coal utilization in China. With the annual economic growth rate exceeding 12%, China consumes 1.1 billion tons of coal and is faced with the serious environmental problem. To realize the continuable growth, Japan and China agreed on cooperation for the green aid plan which positively supports self-aiding efforts exerted by each country. Based on this, the survey is planned to be made for three years from fiscal 1993 on the economy/energy problem, coal utilization status, various industries and their applicable environmental technologies, and coal distribution status. For improvement of coal utilization efficiency, it is necessary to introduce advanced combustion technology, gasification technology, technology to use coal briquette and coal ash. For environmental measures, required are ash collecting, desulfurization, denitrification technologies, which need plant/equipment investment and running cost. For steady economic growth of China, it is necessary for Japan to have much discussion with China and frame a total scheme on technology transfer from Japan and utilization of by-products, etc. 15 refs., 101 figs., 282 tabs.

20598 (BNL–61521) **A systems approach to risk assessment: Application to methylmercury from coal combustion.** Saroff, L. (Dept. of Energy, Washington, DC (United States)); Lipfert, F.W.; Moskowitz, P.D. Brookhaven National Lab., Upton, NY (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950313–1: 20. international technical conference on coal utilization and fuels systems, Clearwater, FL (United States), 20-23 Mar 1995). Order Number DE95008858. Source: OSTI; NTIS; GPO Dep.

The Department of Energy (DOE) asked Brookhaven National Laboratory (BNL) to perform a probabilistic assessment of the health risks associated with Hg from coal-fired power plants. The objective of the assessment is to estimate the incremental health risks that might ensue from a typical coal-fired power plant, together with their uncertainties, taking into account existing background levels and the actual adverse health effects that have

previously been associated with exposure to various Hg species. Mercury has a long history of association with adverse neurological effects at high exposure levels. The most important current exposure pathway has been found to be ingestion of fish containing methylmercury (MeHg), which is the end product of bioconcentration moving up the aquatic food chain. Mercury can enter natural waters from either industrial discharges or from atmospheric deposition of various inorganic Ho. compounds. Because of the worldwide background and the existence of local emissions sources, Hg deposition must be considered on local, regional and global scales. The regulatory technical challenge presented by methy1mercury is to protect public health without foreclosing an appreciable a portion of the food supply or impacting on the lifestyles of North American native populations. This paper presents an abbreviated account of the DOE/BNL risk assessment, as viewed from a systems perspective. We review the structure of the model, the sources of data used, the assumptions that were made, and the interpretation of the findings. Since publication of the first risk assessment report, we have refined our estimates of local atmospheric dispersion and deposition and "calibrated" the pharmacokinetic portion of the model against observations.

20599 (ETDE-DE–111) **Branch project mining industry: Development of a system for epidemiological analyses in the occupational medicine (SEPIA). Final report.** Piekarski, C. Ruhrkohle AG, Essen (Germany). Jan 1995. 264p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 01HD010. Order Number DE95777859. Source: OSTI; NTIS (US Sales Only).

According to Art. 3 of the German Law on Safety at Work the occupational health physicians are held 'to investigate into the causes of occupational diseases'. The project was designed to develop an instrument in occupational medicine with Ruhrkohle AG, to detect possible health impairments in coalworkers as soon as possible and to judge quantitatively health risks due to occupational exposure. By this way the system supplies a scientifc basis for direct protective measures as well as for discussions in health politics. During the project a data processing system was established, that logs all exposure (stress) and health related (strain) data of the workers sampled routinely by the personnel departements, departements of occupational safety and health dispensaries. The data are stored in the dispensary's computer with the occupational physicians in charge to support daily work and the performing of epidemiological studies. As a result the System for Epidemiological Analyses in Occupational Medicine (SEPIA) was realized which consists of a subsystem in the health dispensary (SEPIA-AMD) and other subsystem designed for epidemiological studies on the company scale in the Institute of Occupational Health with RAG (SEPIA/IfA). SEPIA-AMD provides a computer-assisted-system serving all medical workplaces, exchanging data online between system and all measuring devices for medical diagnostics and storing even all graphical data of these devices. SEPIA-IfA establishes an instrument for occupational epidemiology at the company, i.e. the design and performance of epidemiological studies as well as the development of epidemiological methods. For this purpose a computer system with an entire data base and statistical software for analyses was installed. SEPIA is a modular and highly flexible system which can be easily transfered to other medium or large companies with own occupational health dispensaries. (orig.)

20600 (NREL/SP–440-6642) **Wind energy bibliography.** National Renewable Energy Lab., Golden, CO (United States). May 1995. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE94006896. Source: OSTI; NTIS; GPO Dep.

This bibliography is designed to help the reader search for information on wind energy. The bibliography is intended to help several audiences, including engineers and scientists who may be unfamiliar with a particular aspect of wind energy, university researchers who are interested in this field, manufacturers who want to learn more about specific wind topics, and librarians who provide information to their clients. Topics covered range from the history of wind energy use to advanced wind turbine design. References for wind energy economics, the wind energy resource, and environmental and institutional issues related to wind energy are also included.

Alaska Univ., Fairbanks, AK (United States). May 1995. 433p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-89BC14471. Order Number DE95000123. Source: OSTI; NTIS; GPO Dep.

The primary objective of this project was to develop an integrated database to characterize reservoir heterogeneities resulting from numerous small-scale shallowing-upward cycles (parasequences) comprising the Pennsylvanian Wahoo 1imestone. The Wahoo Limestone is the upper part of an extensive carbonate platform sequence of the Carboniferous Lisburne Group which is widely exposed in the Brooks Range and is a widespread hydrocarbon reservoir unit in the subsurface of the North Slope of Alaska. A leading goal is to determine lateral and vertical variations in the complex mosaic of carbonate facies comprising the Wahoo. Aspects of rock units adjacent to the Wahoo, the underlying Endicott Group and Alapah Limestone and overlying Echooka Formation are also discussed. This report includes an overview of the regional geological framework; a discussion of biostratigraphic results; a summary of diagenetic studies; and preliminary results of comparative studies of a cored well in the Lisburne oil field. A computerized database system (the Wahoo database) was developed and is explained in a users manual. Selected papers are indexed separately for inclusion in the Energy Science and Technology Database.

20602 (DOE/BC/14897–6) **Anisotropy and spatial variation of relative permeability and lithologic character of Tensleep Sandstone reservoirs in the Bighorn and Wind River basins, Wyoming. Annual report, September 15, 1993–September 30, 1994.** Dunn, T.L. Wyoming Univ., Laramie, WY (United States). Jul 1995. 76p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-93BC14897. Order Number DE95000156. Source: OSTI; NTIS; GPO Dep.

The principal focus of this project is to evaluate the importance of relative permeability anisotropy with respect to other known geologic and engineering production concepts. This research is to provide improved strategies for enhanced oil recovery from the Tensleep Sandstone oil reservoirs in the Bighorn and Wind River basins, Wyoming. The Tensleep Sandstone contains the largest potential reserves within reservoirs which are candidates for EOR processes in the State of Wyoming. Although this formation has produced billions of barrels of oil, in some fields, as little as one in seven barrels of discovered oil is recoverable by current primary and secondary techniques. Because of the great range of °API gravities of the oils produced from the Tensleep Sandstone reservoirs, the proposed study concentrates on establishing an understanding of the spatial variation and anisotropy of relative permeability within the Tensleep Sandstone. This research is to associate those spatial distributions and anisotropies with the depositional subfacies and zones of diagenetic alteration found within the Tensleep Sandstone. In addition, these studies are being coupled with geochemical modeling and coreflood experiments to investigate the potential for wellbore scaling and formation damage anticipated during EOR processes (e.g., CO_2 flooding). This multidisciplinary project will provide a regional basis for EOR strategies which can be clearly mapped and efficiently applied to the largest potential target reservoir in the State of Wyoming. Additionally, the results of this study have application to all eolian reservoirs

through the correlations of relative permeability variation and anisotropy with eolian depositional lithofacies.

20603 (DOE/ER/14081–T4) **Models of natural fracture connectivity: Implications for reservoir permeability. Annual report for DOE Basic Energy Sciences, 1990.** Pollard, D.D. (Stanford Univ., CA (United States). Dept. of Applied Earth Sciences); Aydin, A. Stanford Univ., CA (United States). Dept. of Applied Earth Sciences. [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-89ER14081. Order Number DE95012911. Source: OSTI; NTIS; GPO Dep.

Fluid flow through fracture networks in a rock mass depends strongly on the nature of connections between fracture segments and between individual fractures. Therefore the objective of this research project is to develop three dimensional models for natural fracture connectivity using an integrated field, laboratory, and theoretical methodology. The geometric models we have developed are based on detailed field mapping and observations from outcrops of both massive and layered sedimentary rocks, typical of producing oil and gas reservoirs, or of aquifers. Furthermore, we have used computer simulations and laboratory experiments to investigate the physical mechanisms responsible for fracture connectivity (or lack thereof) as single and multiple sets of fractures evolve. The computer models are based on fracture mechanics principles and the laboratory experiments utilize layered composite materials analogous to sedimentary sequences. By identifying the physical mechanisms of connectivity we can relate the degree of connectivity to the geometry, state of stress, and material properties of the reservoir rocks and, in turn, be in a position to evaluate the influence of these factors on fracture permeability.

20604 (DOE/ER/14081–T5) **Models of natural fracture connectivity: Implications for Reservoir permeability. Final report for DOE Basic Energy Sciences, 1992.** Pollard, D.D.; Aydin, A. Stanford Univ., CA (United States). Dept. of Applied Earth Sciences. [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-89ER14081. Order Number DE95012910. Source: OSTI; NTIS; GPO Dep.

Fluid flow through fracture networks in a rock mass de ends strongly on the nature of connections between fracture segments and between individual fractures. Therefore the objective of this research project is to develop three dimensional models for natural fracture connectivity using an integrated field, laboratory, and theoretical methodology. The geometric models we have developed are based on detailed field mapping and observations from outcrops of both massive and layered sedimentary rocks, typical of producing oil and gas reservoirs, or of aquifers. Furthermore, we have used computer simulations and laboratory experiments to investigate the physical mechanisms responsible for fracture connectivity (or lack thereof) as single and multiple sets of fractures evolve. The computer models are based on fracture mechanics principles and the laboratory experiments utilize layered composite materials analogous to sedimentary sequences. By identifying the physical mechanisms of connectivity we can relate the degree of connectivity to the geometry, state of stress, and material properties of the reservoir rocks and, in turn, be in a position to evaluate the influence of these factors on fracture permeability.

20605 (DOE/MC/29078–95/C0469) **Atlas of Northern Gulf of Mexico Gas and Oil Reservoirs: Procedures and examples of resource distribution.** Seni, S.J.; Finley, R.J. Texas Univ., Austin, TX (United States). Bureau of Economic Geology. [1995]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI21-92MC29078. (CONF-950494–23: Natural gas research, development and demonstration contractors review meeting, Baton Rouge, LA (United States), 4-6 Apr 1995). Order Number DE95012999. Source: OSTI; NTIS; GPO Dep.

The objective of the program is to produce a reservoir atlas series of the Gulf of Mexico that (1) classifies and groups offshore oil and gas reservoirs into a series of geologically defined reservoir plays, (2) compiles comprehensive reservoir play information that includes descriptive and quantitative summaries of play characteristics, cumulative production, reserves, original oil and gas in place, and various other engineering and geologic data, (3) provides detailed summaries of representative type reservoirs for each play, and (4) organizes computerized tables of reservoir engineering data into a geographic information system (GIS). The primary product of the program will be an oil and gas atlas series of the offshore Northern Gulf of Mexico and a computerized geographical information system of geologic and engineering data linked to reservoir location.

20606 (ETDE/JP-mf–95786711) **Record of TRC's activities in the fiscal year 1993. Geology and geochemistry laboratory.** Japan National Oil Corp., Tokyo (Japan). 31 Oct 1994. 171p. (In Japanese). Order Number DE95786711. Source: OSTI; NTIS; Available from Japan National Oil Corporation, 2-2, Uchisaiwaicho 2-chome, Chiyoda-ku, Tokyo, Japan.

Technology Research Center belongs to Japan National Oil Corporation, and it is in various activities as a core organ for petroleum development and engineering in Japan. This record is the report of its Geology and Geochemistry Laboratory in fiscal 1993. The outline of the history, facilities, etc., of the Center have been explained in the beginning, and the contents of researches and the various reports of the result in fiscal 1993 have been compiled in the record. For the purpose of developing and improving the technology of prospecting mainly with geology and geochemistry fields, the studies of the following five subjects have continued: 'Tectonic history of sedimentary basins' and 'Basic study on geophysical logging' as the basic R and D; and 'Techniques for interpretation and reconstruction of reservoir development', 'Simulation for integration of generation, migration and accumulation of petroleum' and 'Surface geochemical prospecting' as the applicable R and D. The reports of the 17 subtitles have also been printed. In addition, a 'List of R and D results' has been included such as technical papers published and presented at technical societies; and summarized reports have been printed on various activities such as technology transfer, technical services concerning publication and public information, education and training, and international R and D cooperation. 7 refs., 120 figs., 19 tabs.

Order Number DE95786721. Source: OSTI; NTIS; Available from Japan National Oil Corporation, 2-2, Uchisaiwaicho 2-chome, Chiyoda-ku, Tokyo, Japan.

Technology Research Center (TRC) belongs to Oil Development Corporation and undertakes various activities as the central organization in the field of oil development technology. This report is the annual record of its Reservoir Engineering Laboratory for fiscal 1993 covering the history of the center, the outline of its research

facilities, and then the studies accomplished in fiscal 1993, and the contents and results of said studies. In progress are experiments centering about improvement on the rate of recovery of crude oil and gas from the reservoir and on the adoption and buildup of various software for analyzing equipment and evaluation. Received in fiscal 1993 were 13 research reports including a Routine R and D Theme study 'Development of Reservoir Simulation Models', Main R and D Themes studies 'Advanced Reservoir Evaluation Technology' and 'Horizontal Well Technology', and a special study 'Research on the Improvement of Productivity for Tight Carbonate Reservoir'. As the results, image processing equipment and automatic permeability and pore rate measuring equipment were introduced, software related to oil reservoir simulation and others was developed, and on-the-scene experiments were conducted for the verification of well bottom pressure measuring equipment. 5 refs., 62 figs., 15 tabs.

20609 (NEI-DK–2064) **Status report Nov. 1993 of adsorption of hydrocarbons in chalk reservoirs.** Madsen, L. Danmarks Tekniske Hoejskole, Lyngby (Denmark). Inst. for Geologi og Geoteknik; Danmarks Tekniske Hoejskole, Lyngby (Denmark). Inst. for Mineralindustri. 1993. 53p. Contract ENS-1313/93-0005. Order Number DE95787834. Source: OSTI; NTIS.

EFP-93.

The wettability of calcite is important to the optimization of oil and gas production from chalk reservoirs. The resulting description of the adsorption properties of calcite in chalk reservoirs involved surveying relevant literature and conducting adsorption experiments on selected calcite/water systems using the batch method. A clear description of the calcite surface is not possible using electrokinetic measurements. Recently the adsorption of aromatic hydrocarbons onto synthetic calcite ($CaCO_3$) and αalumina (α-Al_2O_3) form an organic phase was investigated, using the batch method, also the adsorption of aromatic hydrocarbons onto α-alumina and boehmite (γ-AlOOH) from the aqueous phase. These investigations demonstrated that the adsorption properties of the powders could be accurately characterized under the given conditions. It is concluded that (on the basis of the preliminary experiments) adsorption of the negatively charged benzoate, molecule can not take place because Ca^{++} ions present in the bulk solution result in a complex formation according to: $2R\text{-}COO^- + Ca^{++}$ $(R\text{-}COO)_2Ca_{(aq)}$. There is a marked difference between the adsorption capacity of benzoic acid in the aqueous and organic phase, and saturated fatty acid of long chain hydrocarbons behaves differently from the aromatic acid in a calcite/water system. From the literature study it is concluded that the widely differing published results concerning the zeta potential of calcite in aqueous solutions can be explained by variation in the experimental conditions: pH, equilibration time, pCO_2 variations (open/closed systems), composition of electrolyte medium, and the nature of calcite. This not only gives the possibility of conducting adsorption experiments form the aqueous phase, but also shows the relevance of conducting experiments controlling the ruling factors. (AB) 32 refs.

20610 (DOE/BC/14652–15) **Dispersion measurement as a method of quantifying geologic characterization and defining reservoir heterogeneity. Final report.** Menzie, D.E. Oklahoma Univ., Norman, OK (United States). May 1995. 142p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90BC14652. Order Number DE95000141. Source: OSTI; NTIS; GPO Dep.

The main objective of this research project is to investigate dispersion as a method of quantifying geological characterization and defining reservoir heterogeneity in order to enhance crude oil recovery. The dispersion of flow of a reservoir rock (dispersion coefficient and dispersivity) was identified as one of the physical properties of a reservoir rock by measuring the mixing of two miscible fluids, one displacing the other in a porous medium. A rock was 100% saturated with a resident fluid and displaced by a miscible fluid of equal viscosity and equal density. Some specific experiments were performed with unequal densities. Produced fluid was analyzed by refractometer, nuclear reaction, electrical conductivity and X-ray scan. Several physical and flow characteristics were measured on the sand rock sample in order to establish correlations with the measured dispersion property. Absolute permeability, effective porosity, relative permeability, capillary pressure, the heterogeneity factor and electrical conductivity were used to better understand the flow system. Linear, transverse, 2-D and 3-D dispersions were measured and used to characterize the rock heterogeneity of the flow system. A new system of measuring dispersion was developed using a gas displacing gas system in a porous medium. An attempt was also made to determine the dispersion property of an actual reservoir from present day well log data on a producing well. 275 refs., 102 figs., 17 tabs.

20611 (DOE/BC/14852–12) **Scale-up of miscible flood processes for heterogeneous reservoirs. Quarterly report, January 1–March 31, 1995.** Orr, F.M. Jr. Stanford Univ., CA (United States). Dept. of Petroleum Engineering. Apr 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92BC14852. Order Number DE95012151. Source: OSTI; NTIS; GPO Dep.

The current project is a systematic research effort aimed at quantifying relationships between process mechanisms that can lead to improved recovery from gas injection processes performed in heterogeneous Class 1 and Class 2 reservoirs. It will provide a rational basis for the design of displacement processes that take advantage of crossflow due to capillary, gravity and viscous forces to offset partially the adverse effects of heterogeneity. In effect, the high permeability zones are used to deliver fluid by crossflow to zones that would otherwise be flooded only very slowly. Thus, the research effort is divided into five areas: development of miscibility in multicomponent systems; design estimates for nearly miscible displacements; design of miscible floods for fractured reservoirs; compositional flow visualization experiments and simulation of near-miscible flow in heterogeneous systems. The status of the research effort in each area is reviewed briefly. In addition, results from pore-level modelling of three-phase flow in porous media are presented.

20612 (DOE/BC/14883–11) **Surfactant-enhanced alkaline flooding for light oil recovery. Quarterly report, October 1–December 30, 1994.** Wasan, D.T. Illinois Inst. of Tech., Chicago, IL (United States). [1994]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92BC14883. Order Number DE95012165. Source: OSTI; NTIS; GPO Dep.

The overall objective of this project is to develop a very cost-effective method for formulating a successful surfactant-enhanced alkaline flood by appropriately choosing mixed alkalis which form inexpensive buffers to obtain the desired pH (between 8.5 and 12.0) for ultimate spontaneous emulsification and ultra-low tension. In addition, the novel concept of pH gradient design to optimize flood water conditions will be tested. The problem of characterizing emulsions in porous media is very important in enhanced oil recovery applications. This is usually accomplished by externally added or insitu generated surfactants that sweep the oil out of the reservoir. Emulsification of the trapped oil is one of the mechanisms of recovery. The ability to detect emulsions in the porous medium is therefore crucial to designing profitable flood systems. The capability of microwave dielectric techniques to detect emulsions in porous medium is demonstrated by mathematical modelling and by experiments. This quarter the dielectric properties of porous media are shown to be predicted adequately by treating it an an O/W type dispersion of sand grains in water. Dielectric measurements of emulsion flow in porous media show that dielectric techniques may be applied to determine emulsion characteristics in porous media. The experimental observations were confirmed by theoretical analysis.

20613 (DOE/BC/14886–11) **Investigation of oil recovery improvement by coupling an interfacial tension agent and a mobility control agent in light oil reservoirs. Technical progress report, January–March 1995.** Pitts, M.J. Surtek, Inc., Golden, CO (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92BC14886. Order Number DE95012148. Source: OSTI; NTIS; GPO Dep.

Two series of corefloods were performed to improve alkaline-surfactant-polymer oil recovery economics. In these series of corefloods, the objective was to increase oil recovery by changing the chemical injection sequence. An alkaline gradient was evaluated in the first series of corefloods. Radial corefloods using Berea core were performed in which a pre-flush of alkaline-polymer solution was injected before the alkaline-surfactant-polymer solution. 30% pore volume (PV) of 1.0 wt % Na_2CO_3 plus 0.2 wt % Petrostep B-100 plus 500 mg/l Flopaam 3330S was injected followed by 30% PV 500 mg/l Flopaam 3330S. A 5% PV 2.0 wt % Na_2CO_3 plus 500 mg/l Flopaam 3330S followed by 5% PV 1.5 wt % Na_2CO_3 plus 500 mg/l Flopaam 3330S was injected prior to the alkaline-surfactant-polymer solution in the coreflood with an alkaline-polymer pre-flush. A water flush of 1.5 to 2 PV followed chemical injection. The pre-flush objective was to inject sufficient alkali to satiate consumption and to force the surfactant to go through optimum interfacial tension and phase behavior states. Incremental oil recovery increased 24% from 0.106 PV (30.3% waterflood residual oil) to 0.131 PV (38.6% waterflood residual oil) when an alkaline-gradient pre-flush was injected. The effect on the oil recovery economics of an alkaline-polymer pre-flush is shown in Table 2. Oil recovery as well as the mass of alkali and polymer injected increased making the cost per incremental barrel of oil unchanged.

20614 (DOE/BC/14893–6) **Integration of advanced geoscience and engineering techniques to quantify interwell heterogeneity in reservoir models. First annual report, September 29, 1993–September 30, 1994.** Martin, F.D.; Buckley, J.S.; Weiss, W.W.; Ouenes, A. New Mexico Petroleum Recovery Research Center, Socorro, NM (United States). May 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-93BC14893. Order Number DE95000147. Source: OSTI; NTIS; GPO Dep.

The goal of this project is to provide a more quantitative definition of reservoir heterogeneity. This objective will be accomplished through the integration of geologic, geophysical, and engineering databases into a multidisciplinary understanding of reservoir architecture and associated fluid-rock and fluid-fluid interactions. The intent is to obtain a quantitative reservoir description incorporating outcrop, field, well-to-well, and laboratory core and fluid data of widely varying scales. This interdisciplinary effort will integrate geological and geophysical data with engineering and petrophysical results through reservoir simulation to quantify reservoir architecture and the dynamics of fluid-rock and fluid-fluid interactions. A more accurate reservoir description will allow greater accuracy and confidence during simulation and modeling as steps toward gaining greater recovery efficiency from existing reservoirs. A field laboratory, the Sulimar Queen Unit, is available for the field research activities that will be conducted.

20615 (DOE/BC/14951–10) **Integrated approach towards the application of horizontal wells to improve waterflooding performance. Annual report.** Kelkar, M.; Liner, C.; Kerr, D. Tulsa Univ., OK (United States). May 1995. 137p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93BC14951. Order Number DE95000146. Source: OSTI; NTIS; GPO Dep.

This annual report describes the progress during the second year of the project on Integrated Approach Towards the Application of Horizontal Wells to Improve Waterflooding Performance. This project is funded under the Department of Energy's Class I program which is targeted towards improving the reservoir performance of mature oil fields located in fluvial-dominated deltaic deposits. The project involves an integrated approach to characterize the reservoir followed by the drilling of horizontal injection wells to improve production performance. The type of data we have integrated include cross bore hole seismic surveys, geological interpretation based on logs and cores, and engineering information. This report covers the second phase of the project which includes a detailed reservoir description of the field by integrating all the available information, followed by flow simulation of the Self Unit under various operating conditions. Based on an examination of the various operating parameters, we observed that the best possible solution to improve the Self Unit performance is to recomplete and stimulate most of the wells followed by an increase in the water injection rate. Drilling of horizontal injection well, although helpful in improving the performance, was not found to be economically feasible. The proposed reservoir management plan will be implemented shortly.

20616 (DOE/BC/14954–10) **Improved secondary recovery demonstration for the Sooner Unit. Quarterly technical report, January 1, 1995–March 31, 1995.** Diversified Operating Corp., New Raymer, CO (United States). 8 May 1995. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93BC14954. Order Number DE95012547. Source: OSTI; NTIS; GPO Dep.

The objective of this project is to demonstrate the effectiveness of geologically targeted infill drilling and improved reservoir management to obtain maximum oil recovery from the Sooner Unit in the Denver-Julesburg (D-J) Basin. The Sooner Unit Field is located about 100 miles northeast from Denver, Colorado and produces from the fluvial-deltaic Cretaceous "D" Sand formation at an average depth of 6,200 ft. The first phase of the project will involve multi-disciplinary reservoir characterization and recovery identification in which high-density 3-D seismic. detailed stratigraphy and engineering analysis will be used to identify optimum infill well sites and production/withdrawal schedules. One well will be drilled during this phase to obtain data pertinent to seismic activities. The second phase will involve implementation of the selected technologies by drilling geologically targeted infill wells and establishing production/injection schedules. Evaluation of results from the second phase will be performed using reservoir simulation. transient well tests and careful production tests of producing wells. The objective will be to compare the prediction of ultimate recovery resulting from the implementation of these technologies with that which would have occurred in the absence of these technologies. The third phase of the project will involve technology transfer through a series of technical papers and presentations of a short course. Emphasis will be on the economics of the project and implemented technologies. Small to medium sized independents will be targeted. The success of this project and effective technology transfer should prompt-reappraisal of older waterflood projects and implementation of new projects in oil provinces such as the D-J Basin.

20617 (DOE/BC/14955–8) **Applications of advanced petroleum production technology and water alternating gas injection for enhanced oil recovery - Mattoon Oil Field, Illinois. Final report.** Baroni, M. (American Oil Recovery, Inc., Decatur, IL (United States)); Baroni, J.J.; Blake, D.; Miller, B. American Oil Recovery, Inc., Decatur, IL (United States). Mar 1995. 76p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93BC14955. Order Number DE95012158. Source: OSTI; NTIS; GPO Dep.

Phase I results of a $C0_2$-assisted oil recovery demonstration project in selected Cypress Sandstone reservoirs at Mattoon Field, Illinois are reported. The design and scope of this project included $C0_2$ injectvity testing in the Pinnell and Sawyer units, well stimulaton treatments with $C0_2$ in the Strong unit and infill well drilling, completion and oil production. The field activities were supported by extensive $C0_2$-oil-water coreflood experiments, CO_2 oil-phase interaction experiments, and integrated geologic modeling and reservoir simulations. The progress of the project was made public through presentations at an industry meeting and a DOEs contractors' symposium, through quarterly reports and one-to-one consultations with interested operators. Phase II of this project was not implemented. It would have been a water-alternating-gas (WAG) project of longer duration.

20618 (DOE/BC–14958-10) **Green River formation water flood demonstration project, Unita Basin, Utah. Quarterly technical progress report, January 1, 1995–March 31, 1995.** Lomax, J.D.; Nielson, D.L.; Deo, M.D. Lomax Exploration Co., Denver, CO (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93BC14958. Order Number DE95012548. Source: OSTI; NTIS; GPO Dep.

The objective of this project was to understand the successful water flood in the Monument Butte unit and apply it to other units and other reservoirs. Expanding the Monument Butte Water Flood was also one of the objectives. This report provides progress in the areas of field drilling and production results and modeling the boundary unit.

20619 (DOE/BC–14977-4) **Improved efficiency of miscible CO_2 floods and enhanced prospects for CO_2 flooding heterogeneous reservoirs. Quarterly technical progress report, January 1, 1995–March 31, 1995.** Grigg, R.B.; Heller, J.P.; Schechter, D.S. New Mexico Petroleum Recovery Research Center, Socorro, NM (United States). 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-94BC14977. Order Number DE95012549. Source: OSTI; NTIS; GPO Dep.

The objective of this research is to improve the effectiveness of CO_2 flooding in heterogeneous reservoirs. Activities include: exploration of the applicability of selective mobility reduction utilizing foams; possible higher economic viability of floods at slightly reduced CO_2 injection pressures; and taking advantage of gravitational forces during flooding in fractured reservoirs.

20620 (DOE/BC/14983–4) **Recovery of bypassed oil in the Dundee formation using horizontal drains. Second quarterly report, [January–March 1995].** Wood, J.R. Michigan Technological Univ., Houghton, MI (United States). 15 Apr 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-94BC14983. Order Number DE95012157. Source: OSTI; NTIS; GPO Dep.

Well data, including drillers' logs, wireline logs, and seismic data, from the Crystal and 3 0 other Dundee oil fields in the Michigan basin have been acquired. Digitized logs of 336 wells that currently produce or have produced from the Dundee Formation in the seven-county study area have been purchased from Maness Petroleum Company. The data-gathering phase of the well-log program is now complete. Well-log analysis using TerraSciences TerraStation software has begun. Detailed analyses of wells with modern logs are being made using density/porosity and Pickett crossplots. Water saturations were calculated for several wells in the past month. Production data have been added to the well-file database. We now have the capability of mapping production as well as geology. Well-location basemaps with permit numbers were constructed for all 30 fields. Contour maps were completed for all 30 fields during the last quarter, including maps: on the top of the Dundee Formation, the top of the Dundee porosity zone (which is well below the top of the Dundee and varies in stratigraphic position throughout most fields), Dundee to Traverse isopachs, and initial production values before and after well treatment. At least two simple computer-generated cross sections were constructed for each field.

20621 (DOE/BC/14984–3) **Improved recovery demonstration for Williston Basin carbonates. Quarterly report, January 1, 1995–March 31, 1995.** Carrell, L.A.; Nautiyal, C. Luff Exploration Co., Denver, CO (United States). [1995]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-94BC14984. Order Number DE95012156. Source: OSTI; NTIS; GPO Dep.

The purpose of this project is to demonstrate targeted infill and extension drilling opportunities, better determinations of oil-in-place, methods for improved completion efficiency and the suitability of waterflooding in certain shallow-shelf carbonate reservoirs in the Williston Basin, Montana, North Dakota and South Dakota. Cores from five Red River wells in the Bowman-Harding study area have been examined and described in detail; contracts have been awarded for a 3-D survey in Bowman Co., ND and a 2D, multicomponent survey in Richland Co.; extended-time pressure buildup data have been analyzed from two wells which are candidates for jetting-lance completion workovers; a 20-day injectivity test has been completed in the Red River (upper member); a jetting-lance completion program has commenced with one job completed and three more scheduled during April; and reservoir data from three key Red River fields in the Bowman-Harding study area has been researched and accumulated for inclusion in the TORIS database and technology transfer activities.

20622 (DOE/BC/14986–3) **CO_2 Huff-n-Puff process in a light oil shallow shelf carbonate reservoir. 1994 Annual report.** Wehner, S.C. Texaco Exploration and Production, Inc., Midland, TX (United States). May 1995. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-94BC14986. Order Number DE95000142. Source: OSTI; NTIS; GPO Dep.

It is anticipated that this project will show that the application of the CO_2 Huff-n-Puff process in shallow shelf carbonates can be economically implemented to recover appreciable volumes of light oil. The goals of the project are the development of guidelines for cost-effective selection of candidate reservoirs and wells, along with estimating recovery potential. The selected site for the demonstration project is the Central Vacuum Unit waterflood in Lea County, New Mexico. Work is nearing completion on the reservoir characterization components of the project. The near-term emphasis is to, (1) provide an accurate distribution of original oil-in-place on a waterflood pattern entity level, (2) evaluate past recovery efficiencies, (3) perform parametric simulations, and (4) forecast performance for a site specific field demonstration of the proposed technology. Macro zonation now exists throughout the study area and cross-sections are available. The Oil-Water Contact has been defined. Laboratory capillary pressure data was used to define the initial water saturations within the pay horizon. The reservoir's porosity distribution has been enhanced with the assistance of geostatistical software. Three-Dimensional kriging created the spatial distributions of porosity at interwell locations. Artificial intelligence software was utilized to relate core permeability to core porosity, which in turn was applied to the 3-D geostatistical porosity gridding. An Equation-of-State has been developed and refined for upcoming compositional simulation exercises. Options for local grid-refinement in the model are under consideration. These tasks will be completed by mid-1995, prior to initiating the field demonstrations in the second budget period.

20623 (DOE/BC/14986–4) **CO_2 HUFF-n-PUFF process in a light oil shallow shelf carbonate reservoir. Quarterly technical progress report, [January 1, 1995–March 31, 1995].** Cole, R.; Prieditis, J.; Vogt, J.; Wehner, S. Texaco Exploration and Production, Inc., Midland, TX (United States). 21 Apr 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-94BC14986. Order Number DE95012155. Source: OSTI; NTIS; GPO Dep.

The principal objective of the Central Vacuum Unit (CVU) CO_2 Huff-n-Puff (H-n-P) project is to determine the feasibility and practicality of the technology in a waterflooded shallow shelf carbonate environment. The results of parametric simulation of the CO_2 H-n-P process, coupled with the CVU reservoir characterization components will determine if this process is technically and economically feasible for field implementation. The technology transfer objective of the project is to disseminate the knowledge gained through an innovative plan in support of the Department of Energy's (DOE) objective of increasing domestic oil production and deferring the abandonment of shallow shelf carbonate (SSC) reservoirs. Technical progress is reported for geostatitical realizations; paramatric simulation; waterflood review; and reservoir characterization.

20624 (DOE/BC/14991–3) **Design and implementation of a CO_2 flood utilizing advanced reservoir characterization and horizontal injection wells in a shallow shelf carbonate approaching waterflood depletion: Project management/ evaluation plan.** Hallenbeck, L.D.; Harpole, K.J.; Gerard, M.G. Phillips Petroleum Co., Bartlesville, OK (United States). 3 May 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-94BC14991. Order Number DE95012186. Source: OSTI; NTIS; GPO Dep.

The objectives of the Management/Evaluation Plan are: (1) clarify management structure, task responsibilities and schedules, and (2) to be used as a basis for judging the Project Evaluation Report submitted as a part of the continuation application. The components addressed in the report are: management structure; project staff organization; management procedure; quality assurance plan; ES and H plan and environmental compliance reporting; task WBS and logic flow diagram; list and schedule of planned deliverables; diagram of existing facilities; industry interaction; and evaluation of technical and economic feasibility.

20625 (DOE/BC–95000144) **Reservoir characterization and process monitoring with EM methods. 1994 Annual report.** Wilt, M. Lawrence Livermore National Lab., CA (United States). May 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95000144. Source: OSTI; NTIS; GPO; GPO Dep.

During the past five years at Lawrence Livermore National Laboratory (LLNL) the authors have applied the EM induction method to the problem of petroleum reservoir characterization and enhanced oil recovery (EOR) monitoring. The goal is to develop practical tools for determining the electrical resistivity distribution between boreholes at a useful scale for reservoir characterization. During FY94 the authors conducted their largest field test to date. They applied crosshole and surface-to-borehole EM techniques to reservoir characterization at the Los Hills No. 3 oil field making three sets of measurements during the initial phase of the steam drive.From these data they were able to determine the resistivity and configuration of the oil sands, between the observation wells, and provide an image of the subsurface resistivity changes due to the steam drive. They also conducted a waterflood experiment at the Richmond Field Station facility using the borehole-to-surface EM technique. For this test they injected a small quantity of saltwater, and applied the Em technique to monitor the progress of the injected plume. Data collection for this experiment is complete but the results are yet to be interpreted. Finally, a project to understand EM propagation through steel casing was initiated in 1994. The goals of the experiment are to determine the limits and applications for crosswell EM surveys through steel well casing.

20626 (DOE/MC/29252–3954) **Development of a near-bit MWD system. Quarterly report, April 1994–June 1994.** McDonald, W.J.; Pittard, G.T. Maurer Engineering, Inc., Houston, TX (United States). Nov 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC29252. Order Number DE95000045. Source: OSTI; NTIS; GPO Dep.

Horizontal drilling utilized in the oil and gas fields has need of accurate directional placement and drilling conditions at the bit. The preliminary design of a drill bit with a measuring instrument/ telemetry system attached is briefly described.

20627 (ETDE-DE–128) **Multiple phase flow in transition zones occuring in porous media.** Meyn, V.; Hollerbach, A. Institut fuer Erdoelforschung, Clausthal-Zellerfeld (Germany). 1993. 12p. Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 0326595A; Contract EN 3C-0049-D. Order Number DE95780311. Source: OSTI; NTIS (US Sales Only).

The displacement behaviour of carbon dioxid/oil-systems is not only governed by thermodynamical properties of the related phases, but also by the transport behaviour of compounds involved. In contradiction to the results of the theory of multicomponent chromatography not including dispersion, the dispersion results in a continuous change of the concentration of all components. This is valid below and above MMP. Especially the prevention of the separation of methane, ethane and carbon dioxide results in an elongation of the composition path within the homogeneous region of the transition zone. The cross-over into the large methane/oil miscibility gap is avoided, which would lead to an unstable immiscible gas drive at high viscosity- and density differences. The miscibility gap is entered at high CO_2-concentrations resulting in minor interfacial tension in front of the transition zone. (orig.)

20628 (ETDE/JP-mf–95786726) **Record of TRC's activities in the fiscal year 1993. Enhanced recovery laboratory.** Japan National Oil Corp., Tokyo (Japan). 31 Oct 1994. 111p. (In Japanese). Order Number DE95786726. Source: OSTI; NTIS; Available from Japan National Oil Corporation, 2-2, Uchisaiwaicho 2-chome, Chiyoda-ku, Tokyo, Japan.

This is the fiscal 1993 report of Enhanced Recovery Laboratory, in which the history of the center, the outline of the facilities, etc., are stated, and then a report is made about the contents and the results of its researches for fiscal 1993. The laboratory aims at an increased oil recovery rate and at the establishment of enhanced oil recovery (EOR) technology, and, in fiscal 1993, submitted 8 reports under three main themes. In 'Microbial EOR Technology', useful microbes are searched for and oil recovery experiments are conducted using them, in 'Heavy Oil EOR Technology', in addition to field tests at the Ikiztepe oil field, studies related to steam flood and CO2 gas flood are discussed, and, in 'Enhanced Oil Recovery', studies are made in relation to CO2 gas floods and chemical floods that were conducted in Niigata and Akita Prefectures. This report also carries a list of research results, and various activities such as technical service, training and education and international cooperation. 73 figs., 29 tabs.

20629 (ETDE/JP-mf–95786730) **Record of TRC's activities in the fiscal year 1993. Petroleum engineering laboratory.** Japan National Oil Corp., Tokyo (Japan). 31 Oct 1994. 160p. (In Japanese). Order Number DE95786730. Source: OSTI; NTIS; Available from Japan National Oil Corporation, 2-2, Uchisaiwaicho 2-chome, Chiyoda-ku, Tokyo, Japan.

This is the fiscal 1993 annual report that covers Petroleum Engineering Laboratory activities. The laboratory undertakes research and development aiming at cost reduction and operating safety in the technological field related to digging, production, marine exploitation for the production of petroleum and gas. Taken up as typical basic researches in fiscal 1993 are 'Basic Research on Drilling Technology', 'Basic Research on Production Technology', 'Horizontal Well Technology', 'Development of Small Scale Offshore LNG Plant', 'EM-MWD Technology', 'Technologies for Offshore Marginal Oil Field Development', 'Production Technology under High-Temperature and Corrosive Environments', 'Direct Conversion of Natural Gas to Liquid Fuel', and 'Basic Research for Oil Development Technologies in the Arctic Regions'. Sub-themes as many as 23 are also reported in line with the said themes. In addition, a list of the results of researches (papers and patents) and technical service activities are reported. 120 figs., 38 tabs.

20630 (NIPER/BDM–0086, pp. 3-8) **Redeeming features of in situ combustion.** Farouq Ali, S.M. (Univ. of Alberta, Edmonton (Canada)). BDM Oklahoma, Inc., Bartlesville, OK (United States); National Inst. for Petroleum and Energy Research, Bartlesville, OK (United States). Feb 1995. (CONF-940450–: Field application in situ combustion practices: past, present and future applications, Tulsa, OK (United States), 21-22 Apr 1994). In *Field application of in situ combustion – past performance/future application: Proceedings.* 248p. Order Number DE95000130. Source: OSTI; NTIS; GPO Dep.

In situ combustion remains the most tantalizing enhanced oil recovery method. It has been tested extensively - in over 150 field tests - in both heavy and light oil reservoirs. What we have learned from this experience is that in situ combustion works under most conditions, but the nature of the problems is such that it is seldom profitable. Also, looking at many previous in situ combustion tests, steam injection, and even waterflooding, would have been a better choice. Yet in situ combustion has unique features not found in any other EOR method. These must be weighed against its shortcomings to evaluate a potential application. This paper discusses the redeeming features of in situ combustion, in particular the reservoir conditions under which in situ combustion may be superior to other EOR methods are outlined. All variations of in situ combustion - forward, reverse, wet, dry - as well as combinations with other EOR methods are considered. The conclusions is that in situ combustion still has a place, and its future application would depend on research on certain crucial aspects of the process.

20631 (NIPER/BDM–0086, pp. 9-13) **Oxygen enriched fireflooding.** Shahani, G.H. (Air Products and Chemicals, Allentown, PA (United States)); Gunardson, H.H. BDM Oklahoma, Inc., Bartlesville, OK (United States); National Inst. for Petroleum and Energy Research, Bartlesville, OK (United States). Feb 1995. (CONF-940450–: Field application in situ combustion practices: past, present and future applications, Tulsa, OK (United States), 21-22 Apr 1994). In *Field application of in situ combustion – past performance/future application: Proceedings.* 248p. Order Number DE95000130. Source: OSTI; NTIS; GPO Dep.

Both pure oxygen and enriched air have been considered in fireflooding for enhanced oil recovery. Laboratory and field testing have conclusively shown that oxygen is practical and cost effective for this application. For reservoirs that require a large volume of high pressure gas, oxygen is cheaper than air simply based on compression costs. Additional process benefits with oxygen include: Faster Oil Production; Lower Injection Pressure; Greater Well Spacing; Increased Carbon Dioxide Partial Pressure; Lower Gas-to-Oil Ratios; and Purer Produced Gas. These features provide a compelling case for oxygen, once the safety and materials compatibility issues are properly addressed.

20632 (NIPER/BDM–0086, pp. 15-39) **In situ combustion - from pilot to commercial application.** Turta, A. (Petroleum Recovery Institute, Alberta (Canada)). BDM Oklahoma, Inc., Bartlesville, OK (United States); National Inst. for Petroleum and Energy Research, Bartlesville, OK (United States). Feb 1995. (CONF-940450–: Field application in situ combustion practices: past, present and future applications, Tulsa, OK (United States), 21-22 Apr 1994). In *Field application of in situ combustion – past performance/future application: Proceedings.* 248p. Order Number DE95000130. Source: OSTI; NTIS; GPO Dep.

In 1994, there are at least 14 active commercial in-situ combustion (ISC) projects worldwide. A review of these projects is carried out in order to emphasize the important factors which contributed to the success of the processes. The success of the developing an ISC pilot into a commercial ISC project is strongly connected with two factors: (a) starting the operation from the uppermost part of the structure and extending the process downwards and (b) application of the line drive well configuration instead of patterns, whenever is possible. An effective, peripheral line drive operation requires pool utilization. The most challenging phase towards commercialization of an ISC project is the field pilot design, implementation and evaluation. This paper is focused on the advantages of locating ISC pilot at the upper zone of the reservoir, due to the need for a full scale integration of the pilot with the subsequent semi- and commercial development of the process.

20633 (NIPER/BDM–0086, pp. 41-64) **DOE cost-shared in situ combustion projects revisited.** Sarathi, P.S. (NIPER/BDM-Oklahoma, Bartlesville, OK (United States)); Olsen, D.K. BDM Oklahoma, Inc., Bartlesville, OK (United States); National Inst. for Petroleum and Energy Research, Bartlesville, OK (United States). Feb 1995. DOE Contract AC22-94PC91008. (CONF-940450–: Field application in situ combustion practices: past, present and future applications, Tulsa, OK (United States), 21-22 Apr 1994). In *Field application of in situ combustion – past performance/future application: Proceedings.* 248p. Order Number DE95000130. Source: OSTI; NTIS; GPO Dep.

As part of its enhanced oil recovery (EOR) program, the US Department of Energy (DOE) and its predecessor organizations sponsored several cost-shared in situ combustion projects in the 1960s and 1970s. The goal of these projects was to evaluate the technical and economic feasibility of in situ combustion as a thermal oil recovery technique and provide information in the public domain as a means of reducing the risks associated with these high cost ventures. This study reviewed specific features of the cost-shared demonstration and experimental projects, and examined the causes that led to their success or failure. The failed projects were compared with the successful projects under similar settings to further document why these projects failed. The lessons learned were detailed.

20634 (NIPER/BDM–0086, pp. 65-81) **In situ combustion field experiences in Venezuela.** Villalba, M. (INTEVEP, Caracas (Venezuela)); Estrada, M.; Bolivar, J. BDM Oklahoma, Inc., Bartlesville, OK (United States); National Inst. for Petroleum and Energy Research, Bartlesville, OK (United States). Feb 1995. (CONF-940450–: Field application in situ combustion practices: past, present and future applications, Tulsa, OK (United States), 21-22 Apr 1994). In *Field application of in situ combustion – past performance/future application: Proceedings.* 248p. Order Number DE95000130. Source: OSTI; NTIS; GPO Dep.

A literature review of four in situ combustion projects: in Miga, Tia Juana, Melones and Morichal fields in Venezuela was made, and a summary of these projects is presented. Reservoir description and project performance data were analyzed. The behavior of the four in situ combustion field tests can be summarized as follows: The problems most often encountered were corrosion and high temperature producing wells. The direction in which the burning front moved was guided essentially by reservoir characteristics. The produced oil was upgraded by about 4° API, and viscosity was substantially reduced. For Mirochal and Miga fields, the analyses of available information from the combustion projects indicated that the process has been successful in the affected region. Conclusions from this review indicate that the two most frequent problems encountered were operational problems in producing wells and the direction of the burning front. The heterogeneous nature of the sands probably resulted in the burning front moving in a preferential direction, hence reducing areal sweep efficiency.

20635 (NIPER/BDM–0086, pp. 83-96) **Romania - 30 years of experience in in situ combustion.** Machedon, V. (Research and Design Institute for Oil and Gas, Cimpina (Romania)); Popescu, T.; Paduraru, R. BDM Oklahoma, Inc., Bartlesville, OK (United States); National Inst. for Petroleum and Energy Research, Bartlesville, OK (United States). Feb 1995. (CONF-940450–: Field application in situ combustion practices: past, present and future applications, Tulsa, OK (United States), 21-22 Apr 1994). In *Field application of in situ combustion – past performance/future application: Proceedings.* 248p. Order Number DE95000130. Source: OSTI; NTIS; GPO Dep.

Starting with 1963, simultaneous pilot and semi-commercial steam flooding and in situ combustion tests were carried out at Suplacu de Barcau heavy oil field (16° API). The performance of in situ combustion was by far better and as a result, the entire reservoir was designed to produce by this method, by abandoning the "patterns" concept and introducing the "continuous front" concept. Under primary production, the ultimate recovery factor would have been 9.2%, while an ultimate recovery factor of at least 50% is expected by in situ combustion. In situ combustion was applied on three other major reservoirs: Balaria in 1975, East Videle in 1979, and West Videle in 1980. For those reservoirs, as compared to the average ultimate recovery of about 10% under primary production, an average ultimate recovery of at least 35% is expected by in situ combustion. From an important amount of technological studies and site operations, this paper selects and presents comments and remarks related to the strategy of the field development, the "continuous front" or "patterns" system, production monitoring, difficulties encountered, etc. In situ combustion is economically advantageous if the reservoir is carefully selected and the applied technology is of an adequate quality and suitable for the respective reservoir.

20636 (NIPER/BDM–0086, pp. 101-112) **The effect of low-temperature oxidation on the fuel and produced oil during in situ combustion.** Mamora, D.D. (Texas A&M Univ., College Station, TX (United States)); Brigham, W.E. BDM Oklahoma, Inc., Bartlesville, OK (United States); National Inst. for Petroleum and Energy Research, Bartlesville, OK (United States). Feb 1995. (CONF-940450–: Field application in situ combustion practices: past, present and future applications, Tulsa, OK (United States), 21-22 Apr 1994). In *Field application of in situ combustion – past performance/future application: Proceedings.* 248p. Order Number DE95000130. Source: OSTI; NTIS; GPO Dep.

Combustion tube experiments using 10.2° API crude oil were performed, in which a different sample matrix was used in each run. Three matrix types were tested: sand, sand and clay, and sand and sand fines. As a result of the low fuel concentration, low-temperature oxidation (LTO) was observed in the run where the matrix consisted of sand only. High-temperature oxidation (HTO) was observed in runs where either clay or sand fines were part of the matrix. Ignition was not obtained in the LTO run, which had a reaction front temperature of only 350°C (662°F), compared to a combustion front temperature of 500°C (932°F) for the HTO runs. From elemental analysis, the fuel during the LTO run was determined to be an oxygenated hydrocarbon with an atomic oxygen-carbon ratio of 0.3.

20637 (NIPER/BDM–0086, pp. 113-123) **Comprehensive kinetic models for the aquathermolysis of heavy oils.** Belgrave, J.D.M. (Univ. of Calgary, Alberta (Canada)); Moore, R.G.; Ursenbach, M.G. BDM Oklahoma, Inc., Bartlesville, OK (United States); National Inst. for Petroleum and Energy Research, Bartlesville, OK (United States). Feb 1995. (CONF-940450–: Field application in situ combustion practices: past, present and future applications, Tulsa, OK (United States), 21-22 Apr 1994). In *Field application of in situ combustion – past performance/future application: Proceedings.* 248p. Order Number DE95000130. Source: OSTI; NTIS; GPO Dep.

Aquathermolysis experiments over the temperature range 360 to 422°C were performed on core samples taken from three large bitumen and heavy oil deposits found in Alberta: Athabasca, North

Bodo, and Frisco Countess. The purpose of this work was to facilitate the development of comprehensive thermal cracking models for predicting gas and liquid phase product distributions under conditions anticipated during thermal recovery. Previous studies have shown by material balance on oxygen that water is implicated in many of the chemical reactions leading to the formation of H_2S and CO_2, yet most of the reported thermal cracking studies have not included water. Additionally, experimental investigations in this area have, for the most part, not involved realistic time frames, and as such certain phenomena observed in this work have not been previously reported.

20638 (NIPER/BDM–0086, pp. 127-142) **An evaluation of the benefits of combined steam and fireflooding as a recovery process for heavy oils.** Moore, R.G. (Univ. of Calgary, Alberta (Canada)); Laureshen, C.J.; Belgrave, J.D.M.; Ursenbach, M.G.; Jha, K.N. BDM Oklahoma, Inc., Bartlesville, OK (United States); National Inst. for Petroleum and Energy Research, Bartlesville, OK (United States). Feb 1995. (CONF-940450–: Field application in situ combustion practices: past, present and future applications, Tulsa, OK (United States), 21-22 Apr 1994). In *Field application of in situ combustion – past performance/future application: Proceedings.* 248p. Order Number DE95000130. Source: OSTI; NTIS; GPO Dep.

Lack of oil mobility is a major problem with in situ combustion field projects, since the combustion front displaces oil into an essentially unheated reservoir. One way of ensuring oil mobility is to utilize steam injection during the early life of the process, and then switch to combustion when heated communication paths have been developed. The in situ combustion characteristics of cores from the Primrose reservoir of Northeastern Alberta were investigated in a comprehensive series of 22 combustion tube tests. The program was carried out in order to evaluate the effectiveness of fireflooding in both cores that had been preheated to the extent that the oil was mobile and in those which were steam-flooded prior to dry combustion. Both normal- and 95% oxygen-enriched air were evaluated. Wet combustion tests were performed utilizing both liquid water and steam injection. The effects of parameters such as pressure, oxygen enrichment and injection flux on the combustion characteristics were examined. This paper will discuss the results of this study, which show that steam co-injection is more effective at lowering the oxygen requirement than was combustion following steam. Additionally, the cores which were preheated exhibited similar oxygen requirements to those which were presteamed to a near-residual saturation.

20639 (NIPER/BDM–0086, pp. 143-157) **The use of air injection to improve the double displacement processes.** Fassihi, M.R. (Amoco Production Co., Houston, TX (United States)); Gillham, T.H. BDM Oklahoma, Inc., Bartlesville, OK (United States); National Inst. for Petroleum and Energy Research, Bartlesville, OK (United States). Feb 1995. (CONF-940450–: Field application in situ combustion practices: past, present and future applications, Tulsa, OK (United States), 21-22 Apr 1994). In *Field application of in situ combustion – past performance/future application: Proceedings.* 248p. Order Number DE95000130. Source: OSTI; NTIS; GPO Dep.

The Double Displacement Process (DDP) has been defined as the gas displacement of a water invaded oil column. The purpose of injecting gas into a watered out oil reservoir is to recover more oil by creating a gas cap and thereby allowing gravity drainage of the liquids to occur. During 1994, Amoco Production Company, in partnership with the United States Department of Energy, will initiate the first project to combine air injection with the DDP. Due to the relatively low cost and potential for accelerated recovery, this unique IOR process may prove to be economically viable in low price environment. This report introduces the project by describing: (1) the initial project design, (2) core and fluid property tests, (3) details of the scoping reservoir models, (4) projected production performance and (5) safety considerations.

20640 (NIPER/BDM–0086, pp. 159-167) **Improved sweep efficiency through the application of horizontal well technology in a mature combustion EOR project: Battrum Field, Saskatchewan, Canada.** Ames, B.G. (Mobil Oil Canada, Alberta (Canada)); Grams, R.E.; Pebdani, F.N. BDM Oklahoma, Inc., Bartlesville, OK (United States); National Inst. for Petroleum and Energy Research, Bartlesville, OK (United States). Feb 1995. (CONF-940450–: Field application in situ combustion practices: past, present and future applications, Tulsa, OK (United States), 21-22 Apr 1994). In *Field application of in situ combustion – past performance/future application: Proceedings.* 248p. Order Number DE95000130. Source: OSTI; NTIS; GPO Dep.

In-situ combustion has been employed in the Battrum field since 1964. Although the field has responded favorably to combustion, efficiency of the horizontal displacement process appears to be poor in some areas of the field. Injected air and combustion gases accumulate at the top of the reservoir, and injected water moves into a zone of relatively high mobile water saturation, occurring at the base of the reservoir. Rapid breakthrough of the injected fluids increases operating costs due to high gas-oil ratios. Placement of horizontal wells below the combustion gas cap, and conversion to a vertical displacement process is expected to increase oil rate, improve oil recovery, and reduce operating costs.

20641 (NIPER/BDM–0086, pp. 169-177) **Shallow oil production using horizontal wells with enhanced oil recovery techniques.** Satchwell, R.M. (Western Research Institute, Laramie, WY (United States)); Johnson, L.A. Jr.; Trent, R. BDM Oklahoma, Inc., Bartlesville, OK (United States); National Inst. for Petroleum and Energy Research, Bartlesville, OK (United States). Feb 1995. (CONF-940450–: Field application in situ combustion practices: past, present and future applications, Tulsa, OK (United States), 21-22 Apr 1994). In *Field application of in situ combustion – past performance/future application: Proceedings.* 248p. Order Number DE95000130. Source: OSTI; NTIS; GPO Dep.

Millions of barrels of oil exist in the Bartlesville formation throughout Oklahoma, Kansas, and Missouri. In an attempt to demonstrate that these shallow heavy oil deposits can be recovered, a field project was undertaken to determine the effectiveness of enhanced oil recovery techniques (EOR) employing horizontal wells. Process screening results suggested that thermal EOR processes were best suited for the recovery of this heavy oil. Screening criteria suggested that in situ combustion was a viable technique for the production of these reserves. Laboratory combustion tube tests confirmed that sufficient amounts of fuel could be deposited. The results of the in situ combustion field pilot were disappointing. A total overall recovery efficiency of only 16.0 percent was achieved. Results suggest that the combustion front might have moved past the horizontal well, however elevated temperatures or crude upgrading were not observed. Factors contributing to the lack of production are also discussed.

20642 (NIPER/BDM–0086, pp. 179-201) **Naval Petroleum Reserve No. 3 (NPR-3), Teapot Dome Field, Wyoming: Case history of the in situ combustion pilot operation.** Sarathi, P.S.; Olsen, D.K.; Williams, C.R. BDM Oklahoma, Inc., Bartlesville, OK (United States); National Inst. for Petroleum and Energy Research, Bartlesville, OK (United States). Feb 1995. (CONF-940450–: Field application in situ combustion practices: past, present and future applications, Tulsa, OK (United States), 21-22 Apr 1994). In *Field application of in situ combustion – past performance/future application: Proceedings.* 248p. Order Number DE95000130. Source: OSTI; NTIS; GPO Dep.

Naval Petroleum Reserve No. 3 (NPR-3) is a federally owned oil field that has been in operation since 1922 and has produced more than 15 million barrels of oil since full production began in 1976. The Shannon sandstone is the shallowest and most productive of nine producing formations at NPR-3. Since only 5% of the Shannon's estimated 144 million bbl of original oil in place (OOIP) was estimated to be recoverable by primary means, studies were undertaken in 1978 to determine the most suitable enhanced oil recovery (EOR) method which would merit a pilot test and could ultimately lead to a fieldwide application.

20643 (NIPER/BDM–0086, pp. 203-206) **Enhanced oil recovery using hydrogen peroxide injection.** Moss, J.T. Jr.; Moss, J.T. BDM Oklahoma, Inc., Bartlesville, OK (United States); National Inst. for Petroleum and Energy Research, Bartlesville, OK (United States). Feb 1995. (CONF-940450–: Field application in situ combustion practices: past, present and future applications, Tulsa, OK

(United States), 21-22 Apr 1994). In *Field application of in situ combustion – past performance/future application: Proceedings.* 248p. Order Number DE95000130. Source: OSTI; NTIS; GPO Dep.

NOVATEC received an US Patent on a novel method to recovery viscous oil by hydrogen peroxide injection. The process appears to offer several significant improvements over existing thermal methods of oil recovery. Tejas joined NOVATEC to test the process in the laboratory and to develop oil field applications and procedures.

20644 (NIPER/BDM–0086, pp. 229-245) **Koch's experience with deep in situ combustion in Williston basin.** Miller, R.J. (Koch Exploration Co., Wichita, KS (United States)). BDM Oklahoma, Inc., Bartlesville, OK (United States); National Inst. for Petroleum and Energy Research, Bartlesville, OK (United States). Feb 1995. (CONF-940450–: Field application in situ combustion practices: past, present and future applications, Tulsa, OK (United States), 21-22 Apr 1994). In *Field application of in situ combustion – past performance/future application: Proceedings.* 248p. Order Number DE95000130. Source: OSTI; NTIS; GPO Dep.

Koch Exploration Company has been active with the combustion process in the Williston basin of North and South Dakota since 1979. Koch has three ongoing combustion projects in the basin. The Medicine Pole Hills Unit (MPHU) and the Capa Madison Unit (CMU) are located in the North Dakota, while the Buffalo Unit is situated in South Dakota. Because of low primary recovery from these deep carbonate reservoirs, studies were conducted to determine how the large volume of remaining oil could be recovered, and decisions were made to initiate an in situ combustion by air injection, pressure maintenance project in these reservoirs. The principal objective of this talk is to review the past performance of these combustion projects and discuss some of the operating problems we encountered. The other objectives are to outline the economics of the projects and to speculate on the future of in situ combustion technology as Koch sees it.

The U.S. Department of Energy's (DOE) Office of Gas and Petroleum Technology (OGPT) has been engaged in a strategic planning activity in response to the changing needs of the oil and gas industry and DOE's expanding role to address these needs. The Oil Processing sub-program is an important element of the OGPT program and is the topic of this paper. The major components of the Oil Processing Strategic Plan are described including the Mission, Situation Analysis, Vision of the Future, Strategic Goals, Strategic Barriers, and Objectives and Strategies.

20646 (CONF-941022–Vol.2, pp. 867-874) **Utilization of the spent caustics generated in the petroleum refineries in the crude distillation unit.** Sarkar, G.N. (Indian Oil Corporation Ltd., Vadodara (India)). USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

Generally 2 to 3 mg caustic per Litre of Crude Oil is used in the desalting Unit to take care of the acid generated from the Calcium and magnesium chlorides present in the crude Oil. Another 7-8 mg caustic is again added per litre of crude Oil to take care of the residual chlorides left over after desalting in the atmospheric distillation column. The spent caustics from the refineries contains a considerable amount of free sodium Hydroxide along with the pollutants like Sulphides, Phenolics and Mercaptides. The various distillation cuts contain considerable amount of Phenols, thioPhenols, Mercaptans etc. and can sustain with the finished streams from them with the stipulated specification. In the present work it is shown that the addition of this spent caustic in the crude oil will not only save the consumption of fresh caustic but will also solve the disposal problem which is major concern for pollution and at the same time will not deteriorate the products as well as equipments.

20647 (DOE/ER/13291–T1) **Interphase transport and multistage separations. Final report, September 1, 1984–August 31, 1994.** Stewart, W.E. Wisconsin Univ., Madison, WI (United States). Dept. of Chemical Engineering. 4 Aug 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-84ER13291. Order Number DE95011594. Source: OSTI; NTIS; GPO Dep.

This report gives a summary of the research accomplished under this project which included: Collocation analysis of multistage separation systems; Heat and mass transport fundamentals; Fractionation tray modeling; and Computational and statistical methods. The large equation sets encountered in tray-by-tray modeling of distillation systems are a major obstacle in computer-aided process engineering. The authors addressed this difficulty by approximating the multistage equations with much smaller sets, obtained by orthogonal polynomial interpolation over the stages. A new approach to column design was initiated when they discovered how to extend their collocation formulas to modules containing non-integer numbers of stages. This extension proved equally useful for column simulations in the presence of more than one liquid phase. They also investigated strategies to handle locally steep concentration profiles and high-purity separations. As a basis for realistic modeling of fractionating trays, a comprehensive comparison of various computation methods for multicomponent mass transfer was undertaken. A theoretical study was carried out for asymptotic forms for heat and mass transfer rates in boundary layers. Newton's method was used in several of the computational algorithms for equation solving, parametric sensitivity analysis and nonlinear parameter estimation. The authors investigated modifications of the Newton method designed to achieve convergence over a wider range of initial guesses. Other computer codes have been enhanced as a result of this project.

Produced water generated during the production of oil and gas can contain high concentrations of radionuclides, organics and heavy metals. There are concerns about potential human health and ecological impacts from the discharge of these contaminants to the Gulf of Mexico. Data collected in the United States Department of Energy (USDOE) field study are being used in a series of human health and ecological risk assessments. These assessments will support scientifically-based regulation and risk management. This presentation: summarizes risk assessments performed for produced water discharges; describes how uncertainties in these assessments are guiding data collection efforts in the USDOE field study; and outlines ongoing risk assessment studies. In these studies, risk assessment is treated as an iterative process. An initial screening-level assessment is performed to identify important contaminants, transport and exposure pathways, and parameters. These intermediate results are used to guide data collection efforts and refinements to the analysis. At this stage in the analysis, risk is described in terms of probabilities; the uncertainties in each measured or modeled parameter are considered explicitly.

20649 (DOE/EIA–0109(95/02)) **Petroleum supply monthly, February 1995, with data for December 1994.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. 27 Feb 1995. 160p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95007674. Source: OSTI; NTIS; GPO; GPO Dep.

Data presented in the Petroleum Supply Monthly (PSM) describe the supply and disposition of petroleum products in the US and major US geographic regions. The data series describe production, imports and exports, inter-Petroleum Administration for Defense (PAD) District movements, and inventories by the primary suppliers of petroleum products in the US (50 States and the District of Columbia). The reporting universe includes those petroleum sectors in primary supply. Included are: petroleum refiners, motor gasoline blenders, operators of natural gas processing plants and fractionators, inter-PAD transporters, importers, and major inventory holders of petroleum products and crude oil. Data presented in the PSM are divided into two sections: Summary Statistics and Detailed Statistics. The tables and figures in the Summary Statistics section of the PSM present a time series of selected petroleum data on a US level. The detailed Statistics tables of the PSM present statistics for the most current month available as well as year-to-date. In most cases, the statistics are presented for several geographic areas–the US (50 States and the District of Columbia), five PAD Districts, and 12 Refining Districts. 16 figs., 66 tabs.

The Petroleum Supply Monthly (PSM) is one of a family of four publications produced by the Petroleum Supply Division within the Energy Information Administration (EIA) reflecting different levels of data timeliness and completeness. The other publications are the Weekly Petroleum Status Report (WPSR), the Winter Fuels Report, and the Petroleum Supply Annual (PSA). Data presented in the PSM describe the supply and disposition of petroleum products in the United States and major US geographic regions. The data series describe production, imports and exports, inter-Petroleum Administration for Defense (PAD) District movements, and inventories by the primary suppliers of petroleum products in the United States (50 States and the District of Columbia). The reporting universe includes those petroleum sectors in primary supply. Included are: petroleum refiners, motor gasoline blenders, operators of natural gas processing plants and fractionators, inter-PAD transporters, importers, and major inventory holders of petroleum products and crude oil. When aggregated, the data reported by these sectors approximately represent the consumption of petroleum products in the United States.Data presented in the PSM are divided into two sections: Summary Statistics and Detailed Statistics.

20651 (DOE/EIA–0340(94)/1) **Petroleum supply annual 1994. Volume 1.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. 22 May 1995. 190p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012803. Source: OSTI; NTIS; GPO; INIS; GPO Dep.

The Petroleum Supply Annual (PSA) contains information on the supply and disposition of crude oil and petroleum products. The publication reflects data that were collected from the petroleum industry during 1994 through annual and monthly surveys. The PSA is divided into two volumes. This first volume contains four sections: Summary Statistics, Detailed Statistics, Refinery Capacity, and Oxygenate Capacity each with final annual data. The second volume contains final statistics for each month of 1994, and replaces data previously published in the Petroleum Supply Monthly (PSM). The tables in Volumes 1 and 2 are similarly numbered to facilitate comparison between them. Below is a description of each section in Volume 1 of the PSA.

20652 (DOE/EIA–0340(94)2) **Petroleum supply annual 1994, Volume 2.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. Jun 1995. 599p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95013380. Source: OSTI; NTIS; INIS; GPO; GPO Dep.

The Petroleum Supply Annual (PSA) contains information on the supply and disposition of crude oil and petroleum products. The publication reflects data that were collected from the petroleum industry during 1994 through annual and monthly surveys. The PSA is divided into two volumes. This first volume contains four sections: Summary Statistics, Detailed Statistics, Refinery Capacity, and Oxygenate Capacity each with final annual data. The second volume contains final statistics for each month of 1994, and replaces data previously published in the Petroleum Supply Monthly (PSM). The tables in Volumes 1 and 2 are similarly numbered to facilitate comparison between them. Explanatory Notes, located at the end of this publication, present information describing data collection, sources, estimation methodology, data quality control procedures, modifications to reporting requirements and interpretation of tables. Industry terminology and product definitions are listed alphabetically in the Glossary.

20653 (DOE/EIA–0380(95/05)) **Petroleum marketing monthly, May 1995 with data for February 1995.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. 9 May 1995. 212p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95011870. Source: OSTI; NTIS; GPO; GPO Dep.

The Petroleum Marketing Monthly (PMM) provides information and statistical data on a variety of crude oils and refined petroleum products. The publication presents statistics on crude oil costs and refined petroleum products sales for use by industry, government, private sector analysts, educational institutions, and consumers. Data on crude oil include the domestic first purchase price, the f.o.b. and landed cost of imported crude oil, and the refiners' acquisition cost of crude oil. Refined petroleum product sales data include motor gasoline, distillates, residuals, aviation fuels, kerosene, and propane. The Petroleum Marketing Division, Office of Oil and Gas, Energy Information Administration ensures the accuracy, quality, and confidentiality of the published data in the Petroleum Marketing Monthly.

20654 (DOE/EIA–0520(95/05)) **International petroleum statistics report, May 1995.** USDOE Energy Information Administration, Washington, DC (United States). Office of Energy Markets and End Use. 30 May 1995. 79p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012806. Source: OSTI; NTIS; GPO; GPO Dep.

The International Petroleum Statistics Report presents data on international oil production, demand, imports, exports, and stocks. The report has four sections. Section 1 contains time series data on world oil production, and on oil demand and stocks in the Organization for Economic Cooperation and Development (OECD). This section contains annual data beginning in 1985, and monthly data for the most recent two years. Section 2 presents an oil supply/demand balance for the world. This balance is presented in quarterly intervals for the most recent two years. Section 3 presents data on oil imports by OECD countries. This section contains annual data for the most recent year, quarterly data for the most recent two quarters, and monthly data for the most recent twelve months. Section 4 presents annual time series data on world oil production and oil stocks, demand, and trade in OECD countries. World oil production and OECD demand data are for the years 1970 through 1994; OECD stocks from 1973 through 1994; and OECD trade from 1983 through 1993.

20655 (DOE/EP/10050–T5) **Recent hydrocarbon developments in Latin America: Key issues in the downstream oil sector.** Energy investment advisory series: No. 4. Wu, K.; Pezeshki, S. East-West Center, Honolulu, HI (United States). Mar 1995. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-93EP10050. Order Number DE95011465. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the following: (1) An overview of major issues in the downstream oil sector, including oil demand and product export availability, the changing product consumption pattern,

and refineries being due for major investment; (2) Recent upstream developments in the oil and gas sector in Argentina, Bolivia, Brazil, Chile, Colombia, Ecuador, Mexico, Peru, Trinidad and Tobago, and Venezuela; (3) Recent downstream developments in the oil and gas sector in Argentina, Chile, Colombia, Ecuador, Mexico, Peru, Cuba, and Venezuela; (4) Pipelines in Argentina, Bolivia, Brazil, Chile, and Mexico; and (5) Regional energy balance. 4 figs., 5 tabs.

20656 (DOE/IG–0370) **Audit of staffing requirements for the Strategic Petroleum Reserve.** USDOE Office of Inspector General, Washington, DC (United States). 29 Mar 1995. 59p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI (Free of Charge).

Report to The Secretary.

The Department of Energy's (Department) Strategic Petroleum Reserve (Reserve) is responsible for storing large quantities of crude oil, currently about 592 million barrels, to reduce the impact of any future supply disruptions. The Reserve facilities consist of a marine terminal and five underground storage sites located in Louisiana and Texas, and program and administrative offices in New Orleans and Washington, DC. At May 31, 1994, 1,692 Departmental and contractor personnel were employed in the operation, maintenance, and administration of Reserve activities and the Fiscal Year 1994 Congressional Appropriation was about $207 million. The audit was requested by the Deputy Secretary of Energy to assist Departmental management in evaluating the human resources required to meet Reserve program requirements. Specifically, the objective of the audit was to determine whether current staffing levels for the Reserve were necessary to effectively and efficiently accomplish current and future anticipated mission requirements. The Secretary's goal of having the Department and its contractors embrace the best management practices in other Government agencies and industry to improve processes and eliminate waste has not been fully realized by Reserve management. We identified industry performance levels and staffing practices that, if achieved by the Reserve, could enable the Reserve to eliminate approximately 329 positions in eight functional areas with potential annual savings of about $16 million. Our analysis indicated that additional staffing reductions are possible over the long term through further application of industry practices and decreases in the number of managers. However, such staffing reductions will require further analysis by management to determine the specific number of staffing reductions that are attainable. The actual staffing reductions realized by the Reserve will be heavily influenced by several factors.

0209 Environmental Aspects

20657 (ANL/EAD/TM–43) **Potential environmental benefits from regulatory consideration of synthetic drilling muds.** Burke, C.J. (Argonne National Lab., IL (United States). Environmental Assessment Div.); Veil, J.A. Argonne National Lab., IL (United States). Feb 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95011787. Source: OSTI; NTIS; INIS; GPO Dep.

When drilling exploration and production wells for oil and gas, drillers use specialized drilling fluids, referred to as muds, to help maintain well control and to remove drill cuttings from the hole. Historically, either water-based muds (WBMs) or oil-based muds (OBMs) have been used for offshore wells. Recently, in response to US Environmental Protection Agency (EPA) regulations and drilling-waste discharge requirements imposed by North Sea nations, the drilling industry has developed several types of synthetic-based muds (SBMs) that combine the desirable operating qualities of OBMs with the lower toxicity and environmental impact qualities of WBMs. This report describes the operational, environmental, and economic features of all three types of muds and discusses potential EPA regulatory barriers to wider use of SBMs.

20658 (DOE/MT/94003–3) **Assistance to the states with risk based data management. Quarterly technical progress report, January 1, 1995–March 31, 1995.** Underground Injection Practices Research Foundation, Oklahoma City, OK (United States). [1995]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-94MT94003. Order Number DE95012187. Source: OSTI; NTIS; GPO Dep.

This report describes activities associated with the risk based data management systems (RBDMS) project. The RBDMS applies to data pertaining to injection well operations. This report describes assistance provided to the states of ALaska, Mississippi, Montana, and Nebraska for the conversion of data from existing data management systems, coding and internal testing of the RBDMS, document preparation, training, technology transfer, and project management.

20659 (DOE/MT/95006–1) **Environmental Assessment of Oklahoma abandoned drilling and production sites and associated public education/outreach activities. Quarterly technical progress report, February 8, 1995–March 30, 1995. First quarter of 1995.** Terry, M. Oklahoma Energy Resources Board, Oklahoma City, OK (United States). 27 Apr 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-95MT95006. Order Number DE95012443. Source: OSTI; NTIS; GPO Dep.

The purpose of this project was to conduct environmental assessments of abandoned oil and gas drilling sites where no responsible owner can be found and transfer environmental technology to oil and gas operators; and provide a comprehensive public education program concerned with the oil and gas industries.

20660 (PNL-SA–24717) **Enhancing in situ bioremediation with pneumatic fracturing.** Anderson, D.B.; Peyton, B.M.; Liskowitz, J.L.; Fitzgerald, C.; Schuring, J.R. Pacific Northwest Lab., Richland, WA (United States). Apr 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9404265–1: 3. international symposium in situ and on-site bioreclamation, San Diego, CA (United States), 24-27 Apr 1994). Order Number DE95012394. Source: OSTI; NTIS; INIS; GPO Dep.

A major technical obstacle affecting the application of in situ bioremediation is the effective distribution of nutrients to the subsurface media. Pneumatic fracturing can increase the permeability of subsurface formations through the injection of high pressure air to create horizontal fracture planes, thus enhancing macro-scale mass-transfer processes. Pneumatic fracturing technology was demonstrated at two field sites at Tinker Air Force Base, Oklahoma City, Oklahoma. Tests were performed to increase the permeability for more effective bioventing, and evaluated the potential to increase permeability and recovery of free product in low permeability soils consisting of fine grain silts, clays, and sedimentary rock. Pneumatic fracturing significantly improved formation permeability by enhancing secondary permeability and by promoting removal of excess soil moisture from the unsaturated zone. Post-fracture airflows were 500% to 1,700% higher than prefracture airflows for specific fractured intervals in the formation. This corresponds to an average prefracturing permeability of 0.017 Darcy, increasing to an average of 0.32 Darcy after fracturing. Pneumatic fracturing also increased free-product recovery rates of number 2 fuel from an average of 587 L (155 gal) per month before fracturing to 1,647 L (435 gal) per month after fracturing.

0210 Legislation and Regulations

20661 (ANL/EA/RP–86431) **Analysis of EPA's cost-effectiveness study for the coastal oil and gas effluent limitations guidelines.** Veil, J. Argonne National Lab., IL (United States). May 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95011823. Source: OSTI; NTIS; GPO Dep.

The US Environmental Protection Agency (EPA) conducted a cost-effectiveness (CE) analysis to estimate the incremental cost of complying with the proposed effluent limitation guidelines (ELGs) for the coastal oil and gas industry (EPA 1995a). EPA's CE analysis calculates the pounds of each pollutant that would be removed if the chosen discharge option is selected. In 1993, EPA issued final ELGs for the offshore oil and gas industry and published an

offshore CE analysis. The chemical characteristics of produced water from the offshore region are essentially the same as those of produced water from the coastal region. It was surprising, therefore, that EPA chose a much longer list of pollutants and generally stricter weighting factors for the coastal CE analysis. This report reviews the data, assumptions, and analyses used in EPA's coastal CE analysis and identifies alternate data, assumptions, and analyses that could lead to significantly different cost-effectiveness conclusions. Two alternate lists of pollutants are proposed, along with recalculated weighting factors for several pollutants that contributed a large proportion of the total PEs removed–radium, benzo(a)pyrene, boron, and ammonia. By using different combinations of these variables, a range of revised estimates of CE is calculated.

20662 (ANL/ESD/TM–86) **Development of an analytical model for organic-fluid fouling.** Panchal, C.B.; Watkinson, A.P. Argonne National Lab., IL (United States). Oct 1994. 127p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95013278. Source: OSTI; NTIS; GPO Dep.

The research goal of this project is to determine ways to effectively mitigate fouling in organic fluids: hydrocarbons and derived fluids. The fouling research focuses on the development of methodology for determining threshold conditions for fouling. Initially, fluid containing chemicals known to produce foulant is analyzed; subsequently, fouling of industrial fluids is investigated. The fouling model developed for determining the effects of physical parameters is the subject of this report. The fouling model is developed on the premise that the chemical reaction for generation of precursor can take place in the bulk fluid, in the thermal-boundary layer, or at the fluid/wall interface, depending upon the interactive effects of fluid dynamics, heat and mass transfer, and the controlling chemical reaction. In the analysis, the experimental data are examined for fouling deposition of polyperoxide produced by autoxidation of indene in kerosene. The effects of fluid and wall temperatures for two flow geometries are analyzed. The results show that the relative effects of physical parameters on the fouling rate differ for the three fouling mechanisms. Therefore, to apply the closed-flow-loop data to industrial conditions, the controlling mechanism must be identified.

20663 (CONF-941022–Vol.2, pp. 433-447) **Thickness measurement of JFTOT tube deposits by ellipsometry.** Baker, C. (BP Oil, Sunbury-on-Thames (United Kingdom)); David, P.; Taylor, S.E.; Woodward, A.J. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

Thickness measurement of Jet Fuel Thermal Oxidation Test (JFTOT) tube deposits has long been a desirable goal to characterize better the thermal stability of jet fuels. The current visual rating method used for specification purposes suffers from the drawback of operator subjectivity and provides little information on the thickness and volume of deposits, parameters which are far more meaningful for characterizing fuels for users and suppliers. Ellipsometry has been identified as a suitable technique for measuring the thickness of JFTOT tubes. Such a system would be robust and non-destructive; cover the important thickness range with regard to visual ratings; provide quick and easy absolute measurement of thickness; enable single spot and profiling measurements; and there would be no restriction on minimum deposit thickness.

20664 (CONF-941022–Vol.2, pp. 449-461) **Weighing by stopwatch - sorting out the variables in filter blocking tendency.** Hardy, D.R. (Naval Research Lab., Washington, DC (United States)); Beal, E.J.; Hughes, J.M. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

This paper first reviews the work reported in the early 1960's on the major variable governing rate of flow of a liquid through a membrane filter - viscosity. Ignoring this major variable leads to both confusing interpretation of filter blocking tendency (FBT) experiments in the laboratory and also for FBT standard tests which cannot adequately or correctly assess FBT from fuel to fuel. Next, the paper will establish a protocol for correctly assessing any given liquid FBT by first calibrating given porosity membrane filters for viscosity and then for solids content. The technique can then be used to measure not only existent solids in various liquid samples but also solids formed during typical accelerated tests such as the gravimetric JFTOT test (for aviation fuels) or ASTM D5304 (for diesel fuels) using only a stopwatch and graduated cylinder. Accuracy and precision of this "weighing" technique will be compared with direct gravimetric determinations.

20665 (CONF-941022–Vol.2, pp. 463-477) **Monitoring the formation of soluble deposit precursors in fuels with light scattering photometry.** Morris, R.E. (Naval Research Lab., Washington, DC (United States)); Hardy, D.R.; Pande, S.; Wechter, M.A. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

The reactions that can take place in hydrocarbon fuels often manifest themselves as an increase in the propensity to form thermally induced soluble reaction products. This is not a one-step process but the result of a multitude of intermediate processes. These intermediate processes will produce a range of soluble products that differ considerably in structure and functionality from the fuel itself. Since these soluble "precursors" can, upon further thermal stress, lead to insoluble products, a method for following their formation could form the basis of a useful predictive measurement. It would also serve as a research tool for following the discrimination between soluble and insoluble product formation. Light scattering photometry was evaluated as a means of monitoring the formation of large soluble product molecules as they are formed in fuels. Changes in light scattering properties were measured after thermal stressing in the presence of dissolved copper and a metal deactivator additive. These results correlated well with the amounts of soluble and insoluble products formed. Fuel changes were detected by light scattering before detectable quantities of insoluble products were produced.

20666 (CONF-941022–Vol.2, pp. 479-493) **An improved reference fuel system: Part 2 - A study of adherent and filterable insolubles formation as functions of trimethylpyrrole concentration in dodecane.** White, E.W. (Naval Surface Warfare Center, Annapolis, MD (United States)); Klinkhammer, M.D. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

At the 4th International Conference on the Stability and Handling of Liquid Fuels, a trimethylpyrrole (TMP)/dodecane reference fuel system for use with ASTM Test Method D2274 was presented. It was concluded that the TMP/dodecane system would have sufficient reproducibility of total insolubles values to serve as a reference fuel system. In this paper, the filterable and adherent insolubles from the same data base are examined. Like the total

insolubles, the FY 91 results for both adherent and filterable were less scattered than the FY 90 data. Both adherent and filterable insolubles were found to be adequately and filterable insolubles were found to be adequately represented as linear functions of the initial TMP concentration. Further, the data support a hypothesis that filterable insolubles do not form in the 16 hours of stress unless the initial TMP concentration is greater than about 25 mg/100 mL. A plot of the FY 91 ratio of adherent insolubles to filterable insolubles as a function of the initial TMP concentration approaches 0.6 at TMP concentrations in excess of 75 mg/100 mL.

20667 (CONF-941022–Vol.2, pp. 495-511) **Revised procedure for the measurement of particulate matter in Naval JP5 aviation turbine fuel (F44; AVCAT) using the contaminated fuel detector (CFD).** McVea, G.G. (Aeronautical and Maritime Research Lab., Victoria (Australia)); Power, A.J. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

USA Military Specification MIL-D-22612 provides a procedure for measurement of particulate levels in Naval aviation gas turbine engine JP5 fuel (F44; RAN AVCAT) using the contaminated fuel detector (CFD). Evaluation of this procedure within the specification has revealed significant shortcomings in the application of the theoretical principles upon which the method is based. CFD measurements have been compared to gravimetric results from ASTM D2276, which provides accurate determination of concentrations of particulate matter in JP5. Inaccuracies evident in the CFD readings have been found to relate to the high sensitivity of the CFD to variations in fuel particulate extinction coefficients (ECs) (relating to fuel sediment colour) and to an error in the application of light transmittance theory in the recommended method. This report demonstrates that accurate CFD determination of JP5 particulate concentrations depends on spectrophotometric measurement of a narrow range of ECs of particulate matter. A range of fuel sediments derived from Australian naval ship and shore fuel storages was studied. It was observed that the CFD plot, which is in light transmittance mode, in theory provides a curved line graph against the gravimetric test results, whereas MIL-D-22612 describes a straight line graph. It was concluded that this must be an approximation. However, conversion of light transmittance data derived from the CFD into the reciprocal logarithm to give light absorbance data was shown to give a straight line graph which corresponded well with the gravimetric results. This relationship depended on construction of the graph on the basis of a narrow range of known particulate ECs. The conversion to absorbance gave improved correlation for JP5 particulate measurements with gravimetric procedures, using the CFD.

20668 (CONF-941022–Vol.2, pp. 513-523) **Effect of metal oxides and tanks' deposits on the oxidative stability of gasoline.** Ivanov, S.K. (SciBulCom, Ltd., Sofia (Bulgaria)); Kalitchin, Z.D.; Georgiev, P.T.; Boneva, M.I.; Tanielyan, S.K. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

The present investigation is devoted to assessment of the influence of species isolated from fuel tanks and tank bottoms on the oxidative stability of gasoline. The aim of the paper is to be evaluated quantitatively the effect of rust and tank deposits on the oxidation processes and the storage terms of motor gasoline containing catalytic cracking fraction on the basis of a method developed by us earlier. As a result of the theoretical model and the experiments is found that the deposits decrease the chemical stability of gasoline containing 50% fraction from catalytic cracking, while the rust has no significant influence on this parameter. Correction coefficients are calculated and introduced, taking into account the influence of deposits and rust on the predicted storage terms.

20669 (CONF-941022–Vol.2, pp. 525-539) **Improving storage stability of gasoline using elevated antioxidant concentrations.** Sommer, S. (Israel Fuel Corp. LTD, Tel Aviv (Israel)); Luria, D.; Lavie, I.; Sufrin, J.; Weiss, A.; Shuftan, M. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

The purpose of this study was to examine the feasibility of increasing storage-stability of gasoline by blending it with elevated concentrations of standard antioxidants, normally added at low concentrations to gasolines. It was thought that, by raising the concentration of these additives in the gasoline from 25 ppm to 100 ppm, the storage stability of the fuel can be improved. In this study, two types of antioxidants (an aromatic diamine type and an alkylphenol type), and a mixture of the two, were added at different concentrations to two different gasoline blends. The various blends were stored in drums, simulating tank storage conditions, for a period of 25 months. Samples were drawn at varying intervals over the test duration and tested for Existent Gum, Potential Gum, Induction Period and other properties (according to standard ASTM test procedures). It was found that raising the concentrations of the aromatic amine antioxidant adversely effected the storage stability of the gasoline blends, whereas elevated concentrations of the alkylphenol antioxidant indeed improved the gasoline's stability.

20670 (CONF-941022–Vol.2, pp. 541-551) **The effect of some metals on the oxidative and storage stability of gasoline.** Kalitchin, Z.D. (SciBulCom, Ltd., Sofia (Bulgaria)); Ivanov, S.K.; Georgiev, P.T.; Boneva, M.I.; Tanielyan, K. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

The catalytic action of transitional metal compounds on the oxidation of organic substrates with atmospheric oxygen has received considerable attention in the literature. The efFect of metal surface (Fe and Zn) on the oxidation processes and storage terms of motor gasoline containing fraction from catalytic cracking have been investigated. Both metals are chosen because they are the main construction material of the fuel tanks. On the basis of the kinetic data the correction coefficient k_m evaluating the influence of metals on the oxidation processes of gasoline has been determined. This correction coefficient is included in the calculation for prediction of the real storage terms of gasoline.

20671 (CONF-941022–Vol.2, pp. 553-570) **Gum formation tendencies of olefinic structures in gasoline and synergistic effect of sulphur compounds.** Nagpal, J.M. (Indian Institute of Petroleum, Dehradun (India)); Joshi, G.C.; Aswal, D.S. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

The high octane gasoline pool contains varying amounts of cracked naphthas as an important ingredient in formulating high octane lead free gasoline. The cracked naphthas are largely from Fluidized Catalytic Cracking (FCC) units and to lesser extend from thermal cracking units. While the role of olefinic unsaturation in gum formation during storage of gasoline has been extensively studied, there is little published work on contribution of individual olefin types in storage stability and gum formation tendency of gasoline containing these compound types. In the present work we report our results on storage stability and gum formation tendency of different olefin types present in cracked naphthas through model compound matrix. It is found that cyclic olefins and cyclic diolefins are the most prolific gum formers. We have also studied the role of

sulfur compounds present in the gasolines on gum formation tendency of olefins. While thiols enhance gum formation from all olefinic types, sulfides and disulfides interact depending on the structure of olefins. These can have either an accelerating, or inhibiting effect on gum formation.

20672 (CONF-941022–Vol.2, pp. 571-582) **Intercompatibility of residual fuel blends.** Ben-Asher, J. (Israel Institute of Petroleum and Energy, Tel Aviv (Israel)); Krenis, G.; Luria, D. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

It is a well known fact that two fuel oils, thermally stable by themselves, may produce sludge of asphaltenic nature when blended together. Settling out of asphaltenes from the fuel medium will result in strainer and burner plugging, causing serious operational difficulties in industrial and marine fuel systems. It was the aim of the present study to establish criteria for the phenomenon of incompatibility. The parameters which influence thermal stability of the blend were assessed, and an attempt was made to predict possible separation of asphaltenes from fuel oil mixtures. Fuel oils originating from Brazil, France, Hong-Kong, Greece, U.S.A., Japan as well as locally (Israel) produced residual fuels were mixed. Thermal stability of the blend was determined by ASTM D-4740 method. In some cases, total sediment was measured by ASTM D-4870. Blends of fuels were stored at 50°C to assess the effect of elevated temperatures on thermal stability. It was found that most of the blends were compatible though composed of fuels originating from different refineries. Density, Pour Point, Sulfur content and Xylene Number served as useful tools for predicting the thermal stability of residual fuel blends.

20673 (CONF-941022–Vol.2, pp. 583-592) **Compatibility and stability of residual fuels.** Kassinger, R. (DNV Petroleum Services, Teaneck, NJ (United States)). USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

The stability and compatibility of residual fuels are discussed. A stable fuel is one which contains minimum amount of sediment when produced. On storage sediment level and other properties, such as viscosity do not change significantly over time. Sediment level is currently most widely measured by the IP 375 and/or IP 390 Sediment Test. Stable fuels have sediment levels of $\leq$ 0.1% wt. This test is actually a measure of fuel cleanliness. Compatibility refers to the condition of a blend of two fuel components. Two fuels, each with low sediment content are compatible if the sediment of the resultant blend is low. If on the other hand the sediment level of the blend is significantly higher than the individual components, ($>>$ 0.1%) the fuels are incompatible. The blended fuel itself would be described as unstable. Residual fuels are extremely complex products both physically and chemically. The most widely held view of composition is one in which very large asphaltene molecules are colloidally dispersed in an oil phase (maltenes). The asphaltene molecules have a tendency to agglomerate, and this propensity is a function of the oil phase composition. In stable fuels the oil phase prevents the asphaltene micelles from agglomerating and precipitating as sludge. This is related to the oil phase aromaticity and solvency. In order to be stable the oil continuous phase of a fuel must have a minimum level of aromaticity to keep the asphaltenes in suspension. The asphaltenes themselves vary in the amount of aromaticity is required to prevent their agglomeration. This requirement is related to the origin of the asphaltenes. It is well documented that asphaltenes in thermally cracked or visbroken residues have a higher aromaticity requirement than the asphaltenes from a straight run residue. It was known as far back as 1938 that diluents such as cat cracked gas oil, are excellent cutter stocks for the production of "stable" residual fuels.

20674 (CONF-941022–Vol.2, pp. 609-623) **Mechanisms for ageing of middle distillates manufactured from crude oils.** Derst, P. (Committee Product Application-Fuels, Hamburg (Germany)). USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

European middle distillate marketers and manufacturers have recently seen a surprising increase of ageing phenomena, mainly in the new eastern provinces of Germany after installation of new home heating oil units. Some of these phenomena remain unexplained, so that the "Committee Product Application-Fuels" of the DGMK (German Society for Petroleum and Coal Science and Technology) agreed to foster a research study with respect to ageing of middle distillates manufactured from mineral oils. As step I a literature search was authorized, as it was felt that since over 50 years of work had been done on the subject without culminating in an overall deterioration and degradation theory yet. What has been found by the search is a majority of papers dealing with the results of ageing processes taken from real life cases and trying to resimulate them in the laboratory while reducing the reaction time. Relatively few papers try to explain chemical/physical reaction mechanisms on which an ageing theory could be built. An obvious problem with testing distillates and presented by many papers is the isolation of a blend component often found harmful for a finished product, from the rest of the fuel components, thus omitting preventative forces or activating/accelerating agents from the findings. Many tests with Light Cat Cycle Oil (LCO) are typical examples. This isolation can explain the many contradictive findings in literature, which this paper will document in detail. The most promising theory requires a set of conditions/chemicals to be met/present to kick off the ageing process and progress it until one of the components is consumed. The paper will provide details on these "danger chemicals" found in literature. Finally the most promising reaction kinetic models found in the literature will be critically reviewed.

20675 (CONF-941022–Vol.2, pp. 625-648) **Evaluation of commercial stability additives in middle distillate fuels.** Waynick, J.A. (Amoco Oil Co., Naperville, IL (United States)). USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

Ten commercial distillate stability additives were evaluated to determine their effect on the stability and chemistry of two distillate fuels. The two fuels were light catalytic cycle oil (LOCO) and a diesel fuel blend containing 15% of the same LOCO. Additives were evaluated for their ability to improve stability as measured by three test procedures. Also, their effect on fuel composition was measured. All additives were essentially sulfur-free nitrogen-containing compounds. Most of the nitrogen in each additive was basic nitrogen. Additive effectiveness did not correlate with total or basic nitrogen content. Additives that were blends of stabilizer, dispersant, and metal deactivator did not show a clear performance improvement when compared to additives of a simpler composition. The most cost-effective additive in improving stability was N,N-dimethylcyclohexylamine, with only one other additive giving comparable performance. One additive decreased stability. All additives were found to inhibit the formation of SMORS, species reputed to be sediment precursors. Also, all additives promoted increased levels of phenalenones that were formed in aged LCCO. The effect on SMORS and phenalenones are consistent with current theories of distillate instability chemistry.

20676 (CONF-941022–Vol.2, pp. 649-665) **The effect of aliphatic olefins on the stability of diesel fuel.** Adiwar (PPPT-MGB LEMIGAS, Jakarta (Indonesia)); Batts, B.D. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United

States). Office of Technical Management. Apr 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

The effect of aliphatic olefins on the storage stability of a number of distillates was observed and characterized, mainly by determining the amounts of total insolubles formed during accelerated ageing. It was observed that the aliphatic olefins, in light cycle oil (LCO), a product of catalytic cracking, accelerated the degradation process in accordance with general expectations and in straight run diesel (SRD) and hydrotreated diesel (HTD), aliphatic olefins were shown to have no effect on stability. However, contrary to expectations, the aliphatic olefins inhibited the degradation process of light waxy gas oil (LWGO). The effect of aliphatic isomers on the degradation of LCO is in the order of terminal olefins < internal olefins < branched chain olefins. The effect of aliphatic olefinic isomers on LWGO is, on the other hand, in the order of terminal olefin > internal olefins > branched chain olefins. Three possible mechanisms to explain the effect of aliphatic olefins on the LCO and LWGO samples are proposed.

20677 (CONF-941022–Vol.2, pp. 667-681) **Chemistry of sediment formation and additive response in cracked middle distillates.** Sharma, Y.K. (Indian Institute of Petroleum, Dehradun (India)); Singh, I.D.; Agrawal, K.M.; Saxena, G.C. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

The current trend in middle distillate maximization is to blend significant proportions of cracked stocks. This blending enhances instability of the product which creates application problems. In order to reduce/prevent sediment formation it is essential to understand the chemistry of sediment formation. Further knowledge of sediment precursors in cracked middle distillates facilitates in screening of the suitable additives and in studying their response in prevention of sediment formation. The present paper discusses the characterization of sediment precursors, separated through methanol extraction, employing derivatization technique and FTIR spectroscopy. The effect of few commercial additives on the stability of cracked fuels both under accelerated conditions and ambient storage have also been studied. The study indicated that performance of an additive in cracked middle distillate fuels depends on fuel composition, additive structure and fuel storage conditions. From the comparison of FTIR spectra, it has been concluded that methanol extracts the sediment precursors.

20678 (CONF-941022–Vol.2, pp. 683-696) **A study of the safety of the ASTM D5304 oxygen overpressure stability test.** White, E.W. (Naval Surface Warfare Center, Annapolis, MD (United States)); Flohr, K.W. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

While the test method for assessing distillate fuel storage stability by oxygen overpressure was being evaluated as a potential ASTM standard, a question of its safety was raised, specifically whether the juxta-position of liquid fuel and oxygen at elevated pressure could lead to explosive self ignition. As a consequence, the authors conducted a literature search followed by a small experimental program. The results of those studies show that the temperature and pressure used in Test Method D5304 are probably safely below the conditions that would lead to autoignition of normal middle distillate fuels. However, middle distillate fuels of unknown or unusual sources, or containing additives, e.g. ignition improvers, should be screened before evaluating their stability by Test Method D5304.

20679 (CONF-941022–Vol.2, pp. 697-723) **A comparison of low and high sulfur middle distillate fuels in the United States.** Waynick, J.A. (Amoco Oil Co., Naperville, IL (United States)); Taskila, S.M. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

Sixty-nine low sulfur (LS) and twenty-six high sulfur (HS) No. 2 diesel fuel samples were collected from twenty-four marketers throughout the United States in early 1994. Fuel samples were tested for chemical composition, physical properties, and stability. All data was statistically analyzed, and a multi-variable regression analysis was performed to determine predictive equations for stability and cold flow test results. The statistical analysis indicated that other than sulfur and nitrogen levels, the main compositional difference between LS and HS diesel fuels was a partial saturation of poly-aromatics to mono-aromatics in LS fuel. Storage stability via ASTM D4625 was improved in LS fuels compared to HS fuels, and poly-aromatics were identified as important contributors to insolubles formation. Hydroperoxide susceptibility of LS and HS fuels was equivalent and acceptable under conditions of ambient fuel transport and storage. However, under progressively severe thermal and oxidative stress, LS fuels appeared increasingly less stable than HS fuels. Under the most stressful conditions used, average hydroperoxide formation rates for LS and HS fuels had regression equations that differed only by a constant factor. Compositional variables that contributed to secondary and benzylic carbons were found to strongly increase hydroperoxide formation. Examination of the test data also indicated that LS diesel fuels might be less responsive to cold flow improvers than HS diesel fuels.

20680 (CONF-941022–Vol.2, pp. 725-742) **Characterization of Soluble Macromolecular Oxidatively Reactive Species (SMORS) from middle distillate diesel fuels: Their origin and role in instability.** Wechter, M.A. (Univ. of Massachusetts, Dartmouth, MA (United States)); Hardy, D.R. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

Compositional characterization of a solid phase material isolated by extraction from filtered liquid phase diesel fuels is reported. This solid phase material (SMORS) is shown to be the product of reactive fuel constituents and intermediate to the formation of fuel insoluble sludge. The composition of this material changes during blending processes and tends to become more oxygen rich and thus more polar. Elemental analysis, average molecular weight and pyrolysis mass spectral data are presented for SMORS from a number of representative blended fuels and their blending stocks. SMORS has been shown to be made up of oxidized trimers, tetramers and possibly higher n-mers of nitrogen containing precursors originally present in the fuel. It is not possible to determine the SMORS precursors in field aged fuel (such as those in this study) since these precursors are essentially depleted from the fuel by the time very small amounts of SMORS have been formed.

20681 (CONF-941022–Vol.2, pp. 743-760) **The effect of increased refining on the lubricity of diesel fuel.** Lacey, P.I. (Southwest Research Institute, San Antonio, TX (United States)); Westbrook, S.R. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995. Contract DAAK70-87-C-0043; Contract DAAK70-92-C-0059. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

The United States and Europe are mandating increasingly severe diesel fuel specifications, particularly with respect to sulfur content, and in some areas, aromatics content. This trend is directed towards reducing vehicle exhaust emissions and is generally beneficial to fuel quality, ignition ratings, and stability. However,

laboratory studies, as well as recent field experience in Sweden and the United States, indicate a possible reduction in the ability of fuels to lubricate sliding components within the fuel injection system. These factors, combined with the trend toward increasing injection pressure in modern engine design, are likely to result in reduced durability and failure of the equipment to meet long-term emissions compliance. The Belvoir Fuels and Lubricants Research Facility (BFLRF) developed an accelerated wear test that predicts the effects of fuel lubricity on injection system durability. This test now has been widely used by fuel, additive, and equipment manufacturers. Several thousand fuel samples have been evaluated to date, and collectively, they form one of the largest data bases on fuel lubricity currently in existence. This range of data permits a good overview of the commercially available fuels and confirms a general decrease in fuel lubricity due to increasing refining severity. The results indicate that no high-sulfur fuel (> 0.12 wt%) had poor lubricity, while a number of low-sulfur fuels (< 0.05 wt%) did produce unacceptable wear. The lubricity of many severely refined fuels is probably being restored using relatively high concentrations of additive.

20682 (CONF-941022–Vol.2, pp. 761-775) **Stabiliser additive performance in diesel fuels and gas oils meeting new environmental targets.** Batt, R.J. (Associated Octel Company Ltd., Milton Keynes (United Kingdom)); Henry, C.P.; Whitesmith, P.R. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

Stabilizer additives have for many years been used to inhibit sediment and gum formation in middle distillates, both to meet national specifications and to allow maximum refinery flexibility. The greater emphasis increasingly placed on air quality requires the production of fuels which not only meet the technical requirements of the end user but which also minimize exhaust pollutant levels. Clean air legislation has targeted sulphur and aromatic contents as a method of reducing noxious emissions. Both can be reduced at the refinery by hydrogen treatment but such processes can have implications for fuel stability. The effects of hydrogen treatment processes on traditionally measured fuel parameters are evaluated and the suitability of these methods for predicting field stability discussed. Potential new problems resulting from increased processing and the resultant removal of natural antioxidants are identified, and the ability of stabilizer and antioxidant additives to resolve these difficulties demonstrated.

20683 (CONF-941022–Vol.2, pp. 777-791) **US diesel fuel reformulation: Additive technology in response to changing fuel properties.** Street, J.P. (Nalco/Exxon Energy Chemicals, Sugar Land, TX (United States)); Muth, C.L.; Porlier, B.W. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

Rules promulgated by the US Environmental Protection Agency have forced US refiners and importers to radically change their product. While gasoline has held most of the attention, the regulations covering mid-distillates are also extensive, beginning with particulate and emissions standards in the mid-1980's and ending with the reformulation rules that began in October 1993. The assessment of sulfur and aromatic content as deleterious resulted in the final rules for on-highway fuels which specify a 0.05 wt.% limit on sulfur content and a fuel cetane index $\geq$ 40 to control aromatics. Fuels not meeting the on-highway requirements are required to be dyed blue (later changed to red) for easy identification. Most refineries have built or converted hydrotreaters to meet low-sulfur demands. Deep hydrotreating, besides reducing sulfur may change many of the physical/performance properties of the new fuel. Issues and concerns have been raised regarding lubricity, conductivity, corrosion protection, fuel detergency, and low temperature handling properties of the on-highway fuel. Cetane number and stability could be predicted to improve. In practice, however, very slight cetane improvement (approximately 1 cetane number) is being realized. Color stability is greatly improved by hydrotreating, but the same improvement in sediment control has not been uniformly observed. While sludge formation is generally reduced, the inherent solvency of the hydrotreated fuel may also be reduced and sediments may still form. Fuel stability additives can effectively control the residual propensity for sediment formation. Hydrotreating also reduces fuel lubricity, conductivity and corrosion protection. This paper will discuss the additive technology that is effective in meeting the industry needs mentioned above resulting from the October, 1993 US diesel reformulation.

20684 (CONF-941022–Vol.2, pp. 793-802) **The effects of dyeing diesel fuel "blue".** Beal, E.J. (Naval Research Lab., Washington, DC (United States)); Hardy, D.R.; Turner, L.M.; Martin, C.J. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

The recent requirement that a blue dye be added to all high sulfur, off-highway diesel fuels raised many concerns among diesel fuel users about the detrimental effects on the fuel of the addition of the blue dye. In order to assess the immediate effect of the blue dye on contamination, the Naval Research Laboratory examined 6 F-76 fuels and all 15 possible 50:50 combinations of these fuels. All fuels were filtered before dyeing to set existing contamination levels to 0 mgs/L. Each fuel was dyed with 30ppm, w/v, of blue dye and allowed to stand for 24 hours in the dark at ambient laboratory conditions. A modified D5452, "Test Method for Particulate Contamination in Aviation Fuels by Laboratory Filtration" was used to gravimetrically determine the amount of filterable contamination formed in the fuels. The results of these tests, which show that the blue dye caused an immediate detrimental effect in all 6 fuels and 15 fuel combinations, will be given.

20685 (CONF-941022–Vol.2, pp. 803-812) **Lubricity characteristics of low sulfur, low aromatic content naval distillate fuel.** Strucko, R. (Naval Surface Warfare Center, Annapolis, MD (United States)); Giannini, R.M.; Shaver, B.D.; Lacey, P.I. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

California-type diesel fuels are restricted to a maximum sulfur content of 0.05 wt% and a maximum aromatics content of 10 vol% because of environmental regulations. However, there have been instances where these fuels have exhibited low-lubricity characteristics in over-the-road diesel engine operations. The US Navy may be required to use this type of fuel in the near future when operating in California coastal waters. The Navy, therefore, has initiated a program to determine the effects that the increased refining severity employed to achieve the lower sulfur and aromatic limits will have on lubricity, and hence, durability of fuel handling and diesel fuel injection equipment. Fuels conforming to Military Specification MIL-F-1688H, Fuel Naval Distillate (NATO F-76) were obtained from five refineries worldwide. This fuel is the primary fuel used in all US Navy surface ships. Lubricity evaluations will employ the Ball-On-Cylinder Lubricity Evaluator, ASTM D 5001 and the US Army Scuffing Load Wear Test method. A modification to the above tests may be required to account for the uniquely high salt and moisture concentration in Navy fuels before lubricity evaluations of a forty-two sample test fuel matrix will begin.

20686 (CONF-941022–Vol.2, pp. 813-819) **Thermal stability of diesel fuels by quantitative gravimetric JFTOT.** Beal, E.J. (Naval Research Lab., Washington, DC (United States)); Hardy, D.R. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995.

From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

The gravimetric jet fuel total oxidation tester (JFTOT) was developed several years ago to provide JFTOT conditions which measure quantitatively the solid/deposit products formed in aviation fuels. The gravimetric JFTOT has now been used to measure these products in a small set of typical diesel fuels. These baseline data are compared to a much larger data base of jet fuels and also several pure compounds. Results from the diesels indicate that the gravimetric JFTOT is a useful concept for ranking fuels for their thermal stability. The diesels ranged from quite low (better than jet) to quite high (an order of magnitude greater than jet fuel) in their deposit forming tendencies. Properly ranked fuels can be used in device tests such as diesel injectors and gas turbine nozzles to assess deposition. In addition, diesels with appropriate viscosities may be able to be used as aviation fuels provided the gravimetric JFTOT gives a low deposition rating.

20687 (CONF-941022–Vol.2, pp. 821-828) **Stability of light straight run diesel fuel during long term underground storage in small size steel tanks.** Geva, J. (Israel Institute for Biological Research, Ness-Ziona (Israel)); Propes, J.; Fass, R.; Sufrin, Y.; Weiss, A.; Schuftan, M.; Lavy, Z. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

Three batches of Light Straight Run Diesel Fuel (LSRDF), dyed by a green marker, were stored for five years in precleaned 50,OOOL, steel, cylindrical, underground storage tanks, with or without biocide and a stabilizer additives package. During this period, the fuels were kept dormant and no draining operations were performed. A close follow up on the chemical properties, biocide content and the level of microbial contamination, in the stored fuels, was done throughout the storage experiment. The chemical properties of the untreated fuel remained unchanged but the microbial contamination in "bottom-bottom" samples gradually increased during the first year and remained high for the next four years. In contrast, no microbial activity was found in the treated fuel tanks. However, in the fuel treated only by biocide, the dye green marker gradually diminished while "acidic" odor emitted, however the fuel stayed within chemical specifications range. Fuel treated with stabilizer additives package kept its chemical properties unchanged for the five years storage. The results indicated that untreated LSRDF can be stored for at least five years without any significant microbial or chemical damage, provided good starting condition and no turnover taken place. The biocide treated effectively hindered microbial activity but enhanced a slight oxidation activity in the fuel. Stabilizer additive addition prevented this minor oxidation, while keeping the fuel and the storage tank free from microbial contamination.

20688 (CONF-941022–Vol.2, pp. 829-842) **Storage stability of light cycle oil: Studies for the root substance of insoluble sediment formation.** Motohashi, Katsunori (Chemicals Inspection & Testing Institute, Tokyo (Japan)); Nakazono, Kingo; Oki, Masami. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

The storage stabilities of a raw and pretreated light cycle oils (LCOs) have been studied under the condition of ASTM D2274-88. The raw LCO was pretreated by five methods; 10% sulfuric acid-extraction, 10% sodium hydroxide-extraction, methanol-extraction, active clay- treatment, and catalytic hydrotreating. The raw and pretreated LCOs were aged at 95°C for 144 hours while oxygen was bubbled. The pretreatment except 10% sulfuric acid-extraction showed the decreasing sediments. After removing the sediments by filtration, the changes of component of the residual oils before and after aging, were analyzed by GUMS, GC/AED and GC/NPD. Remarkable changes were observed in nitrogen compounds such as anilines and indoles, sulfur compounds such as thiophenols, and oxygen compounds such as phenol and its derivatives. It was clarified that the sediment formation was caused by the mutual interactions among heteroatom-containing compounds mentioned above. In addition, unstable hydrocarbons were suggested to behave as key-compounds for sediment formation.

20689 (CONF-941022–Vol.2, pp. 843-849) **Automatic stability analyzer of heavy fuel oils.** Pilvioe, O. (Neste oy, Porvoo (Finland)). USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

NESTE has a long history in development of production process and in the improvement of product quality by increasing automated quality adjustment and control. The objective has been to raise production efficiency and to ensure the maintenance of quality levels when using different crude oil grades, and to make economically such products that meet the requirements of the market.

20690 (CONF-941022–Vol.2, pp. 875-888) **Analysis of sulfur-organic compounds in jet fuel by chromatographic sniffing and gas chromatography with atomic emission detector.** Skoog, P.A. (Celsius Materialteknik AB, Linkoeping (Sweden)). USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

When the Swedish Air Force changed fuel from Jet B to Jet A-1 during 1991-1992, a working environmental problem was reported from the military air force bases. The symptoms were unpleasant odor, headache and indisposition. This problem arose from some batches of the new fuel, Jet A-1. In order to investigate the compounds in the fuel which gave rise to this problem a chromatographic sniffing technique (sensory analysis) was used. The identification of the compounds from the sniffing analysis was done with a atomic emission detector for gas chromatography. The problem stemmed from relatively volatile sulfur-organic compounds. An interesting question is if these compounds also are strongly involved in the fuel system deposit formation. This presentation shows this new analysis technique and the complex pattern of sulfur-organic compounds related to fuels from different refinery processes.

20691 (CONF-941022–Vol.2, pp. 889-903) **Automated deposit-measuring device (ADMD).** Stavinoha, L.L. (Southwest Research Institute, San Antonio, TX (United States)); McInnis, L.A. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

The Automated Deposit-Measuring Device (ADMD) was developed and fabricated for the evaluation of lacquer-type fuel and lubricant deposits on Jet Fuel Thermal Oxidation Test (JFTOT), ASTM D 3241, heater test tubes. The ADMD employs commercially available components that provide enhanced speed and accuracy of data acquisition as well as improved maintainability, as compared to the prototype Deposit-Measuring Device (DMD) developed in an Army/Navy program. Application of power to the ADMD automatically brings up an operator selection menu on the vacuum fluorescent display. One of five modes of operation can be selected, including both short and long JFTOT tube length and

transference of data from random access memory (RAM) to a personal computer (PC) diskette, if the ADMD is already attached to a PC. Maximum breakdown voltage for the DMD is 1,500 volts, compared to 1,372 volts in the ADMD. This difference in voltage will affect maximum measurable volume of deposit, causing the ADMD to sometimes yield a smaller total volume than the DMD. This fact is a problem only with the thicker deposits. The repeatability of the ADMD is at least as reliable as that of the DMD. Comparison of the ADMD values with the old and current values of the DMD reveals a compatibility between the two devices. The correlation between the volume of deposit of the ADMD and carbon burnoff is superior to the correlation between the volume of deposit of the DMD and carbon burnoff. The ADMD is a viable and reliable instrument for measuring deposit on JFTOT standard and long test tubes. This report describes the ADMD features and compares correlations to DMD data and carbon burnoff data. Advantages and limitations of ADMD-derived data are demonstrated and discussed.

20692 (CONF-941022–Vol.2, pp. 905-917) **Investigation of sensitivity to microbial infection of diesel fuel at the refinery stage.** Thomsen, E.S. (Soren Schierbeck & Co., Helsingor (Denmark)); Petersen, S. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

In the practice of a company dealing with microbial problems of contaminated fuels, it was possible to use associations of microorganisms in research. These associations of "wild" microorganisms appeared successful in the environment of ship's fuel tanks, causing severe problems at the consumer level. Fresh "raw" diesel fuel was treated with the cultures to investigate the sensitivity of the fuel to microbial contamination at the refinery stage. The fuel samples received from Danish refineries were specified as free of any additives or biocides. Before treatment the samples were tested for the presence of inhibiting substances or contamination. Samples of "raw" fuel were added at 1/10, 1/100 and 1/1000 of contaminated fuel, incubated at 27°C and observed for 14 days. Other samples were incubated at 5°C and combinations of periods at 5° and 27°C. In the absence of water or nutrients the contaminant did not appear to survive and colonize the "raw" fuel, although one sample did produce microbial growth in an order of magnitude corresponding to common definitions of fuel infections. The ability of the two relevant associations of "wild" microorganisms to contaminate the "raw" diesel fuel was not clearly demonstrated at this point.

20693 (CONF-941022–Vol.2, pp. 919-928) **Predicting stability at the refinery using SMORS.** Wechter, M.A. (Univ. of Massachusetts, Dartmouth, MA (United States)); Hardy, D.R. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.* 514p. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

Previous work has described the relationship between the methanol extractable, hexane insoluble material isolated from aged fuel stocks and storage instability. A predictive test for stability which uses this relationship has been suggested for field use. This paper presents results derived from refinery fresh fuel stocks upon being subjected to a standard storage stability test (ASTM D 5304) and subsequent isolation and quantification of SMORS from the filtered product. Additional evidence which links the extractable material (SMORS) with insoluble sediment formed during long term storage is also presented. The authors suggest a predictive test for fuel stability which might be used as early as the refinery and which might serve as a basis for recommending storage terms for fuel stocks.

Exploration strategies are needed to identify subtle basement features critical to locating fractured regions in advance of drilling in tight gas reservoirs. The Piceance Basin served as a demonstration site for an analysis utilizing aeromagnetic surveys, remote sensing, Landsat Thematic Mapper, and Side Looking Airborne Radar imagery for the basin and surrounding areas. Spatially detailed aeromagnetic maps were used to to interpret zones of basement structure.

20697 (DOE/MC/30139–95/C0457) **Preliminary geologic characterization of Upper Cretaceous and Lower Tertiary low-permeability (tight) gas bearing rocks in the Wind River Basin, Wyoming.** Johnson, R.C.; Finn, T.M.; Keefer, W.R.; Flores, R.M.; Keighin, C.W.; Szmajter, R.J.; Nuccio, V.F. Geological Survey, Denver, CO (United States). Petroleum Geology Branch. [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AT21-93MC30139. The geology and stratigraphy of natural gas deposits in the Wind River Basin, Wyoming, was investigated. The study will be utilized to help determine the gas potential of the basin.

20698 (DOE/MC/30139–3971) **Nonassociated gas resources in low-permeability sandstone reservoirs, lower tertiary Wasatch Formation, and upper Cretaceous Mesaverde Group, Uinta Basin, Utah.** Fouch, T.D.; Schmoker, J.W.; Boone, L.E.; Wandrey, C.J.; Crovelli, R.A.; Butler, W.C. Geological Survey, Lakewood, CO (United States). Aug 1994. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AT21-93MC30139. Order Number DE95000055. Source: OSTI; NTIS; GPO Dep.

The US Geological Survey recognizes six major plays for nonassociated gas in Tertiary and Upper Cretaceous low-permeability strata of the Uinta Basin, Utah. For purposes of this study, plays without gas/water contacts are separated from those with such contacts. Continuous-saturation accumulations are essentially single fields, so large in areal extent and so heterogeneous that their development cannot be properly modeled as field growth. Fields developed in gas-saturated plays are not restricted to structural or stratigraphic traps and they are developed in any structural position where permeability conduits occur such as that provided by natural open fractures. Other fields in the basin have gas/water contacts and the rocks are water-bearing away from structural culmination's. The plays can be assigned to two groups. Group 1 plays are those in which gas/water contacts are rare to absent and the strata are gas saturated. Group 2 plays contain reservoirs in which both gas-saturated strata and rocks with gas/water contacts seem to coexist. Most units in the basin that have received a Federal Energy Regulatory Commission (FERC) designation as tight are in the main producing areas and are within Group 1 plays. Some rocks in Group 2 plays may not meet FERC requirements as tight reservoirs. However, we suggest that in the Uinta Basin that the extent of low-permeability rocks, and therefore resources, extends well beyond the limits of current FERC designated boundaries for tight reservoirs. Potential additions to gas reserves from gas-saturated tight reservoirs in the Tertiary Wasatch Formation and Cretaceous Mesaverde Group in the Uinta Basin, Utah is 10 TCF. If the potential additions to reserves in strata in which both gas-saturated and free water-bearing rocks exist are added to those of Group 1 plays, the volume is 13 TCF.

20699 (DOE/MC/31182–95/C0479) **Fractal modeling of natural fracture networks.** Ferer, M.; Dean, B.; Mick, C. West Virginia Univ. Research Corp., Morgantown, WV (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG21-94MC31182. (CONF-950494–10: Natural gas research, development and demonstration contractors review meeting, Baton Rouge, LA (United States), 4-6 Apr 1995). Order Number DE95012263. Source: OSTI; NTIS; GPO Dep.

West Virginia University will implement procedures for a fractal analysis of fractures in reservoirs. This procedure will be applied to fracture networks in outcrops and to fractures intersecting horizontal boreholes. The parameters resulting from this analysis will be used to generate synthetic fracture networks with the same fractal characteristics as the real networks. Recovery from naturally fractured, tight-gas reservoirs is controlled by the fracture network. Reliable characterization of the actual fracture network in the reservoir is severely limited. The location and orientation of fractures intersecting the borehole can be determined, but the length of these fractures cannot be unambiguously determined. Because of the lack of detailed information about the actual fracture network, modeling methods must represent the porosity and permeability associated with the fracture network, as accurately as possible with very little a priori information. In the sections following, the authors will (1) present fractal analysis of the MWX site, using the box-counting procedure; (2) review evidence testing the fractal nature of fracture distributions and discuss the advantages of using the fractal analysis over a stochastic analysis; and (3) present an efficient algorithm for producing a self-similar fracture networks which mimic the real MWX outcrop fracture network.

0303 Drilling, Production, and Processing

20700 (DOE/MC/26026–4058) **A novel geotechnical/geostatistical approach for exploration and production of natural gas from multiple geologic strata. [Quarterly] technical progress report, January–March 1995.** Brunk, R.G. West Virginia Coll., Beckley, WV (United States). Apr 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-89MC26026. Order Number DE95014979. Source: OSTI; NTIS; GPO Dep.

The project objective is to verify a development strategy for high grading areas of multistrata (shallow gas sand and coalbeds) potential in southern West Virginia and test it in up to five wells. Accomplishments for the quarter are presented briefly for the following tasks: Alaskan energy development;dewatering/production extension test period; and demonstrate newly developed technologies for multi strata gas and water production to enhance commercial application.

20701 (DOE/MC/28178–95/C0467) **Evaluation of high-efficiency gas liquid contactors for natural gas processing.** Palla, N.; Lee, A.L. Institute of Gas Technology, Des Plaines, IL (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States);Gas Research Inst., Chicago, IL (United States). DOE Contract FC21-92MC28178. (CONF-950494–18: Natural gas research, development and demonstration contractors review meeting, Baton Rouge, LA (United States), 4-6 Apr 1995). Order Number DE95012309. Source: OSTI; NTIS; GPO Dep.

The objectives of this program are to develop and evaluate advanced processing technologies that can reduce the cost of upgrading sub quality natural gas to pipeline standards. The successful application of cost-effective, new technologies will facilitate the production of sub quality natural gas that otherwise would be too expensive to produce. The overall program is focused on the following activities: evaluation of the potential of structured packing for the removal of acid gases from natural gases, and expansion of the currently available database of the fluid dynamics of rotating gas liquid contactors. The natural gas sweetening, structured packing field tests are scheduled to be conducted in calendar year 1995. Design, procurement and construction of the field test unit. Expansion of the available data base on the hydraulic characteristics of a rotating gas-liquid contactor is being pursued through a series of laboratory experiments. A 100 GPM, low pressure rotary contactor system has been assembled at IGT's Energy Development Center to examine the fluid dynamic behavior of this type of contactor. The studies are determining the effects of liquid viscosity, liquid surface tension and operating conditions on liquid residence times and flooding limits.

20702 (DOE/MC–29252-95/C0460) **Development of a Near-Bit MWD system.** McDonald, W.J.; Pittard, G.T. Maurer Engineering, Inc., Houston, TX (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC29252. (CONF-950494–13: Natural gas research, development and demonstration contractors review meeting, Baton Rouge, LA (United States), 4-6 Apr 1995). Order Number DE95012312. Source: OSTI; NTIS; GPO Dep.

The project objective is to develop a measurements-while-drilling (MWD) module that provides real-time reports of drilling conditions at the bit. The module is to support multiple types of sensors and to sample and encode their outputs in digital form under microprocessor control. The assembled message is to be electromagnetically transmitted along the drill string back to its associated receiver located in a collar typically 50–100 feet above the bit. The receiver demodulates the transmitted message and passes it data to the third party wireline or MWD telemetry system for relay to the surface. The collar also houses the conventional MWD or wireline probe assembly. The completed Phase 1 program began with the preparation of detailed performance specifications and ended with the design, fabrication and testing of a functioning prototype. The prototype was sized for operation with 6-3/4-inch multi-lobe mud motors due to the widespread use of this size motor in horizontal and directional drilling applications. The Phase 1 prototype provided inclination, temperature and pressure information. The Phase 2 program objective is to expand the current sensor suite to include at least one type of formation evaluation measurement, such as formation resistivity or natural gamma ray. The Near-Bit system

will be subjected to a vigorous series of shock and vibration tests followed by field testing to ensure it possesses the reliability and performance required for commercial success.

20703 (DOE/MC/29470–95/C0466) **Low quality natural gas sulfur removal/recovery.** Siwajek, L.A. (Acrion Technologies, Inc., Cleveland, OH (United States)); Kuehn, L. CNG Research Co., Pittsburgh, PA (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29470. (CONF-950494–17: Natural gas research, development and demonstration contractors review meeting, Baton Rouge, LA (United States), 4-6 Apr 1995). Order Number DE95012310. Source: OSTI; NTIS; GPO Dep.

The project comprises a Base Program and an Optional Program. The Base Program, which included NEPA reporting, process design and an experimental research plan for the optional program, was completed August 31, 1993 with submission of the Task 2 Final Report. The Optional Program, Task 3, began in July 1994. The project goal is to further develop and demonstrate two of the component technologies of the CFZ-CNG Process: (1) pilot-scale triple-point crystallization of carbon dioxide, producing commercially pure carbon dioxide from contaminated carbon dioxide at the rate of 25 ton/day, and (2) bench-scale modified high pressure Claus technology, recovering elemental sulfur from hydrogen sulfide at the rate of 200 lb/day.

20704 (DOE/MC/30070–95/C0470) **Application of microseismic technology to hydraulic fracture diagnostics: GRI/DOE Field Fracturing Multi-Sites Project.** Wilmer, R. (CER Corp., Las Vegas, NV (United States)); Warpinski, N.R.; Wright, T.B.; Branagan, P.T.; Fix, J.E. CER Corp., Las Vegas, NV (United States). [1995]. 19p. Sponsored by USDOE, Washington, DC (United States);Gas Research Inst., Chicago, IL (United States). DOE Contract FC21-93MC30070. (CONF-950494–8: Natural gas research, development and demonstration contractors review meeting, Baton Rouge, LA (United States), 4-6 Apr 1995). Order Number DE95012307. Source: OSTI; NTIS; GPO Dep.

The objective of the Field Fracturing Multi-Sites Project (M-Site) is to conduct field experiments and analyze data that will result in definitive determinations of hydraulic fracture dimensions using remote well and treatment well diagnostic techniques. In addition, experiments will be conducted to provide data that will resolve significant unknowns with regard to hydraulic fracture modeling, fracture fluid rheology and fracture treatment design. These experiments will be supported by a well-characterized subsurface environment as well as surface facilities and equipment conducive to acquiring high-quality data. It is anticipated that the project's research advancements will provide a foundation for a fracture diagnostic service industry and hydraulic fracture optimization based on measured fracture response. The M-Site Project is jointly sponsored by the Gas Research Institute (GRI) and the US Department of Energy (DOE). The site developed for M-Site hydraulic fracture experimentation is the former DOE Multiwell Experiment (MWX) site located near Rifle, Colorado. The MWX project drilled three closely-spaced wells (MWX-1, MWX-2 and MWX-3) which were the basis for extensive reservoir analyses and tight gas sand characterizations in the blanket and lenticular sandstone bodies of the Mesaverde Group. The research results and background knowledge gained from the MWX project are directly applicable to research in the current M-Site Project.

In collaboration with Cryenco Inc. and NIST-Boulder, we intend to develop a natural gas-powered natural-gas liquefier which has absolutely no moving parts and requires no electrical power. It will have high efficiency, remarkable reliability, and low cost. Progress on the liquefier to be constructed at Cryenco continues satisfactorily. The thermoacoustic driver is still ahead of the pulse tube refrigerator, because of NIST's schedule. We completed the thermoacoustics design in the fall of 1994, with Los Alamos providing physics input and checks of all aspects, and Cryenco providing engineering to ASME code, drafting, etc. Completion of this design represents a significant amount of work, especially in view of the many unexpected problems encountered. Meanwhile, Cryenco and NIST have almost completed the design of the pulse tube refrigerator. At Los Alamos, we have assembled a half-size scale model of the thermoacoustic portion of the 500 gal/day TANGL. This scale model will enable easy experimentation in harmonic suppression techniques, new stack geometries, new heat-exchanger geometries, resonator coiling, and other areas. As of March 1995, the scale model is complete and we are performing routine debugging tests and modifications.

The NGM highlights activities, events, and analyses of interest to public and private sector organizations associated with the natural gas industry. Volume and price data are presented each month for natural gas production, distribution, consumption, and interstate pipeline activities. Producer-related activities and underground storage data are also reported. From time to time, the NGM features articles designed to assist readers in using and interpreting natural gas information.

20707 (DOE/FE–0336) **Natural gas imports and exports: First quarter report 1995.** USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Fuels Programs. [1995]. 184p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95014292. Source: OSTI; NTIS; GPO Dep.

The Office of Fuels Programs prepares quarterly reports summarizing the data provided by companies authorized to import or export natural gas. Companies are required, as a condition of their authorizations, to file quarterly reports with the OFP. This quarter's focus is market penetration of gas imports into New England. Attachments show the following: % takes to maximum firm contract levels and weighted average per unit price for the long-term importers, volumes and prices of gas purchased by long-term importers and exporters, volumes and prices for gas imported on short-term or spot market basis, and gas exported short-term to Canada and Mexico.

20708 (INIS-mf–14540) **The future of gas: a global challenge. Conference book.** No corporate text available. 1995. 73p. (CONF-9503152–: 1. Doha conference on natural gas, Doha (Qatar), 13-15 Mar 1995). Order Number DE95631159. Source: OSTI; NTIS (US Sales Only); INIS.

Six papers were presented at the conference discussing global aspects of modern state and future trends of using natural gas for energy production, emphasizing economical and environmental issues.

a global challenge. Conference book. Order Number DE95631159. Source: OSTI; NTIS (US Sales Only); INIS.

This paper reviews the distribution of gas reserves both worldwide and the Middle East. As more gas is produced in difficult environments, either at long distances from markets or from more complex reservoirs there is a need to curtail costs by improving exploration success, reducing well costs and by increasing the reserves produced per well. Continuing advances in technology can make a major impact in achieving these goals. Historically, the innovative use of technology has resulted in significant increases in the value of oil and gas developments. (Author). 5 fig.

Doha conference on natural gas, Doha (Qatar), 13-15 Mar 1995). In *The future of gas: a global challenge. Conference book.* Order Number DE95631159. Source: OSTI; NTIS (US Sales Only); INIS.

There is huge gas supply potential in the Middle East, which possesses over one third of the world's natural gas reserves. However, marketed production represents only 6% of the world total, demonstrating that gas resources in the Middle East are under utilized. The value of these resources will be realized only if the gas finds a commercial outlet that guarantees proper return on investments for gas producers and the best possible use of this nonrenewable resource for governments. Apart from the chemical sector, which has provided a good outlet for natural gas, the development of natural gas resources in the region has been very limited historically, inhibited by many factors linked to the resource itself and to the characteristics of the region. However, natural gas in the Middle East is now at a crossroads, facing both major challenges and significant opportunities. The region, which currently plays only a marginal role on the world gas market, has the potential to become a leading world supplier, provided a number of political and economic conditions are fulfilled. This paper discusses some of the challenges that Middle Eastern countries face in trying to develop their natural gas resources. It reviews development potential for Middle Eastern gas reserves, whether for local use and/or exports, and it highlights future opportunities. (Author).

20711 (INIS-mf–14540, pp. 21-35) **Middle East gas export projects: The case of Abu Dhabi.** Al Marzooqi, H. (Abu-Dhabi National Oil Co., Abu Dhabi (United Arab Emirates)). No corporate text available. 1995. 73p. (CONF-9503152–: 1. Doha conference on natural gas, Doha (Qatar), 13-15 Mar 1995). In *The future of gas: a global challenge. Conference book.* Order Number DE95631159. Source: OSTI; NTIS (US Sales Only); INIS.

Abu Dhabi is ranked in the industry journals in the top 5 in the world tables of both oil and gas reserves. Gas is produced both Onshore and Offshore from associated and non-associated fields. Production has tripped during the last ten years and will increase further in the next few years as a result of current and planned investment. Development of Abu Dhabi's gas resources is aimed at enhancing oil production and recovery, meeting local and export demand and eliminating waste. Companies in Abu Dhabi are involved in all the main sectors of gas industry including production, processing, transportation and sales. The first large LNG export project by sea in Arabian Gulf was established in 1977 from Abu to Japan. Development continues and the gas is exported as LNG and is also processed into LPG and Pentane Plus for export. Japan remains the main market. The volume of Condensate available for export and processing will increase significantly in the next few years. In order to ensure a continuing and increasing supply of gas to world markets, in future years, prices will need to provide an adequate return on investment and should also reflect the environmental advantages of gas. 9 tabs.

20712 (INIS-mf–14540, pp. 36-50) **The environment and its impact on gas penetration in the energy market east.** Mabro, R.E. (Oxford Inst. for Energy Studies (United Kingdom)); Stoppard, M. No corporate text available. 1995. 73p. (CONF-9503152–: 1. Doha conference on natural gas, Doha (Qatar), 13-15 Mar 1995). In *The future of gas: a global challenge. Conference book.* Order Number DE95631159. Source: OSTI; NTIS (US Sales Only); INIS.

The thesis of this paper is that gas, although free from pollution problems is nevertheless more benign generally appreciated. The obstacles to gas penetration are flawed environmental legislation, political factors and,in some areas, a cost disadvantage relative to other fuels which turn out to be higher than the environmental premium which society is prepared to pay. (Author).

20713 (INIS-mf–14540, pp. 57-73) **The Japanese approach to financing LNG projects.** Aoki, Wataru (Qatar LNG Investment Co. (Qatar)). No corporate text available. 1995. 73p. (CONF-9503152–: 1. Doha conference on natural gas, Doha (Qatar), 13-15 Mar 1995). In *The future of gas: a global challenge. Conference book.* Order Number DE95631159. Source: OSTI; NTIS (US Sales Only); INIS.

The Japanese approach approach to financing LNG project has been what could be called a combined purchase and finance system which has been arranged mainly at the initiative of japan's Sogo Shosh (general trading companies) with the support of japanese governmental financial agencies and a purchase commitment from japanese utilities. In the QATARGAS project, despite it being the first greenfield LNG project in decade since North West Shelf Australia LNG project, financing for the LNG plant phase has been successfully arranged through Japanese financing. The structuring of the financial facilities for the QATARGAS project seems to have lessons for future development of the next generation of greenfield LNG projects. Discharge of the parties' liability, proper sharing of the risk burden and reconfirmation of the spirit of mutual understanding and trust among the parties concerned are key factors for the success of any new LNG project in the future. (Author).

20714 (INIS-mf–14549, pp. 11-15) **Consequences of increasing the consumption of gaseous fuels in national economy.** Farsky, M. (Fakulta Socialne Ekonomicka, Universita J. E. Purkyne, Usti nad Labem (Czech Republic)). DUM Techniky Usti s.r.o., Usti nad Labem (Czech Republic). Feb 1994. (In Czech). (CONF-9410360–: 4. natural gas, power industry and the environment, Usti nad Labem (Czech Republic), 25-26 Oct 1994). In *Power industry and the environment IV. Natural gas.* 173p. Order Number DE95633438. Source: OSTI; NTIS (US Sales Only); INIS.

Coal is currently the predominating energy source in the Czech Republic (a share of about 65%) as against European Union countries where oil and gas are predominantly used (about 60%). Gas imports and uses in the Czech Republic are expected to increase in the future. This increase will be primarily governed by rationalization of heating oil consumption and by a favorable trade and pricing policy. The increase in the share of gas in electricity generation will also alleviate environmental problems. Average emissions from the combustion of brown coal, bituminous coal, heating oil and natural gas are given. A forecast of primary energy source uses in the Czech Republic till 2005 is presented, and gas balance data for Germany are given. (J.B.). 3 tabs.

(CONF-9503152–: 1. Doha conference on natural gas, Doha (Qatar), 13-15 Mar 1995). In *The future of gas: a global challenge. Conference book.* Order Number DE95631159. Source: OSTI; NTIS (US Sales Only); INIS.

This paper briefly reviews the economic and non-economic considerations underlying gas exports from the GC C and the Arabian Peninsula in general. It addresses four themes: policy issues, political risks, technical risks and economics. It examines the distance between the regional resource areas and the major gas markets in the Far East and Europe, and examines the implications for moving gas to those markets in liquid form or by pipeline, in terms of number of LNG vessels required, and capital costs. (Author).

DUM Techniky Usti s.r.o., Usti nad Labem (Czech Republic). Feb 1994. (In Czech). (CONF-9410360–: 4. natural gas, power industry and the environment, Usti nad Labem (Czech Republic), 25-26 Oct 1994). In *Power industry and the environment IV. Natural gas.* 173p. Order Number DE95633438. Source: OSTI; NTIS (US Sales Only); INIS.

The advantages of natural gas as an environmentally friendly fuel are highlighted; they primarily include minimal and temporary land occupation during pipeline construction, and minimal emissions of harmful substances from combustion. The problems of emissions of nitrogen oxides and ways of their reduction are discussed. Nitrogen oxide emission data for brown coal combustion are given for comparison. Emissions of carbon dioxide from brown coal, bituminous coal, liquid fuels and natural gas are also compared, and the contributions of the fuels to the greenhouse effect are given. The favorable properties of natural gas and the feasibility of its rational use are outlined. (J.B.). 3 figs.

Problems of emissions arising from the combustion of solid, liquid and gaseous fuels are discussed. The maximum permissible concentrations of particulate matter, sulfur dioxide, nitrogen oxides, carbon dioxide, and carbon monoxide are given for energy and power generating facilities of 0.2 to 5 MW thermal output. The advantage of electricity generation and centralized heat supply experienced at the site of consumption is partly offset by the disadvantage of a large environmental burden at the site where electricity is generated and/or water heated. (J.B.). 1 tab.

In *Power industry and the environment IV. Natural gas.* 173p. Order Number DE95633438. Source: OSTI; NTIS (US Sales Only); INIS.

The consequences of converting a facility from brown coal fuel to gas fuel were analyzed by model simulation. Treated were a district heating plant with an output of 700 TJ/yr and minor local heating sources (stoves) at a density of 1 family house per 100 m^2. Emissions of particulate matter, sulfur dioxide, nitrogen oxides, carbon monoxide, and hydrocarbons before and after the conversion are given for the two types of source. Conversion of a major air pollution source to gas fuel would result in a reduction of the contribution of sulfur dioxide emissions of the order of 10^{-4}, of particulate matter and carbon monoxide of the order of 10^{-3}, and of hydrocarbons of the order of 10^{-2}. The decrease will be lowest for nitrogen oxides, viz. about 40%. Analogous data for local heating sources in towns would be 10^{-5} for sulfur dioxide, 10^{-4} for particulate matter, 10^{-3} for carbon monoxide and hydrocarbons, and roughly one order of magnitude for nitrogen oxides. (J.B.).

20720 (INIS-mf–14549, pp. 44-48) **Environmental consequences of gas fuel uses in towns.** Novak, L. (Mestsky Urad Decin, Decin (Czech Republic)). DUM Techniky Usti s.r.o., Usti nad Labem (Czech Republic). Feb 1994. (In Czech). (CONF-9410360–: 4. natural gas, power industry and the environment, Usti nad Labem (Czech Republic), 25-26 Oct 1994). In *Power industry and the environment IV. Natural gas.* 173p. Order Number DE95633438. Source: OSTI; NTIS (US Sales Only); INIS.

Gas distribution was commenced in the town of Decin in 1991. As a result, the consumption of coal decreased to less than one-half. An overview is given of the shares of coal, gas and fuel oils in heat generation in Decin, as well as of the mean annual concentrations of sulfur dioxide and nitrogen oxides over the 1989 to 1993 period.

20721 (INIS-mf–14549, pp. 56-62) **Natural gas: evaluation, control, and improvement of its environmental impacts.** Wilkinson, A. (British Gas plc, London (United Kingdom)). DUM Techniky Usti s.r.o., Usti nad Labem (Czech Republic). Feb 1994. (In Czech). (CONF-9410360–: 4. natural gas, power industry and the environment, Usti nad Labem (Czech Republic), 25-26 Oct 1994). In *Power industry and the environment IV. Natural gas.* 173p. Order Number DE95633438. Source: OSTI; NTIS (US Sales Only); INIS.

The decrease in SO_2 and NO_x emissions in the United Kingdom since 1950 resulting from a reduction in coal uses and conversion to gas heating is described. The use of gas to satisfy the increasing energy consumption expected in the Czech Republic till 2010, which corresponds to 3.2 million tons of oil equivalent, would bring about an 88 kt reduction in ash production by the power industry, and an air pollution reduction by 6 million tons of CO_2, 353 kt of SO_2, 25 kt of CO, 15 kt NO_x, and 1.6 kt of CH_4. In households, where energy use is estimated to 2 million tons of oil equivalent in 2010, the air pollution alleviation due to the replacement of lignite by gas is estimated to 5 million tons of CO_2, 307 kt of SO_2, 77 kt of particulate matter, 22 kt of CO, and 13 kt of NO_x. The RandD activities of British Gas plc in the field of quantification and characterization of relevant impacts and in the preparation of cost-effective solutions for the reduction of wastes are highlighted. (J.B.).

20722 (INIS-mf–14549, pp. 74-79) **Cogeneration units.** Dvorak, V. (Cesky Plynarensky a Naftovy Svaz, Prague (Czech Republic)). DUM Techniky Usti s.r.o., Usti nad Labem (Czech Republic). Feb 1994. (In Czech). (CONF-9410360–: 4. natural gas, power industry and the environment, Usti nad Labem (Czech Republic), 25-26 Oct 1994). In *Power industry and the environment IV. Natural gas.* 173p. Order Number DE95633438. Source: OSTI; NTIS (US Sales Only); INIS.

The principles are outlined of cogeneration, i.e. of combined generation of electricity and heat. The assets of this approach include a decrease in the consumption of primary sources, and lower air pollution. Replacement of 1000 MWe brown coal fired power sources by cogeneration units in the Czech Republic would imply the shutdown of 3 to 4 brown coal fired power plants, bringing about a reduction in SO_2, NO_x and particulate emissions by 13.4%, 7%, and 4.3%, respectively. (J.B.).

20723 (DOE/MC/31113–95/C0471) **Underground natural gas storage reservoir management.** Ortiz, I.; Anthony, R. United Energy Development Consultants, Inc., Ambridge, PA (United States). [1995]. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-94MC31113. (CONF-950494–9: Natural gas research, development and demonstration contractors review meeting, Baton Rouge, LA (United States), 4-6 Apr 1995). Order Number DE95012306. Source: OSTI; NTIS; GPO Dep.

The objective of this study is to research technologies and methodologies that will reduce the costs associated with the operation and maintenance of underground natural gas storage. This effort will include a survey of public information to determine the amount of natural gas lost from underground storage fields, determine the causes of this lost gas, and develop strategies and remedial designs to reduce or stop the gas loss from selected fields. Phase I includes a detailed survey of US natural gas storage reservoirs to determine the actual amount of natural gas annually lost from underground storage fields. These reservoirs will be ranked, the resultant will include the amount of gas and revenue annually lost. The results will be analyzed in conjunction with the type (geologic) of storage reservoirs to determine the significance and impact of the gas loss. A report of the work accomplished will be prepared. The report will include: (1) a summary list by geologic type of US gas storage reservoirs and their annual underground gas storage losses in ft^3; (2) a rank by geologic classifications as to the amount of gas lost and the resultant lost revenue; and (3) show the level of significance and impact of the losses by geologic type. Concurrently, the amount of storage activity has increased in conjunction with the net increase of natural gas imports as shown on Figure No. 3. Storage is playing an ever increasing importance in supplying the domestic energy requirements.

20724 (DTU-LV–95-13) **Natural gas/solar heating systems. Market analysis.** Boye-Hansen, L.; Furbo, S. Danmarks Tekniske Univ., Lyngby (Denmark). Lab. for Varmeisolering. Jun 1995. 21p. (In Danish). Contract ENS-51181-94.0092. Order Number DE95787735. Source: OSTI; NTIS.

It has been shown that if solar heating systems are installed at the same time as natural gas systems, costs will be reduced by half. Here a boiler would be attached to the wall and a separate hot water tank, heated up by both the natural gas boiler and the solar collectors, would be utilized. An investigation based on telephone interviews was made in order to analyse the market for such combined systems. The investigation is described and the results are discussed. (AB)

20725 (LUTMDN-TMVK–7021) **Time resolved measurements of flow fields and heat release in pulse combustors.** Lindholm, A. Lund Univ. (Sweden). Dept. of Heat and Power Engineering. May 1995. 64p. Order Number DE95779305. Source: OSTI; NTIS.

Pulsating combustion is a non-steady combustion process where quantities like pressure, temperature, velocity etc., oscillate periodically in time. The oscillations occur spontaneously due to interaction between pressure oscillations and heat release. Pulsating combustion offers advantages like high heat transfer and low emissions of NO_x and CO and a potential of simple design. In this work detailed measurements in the combustion chamber were performed in order to get information about fundamental processes that control the combustion and the operating characteristics of a pulse combustor. An increased theoretical and experimental knowledge may provide possibilities to control the combustion process, and that knowledge can be transferred to a design tool for pulse combustors with very low levels of exhaust emissions and high combustion efficiency. An experimental investigation of flow fields and CH-radical fields in two different combustion chambers of different pulse combustors was performed. Results from measurements from an axisymmetric (square cross section) combustion chamber were compared to measurements from a 'flat' combustion chamber. The results indicate that the fluid dynamic mixing that takes place in the vortices created by the flame holder and the air to fuel ratio control the phase shift between the heat release and pressure. Therefore, it seems likely to achieve operation characteristic control by this means. The emission levels of NO_x are not influenced so much by internal flue gas recirculation from the tail pipe as by the air to fuel ratio and short residence time at high temperatures. Measurements used to support the development of a simulation model indicate that it is possible to simulate the important features of the flow. 45 refs, 34 figs, 8 tabs

Final report, July 1989–September 1993.** Oblad, A.G.; Bunger, J.W.; Dahlstrom, D.A.; Deo, M.D.; Fletcher, J.V.; Hanson, F.V.; Miller, J.D.; Seader, J.D. Utah Univ., Salt Lake City, UT (United States). Mar 1994. 600p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-89MC26268. Order Number DE94012256. Source: OSTI; NTIS; GPO Dep.

Research and development of surface extraction and upgrading processes of western tar sands are described. Research areas included modified hot water, fluidized bed, and rotary kiln pyrolysis of tar sands for extraction of bitumen. Bitumen upgrading included solvent extraction of bitumen, and catalytic hydrotreating of bitumen. Characterization of Utah tar sand deposits is also included.

20727 (DOE/MC/27286–3310) **The development of an integrated multistaged fluid bed retorting process. Technical report, October 1, 1992–December 31, 1992.** Taulbee, D. (and others); Fei, Y.; Carter, S. Kentucky Univ., Lexington, KY (United States). Center for Applied Energy Research. Jan 1993. 24p. Sponsored by USDOE, Washington, DC (United States). The KENTORT II process includes integral fluidized bed zones for pyrolysis, gasification, and combustion of the oil shale. The purpose of this program is to design and test the KENTORT II process at the 50-lb/hr scale. Along with the major activity of assembling the components of the 50-lb/hr retort, work was also completed in other areas this quarter. Basic studies of the cracking and coking kinetics of model compounds in a fixed bed reactor were continued. Additionally, as part of the effort to investigate niche market applications for KENTORT II-derived products, a study of the synthesis of carbon fibers from the heavy fraction of KENTORT II shale oil was initiated.

20728 (JAERI-Research–95-020) **Electron temperature of resonance photoionization plasma measured with Langmuir probe.** Ogura, Koichi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Shibata, Takemasa. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 21p. (In Japanese). Order Number DE95780613. Source: OSTI; NTIS; INIS.

Gadolinium plasma was produced in such a way that gadolinium atoms were ionized by two-wavelength two-step laser photoionization with pulsed lasers. Here, an ionization scheme was chosen so as to emit a photoelectron with the kinetic energy of 0.006eV. The electron temperature of plasma was measured with a Langmuir probe 40μs after plasma production. The electron temperature of 0.02-0.03eV was obtained. The real electron temperature was considered to be below 0.02eV considering the uneven work function on probe surface. The electron temperature was much lower than

the atomic excitation temperature of 0.05 to 0.08eV. The temperature did not approach to the atomic excitation temperature through excitation and de-excitation reactions between gadolinium atoms and electrons, since the atomic density was low in this experiment. (author).

20729 (BNL–61520) **Multiple-linac approach for tritium production and other applications.** Ruggiero, A.G. Brookhaven National Lab., Upton, NY (United States). 10 Jan 1995. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95008859. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes an approach to tritium production based on the use of multiple proton linear accelerators. Features of a single APTT Linac as proposed by the Los Alamos National Laboratory are presented and discussed. An alternative approach to the attainment of the same total proton beam power of 200 MW with several lower-performance superconducting Linacs is proposed and discussed. Although each of these accelerators are considerable extrapolations of present technology, the latter can nevertheless be built at less technical risk when compared to the single high-current APT Linac, particularly concerning the design and the performance of the low-energy front-end. The use of superconducting cavities is also proposed as a way of optimizing the accelerating gradient, the overall length, and the operational costs. The superconducting technology has already been successfully demonstrated in a number of large-size projects and should be seriously considered for the acceleration of intense low-energy beams of protons. Finally, each linear accelerator would represent an ideal source of very intense beams of protons for a variety of applications, such as: weapons and waste actinide transmutation processes, isotopes for medical application, spallation neutron sources, and the generation of intense beams of neutrinos and muons for nuclear and high-energy physics research. The research community at large has obviously an interest in providing expertise for, and in having access to, the demonstration, the construction, the operation, and the exploitation of these top-performance accelerators.

An induction heated vacuum furnace was developed for recovering actinides from spent reactor fuel. It was tested by melting 2.7 kg U in beryllia, the retort tested with Zn and Mg.

20735 (BNWL-CC–2591-Rev.1) **Preliminary project proposal for process area ventilation modifications 231-Z Building. Revision 1.** Walters, R.W. Battelle-Northwest, Richland, WA (United States). Pacific Northwest Lab. 13 Jul 1970. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95010033. Source: OSTI; NTIS; GPO Dep.

It is proposed to design and install a new heating and ventilation system for the process area of 231-Z Building. The proposed system provides increased ventilation capacity to meet the present process requirements of the building with capacity for modest expansion. A mechanical refrigeration recirculating type system will be utilized in order to improve the process environment by controlling humidity within reasonable limits. The project includes demolition and removal of the existing ventilation system and construction of a new equipment room to house the new equipment. No changes are proposed in the present equipment process exhaust system.

20736 (LA–12938) **Reliability analysis for the facility data acquisition interface system upgrade at TA-55.** Turner, W.J.; Pope, N.G.; Brown, R.E. Los Alamos National Lab., NM (United States). May 1995. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95012117. Source: OSTI; NTIS; INIS; GPO Dep.

Because replacement parts for the existing facility data acquisition interface system at TA-55 have become scarce and are no longer being manufactured, reliability studies were conducted to assess various possible replacement systems. A new control system, based on Allen-Bradley Programmable Logic Controllers (PLCs), was found to have a likely reliability 10 times that of the present system, if the existing Continuous Air Monitors (CAMS) were used. Replacement of the old CAMs with new CAMs will result in even greater reliability as these are gradually phased in. The new PLC-based system would provide for hot standby processors, redundant communications paths, and redundant power supplies, and would be expandable and easily maintained, as well as much more reliable. TA-55 is the Plutonium Processing Facility which processes and recovers Pu-239 from scrap materials.

20737 (WHC-SD-CP-TC–033) **Test procedure for anion exchange testing with Argonne 10-L solutions.** Compton, J.A. Westinghouse Hanford Co., Richland, WA (United States). 17 May 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013350. Source: OSTI; NTIS; INIS; GPO Dep.

Four anion exchange resins will be tested to confirm that they will sorb and release plutonium from/to the appropriate solutions in the presence of other cations. Certain cations need to be removed from the test solutions to minimize adverse behavior in other processing equipment. The ion exchange resins will be tested using old laboratory solutions from Argonne National Laboratory; results will be compared to results from other similar processes for application to all plutonium solutions stored in the Plutonium Finishing Plant.

20738 (ANL/EA/CP–84161) **Assessment of risks to individuals from the transportation of radioactive materials.** Biwer, B.M.; Monette, F.A.; LePoire, D.J.; Chen, S.Y. Argonne National Lab., IL (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950216–148: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95013392. Source: OSTI; NTIS; INIS; GPO Dep.

The radiological impacts to individuals from the transportation of radioactive materials must be assessed when evaluating alternatives for major federal actions as required by the National Environmental Policy Act. Public comments on past environmental impact statements indicate that the public is concerned about the risks of radiation exposure to individuals along a transport route from radioactive materials shipments. Individuals may be exposed during routine, incident-free, transport of radioactive materials or, potentially, as a result of transportation accidents. This paper discusses the computer model RISKIND, which was developed at Argonne National Laboratory to estimate the potential radiological risks to individuals and population subgroups from the transportation of radioactive materials. The code was designed to use site-specific data to provide a detailed analysis for each receptor location. This type of analysis complements the traditional collective population transportation risk analyses conducted for radiological transportation risk assessments.

20739 (DOE/EA–1009) **Environmental assessment for DOE permission for off-loading activities to support the movement of commercial low level nuclear waste across the Savannah River Site.** USDOE Savannah River Operations Office, Aiken, SC (United States). Feb 1995. 18p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012239. Source: OSTI; NTIS; GPO Dep.

This environmental assessment investigates the potential environmental and safety effects which could result from the land transport of low level radioactive wastes across the Savannah River Plant. Chem-Nuclear Systems operates a low level radioactive waste burial facility adjacent to the Savannah River Plant and is seeking permission from the DOE to transport the waste across Savannah River Plant.

20740 (ORNL/PATS–95-001) **Packaging- and transportation-related occurrence reports, October-December 1994.** Welch, M.J.; Dickerson, L.S.; Armstrong, C.J. Oak Ridge National Lab., TN (United States). Feb 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95009138. Source: OSTI; NTIS; INIS; GPO Dep.

The Oak Ridge National Laboratory (ORNL) Packaging and Transportation Safety Program (PATS), which is sponsored by the U.S. Department of Energy (DOE) Office of Environment, Safety and Health, Office of Facility Safety Analysis, EH-32, has been charged with the responsibility of retrieving reports and information pertaining to transportation or packaging incidents from the Occurrence Reporting and Processing System (ORPS). These selected reports are being analyzed for trends, impact on EH-32 policies and concerns, and lessons learned concerning transportation and packaging safety. This task is designed not only to keep EH-32 aware of current packaging and transportation incidents and potential transportation and packaging problems that may need attention on DOE sites but also to allow future dissemination of lessons learned to the Operations Offices and, subsequently, to management and operating contractors. This report, which covers the period from October 2 to December 31, 1994, covers the weekly tabular reports OR-94-40 through OR-94-52. These 12 reports, which contained a total of 75 occurrence reports (ORs) relating to packaging and transportation issues, were submitted to EH-32 for its information and use during this quarter. The 75 ORs that were selected from the hundreds reviewed are listed. The second column of Table I contains the PATS nature of occurrence (NOC) coding for the respective OR, and the third column lists the weekly report issue in which the OR was originally transmitted to DOE-Headquarters (HQ). The Lesson Learned bulletins produced this quarter are included. These two bulletins have been distributed to a large packaging and transportation safety audience and are included as a natural outgrowth of the quarterly reports.

20741 (WHC-SD-SNF-DP–001) **Data compilation report: Gas and liquid samples from K West Basin fuel storage canisters.** Trimble, D.J. Westinghouse Hanford Co., Richland, WA (United States). 18 May 1995. 58p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013329. Source: OSTI; NTIS; INIS; GPO Dep.

Forty-one gas and liquid samples were taken from spent fuel storage canisters in the K West Basin during a March 1995 sampling campaign. (Spent fuel from the N Reactor is stored in sealed canisters at the bottom of the K West Basin.) A description of the sampling process, gamma energy analysis data, and quantitative gas mass spectroscopy data are documented. This documentation does not include data analysis.

20742 (WHC-SD-W058-TA–001) **Replacement of the cross-site transfer system liquid waste transport alternatives evaluation, Project W-058.** Vo, D.V.; Epperson, E.M. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012951. Source: OSTI; NTIS; INIS; GPO Dep.

This document examines high-/low-level radioactive liquid waste transport alternatives. Radioactive liquid waste will be transported from the 200 West Area to the 200 East Area and within the 200 East Areas for safe storage and disposal. The radioactive waste transport alternatives are the Aboveground Transport System (French LR-56 Cask System [3,800 L (1,000 gal)]), 19,000-L (5,000-gal) trailer tanker system, 75,700-L (20,000-gal) rail tanker system and Underground Transport System (buried pipe [unlimited transfer volume capability]). The evaluation focused on the following areas: initial project cost, operational cost, secondary waste generation, radiation exposure, and final decommissioning. The evaluation was based on the near term (1995 to 2005) estimated volume of 49.509 million L (13.063 million gal) and long term (1995 to 2028) estimated volume of 757.1 million L (200 million gal). The conclusion showed that the buried pipe (Underground Transport System) resulted in the lowest overall total cost for near and long term, the trailer container resulted in the highest total cost for near and long term, and the French truck was operationally impractical and cost prohibitive.

20743 (WHC-SD-WM-PLN–100) **Waste shipment engineering data management plan.** Marquez, D.L. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012836. Source: OSTI; NTIS; INIS; GPO Dep.

This plan documents current data management practices and future data management improvements for TWRS Waste Shipment Engineering.

20744 (WSRC-TR–95-0228) **Hydrogen Gas Generation from Mark 31 Slugs.** Rudisill, T.S. Westinghouse Savannah River Co., Aiken, SC (United States). 15 May 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060150. Source: OSTI; NTIS; GPO Dep.

With the suspension of fuel and target dissolving activities since the early 1990's, irradiated Mark 31 targets (slugs) have been stored in the L-Reactor basin for greater than 7 years. During the prolonged storage, pitting corrosion has breached the thin aluminum cladding of many slugs resulting in corrosion of the uranium core. The products of uranium and metal corrosion are highly visible on the surface of slugs and easily spread throughout the basin environment. The slugs have been placed in stainless steel boxes to prevent the accumulation of corrosion products on the basin floor. When the lids of the boxes are removed to inspect the slugs, large volumes of gas trapped inside the boxes are released. The release of an unknown gas has been identified as a potential safety concern. The physical appearance and storage conditions of the Mark 31 slugs and comparison with the analysis of gas from a leaking can of EBR-II (Experimental Breeder Reactor II) fuel provide convincing evidence that the accumulated gas is hydrogen. Both the Mark 31 slugs and the EBR-II fuel contain depleted uranium metal used for the production of plutonium. Once the uranium core of the slug and fuel assemblies are exposed, the corrosion

mechanism is the same. The analysis of the gas sample collected from the EBR-II fuel can was essentially 100% hydrogen. A black solid powder expelled from the can was also identified as highly oxidized uranium consistent with the physical appearance of uranium dioxide (UO_2). The formation of UO_2 and generation of hydrogen are consistent with the basic mechanism for the aqueous corrosion of uranium metal which is well established and reported throughout the literature.

20745 (AFIT/ENS–95-01) **Comparative life-cycle cost analysis for low-level mixed waste remediation alternatives.** Jackson, J.A.; White, T.P.; Kloeber, J.M.; Toland, R.J.; Cain, J.P.; Buitrago, D.Y. Air Force Inst. of Tech., Wright-Patterson AFB, OH (United States). Mar 1995. 302p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95011131. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this study is two-fold: (1) to develop a generic, life-cycle cost model for evaluating low-level, mixed waste remediation alternatives, and (2) to apply the model specifically, to estimate remediation costs for a site similar to the Fernald Environmental Management Project near Cincinnati, OH. Life-cycle costs for vitrification, cementation, and dry removal process technologies are estimated. Since vitrification is in a conceptual phase, computer simulation is used to help characterize the support infrastructure of a large scale vitrification plant. Cost estimating relationships obtained from the simulation data, previous cost estimates, available process data, engineering judgment, and expert opinion all provide input to an Excel based spreadsheet for generating cash flow streams. Crystal Ball, an Excel add-on, was used for discounting cash flows for net present value analysis. The resulting LCC data was then analyzed using multi-attribute decision analysis techniques with cost and remediation time as criteria. The analytical framework presented allows alternatives to be evaluated in the context of budgetary, social, and political considerations. In general, the longer the remediation takes, the lower the net present value of the process. This is true because of the time value of money and large percentage of the costs attributed to storage or disposal.

20746 (ANL–94/34) **The effects of the glass surface area/solution volume ratio on glass corrosion: A critical review.** Ebert, W.L. (Argonne National Lab., IL (United States). Chemical Technology Div.). Argonne National Lab., IL (United States). Mar 1995. 300p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95011008. Source: OSTI; NTIS; INIS; GPO Dep.

This report reviews and summarizes the present state of knowledge regarding the effects of the glass surface area/solution volume (SA/V) ratio on the corrosion behavior of borosilicate waste glasses. The SA/V ratio affects the rate of glass corrosion through the extent of dilution of corrosion products released from the glass into the leachate solution: glass corrosion products are diluted more in tests conducted at low SA/V ratios than they are in tests conducted at high SA/V ratios. Differences in the solution chemistries generated in tests conducted at different SA/V ratios then affect the observed glass corrosion behavior. Therefore, any testing parameter that affects the solution chemistry will also affect the glass corrosion rate. The results of static leach tests conducted to assess the effects of the SA/V are discussed with regard to the effects of SA/V on the solution chemistry. Test results show several remaining issues with regard to the long-term glass corrosion behavior: can the SA/V ratio be used as an accelerating parameter to characterize the advanced stages of glass corrosion relevant to long disposal times; is the alteration of the glass surface the same in tests conducted at different SA/V, and in tests conducted with monolithic and crushed glass samples; what are the effects of the SA/V and the extent of glass corrosion on the disposition of released radionuclides? These issues will bear on the prediction of the long-term performance of waste glasses during storage. The results of an experimental program conducted at ANL to address these and other remaining issues regarding the effects of SA/V on glass corrosion are described. 288 refs., 59 figs., 16 tabs.

20747 (ANL–94/42) **Yucca Mountain Project - Argonne National Laboratory annual progress report, FY 1994.** Bates, J.K.; Fortner, J.A.; Finn, P.A.; Wronkiewicz, D.J.; Hoh, J.C.; Emery, J.W.; Buck, E.C.; Wolf, S.F. Argonne National Lab., IL (United States). Feb 1995. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95010431. Source: OSTI; NTIS; INIS; GPO Dep.

This document reports on the work done by the Nuclear Waste Management Section of the Chemical Technology Division (CMT), Argonne National Laboratory, in the period October 1993-September 1994. Studies have been performed to evaluate the performance of nuclear waste glass and spent fuel samples under unsaturated conditions (low volume water contact) that are likely to exist in the Yucca Mountain environment being considered as a potential site for a high-level waste repository. Tests with simulated waste glasses have been in progress for over eight years and demonstrate that actinides from initially fresh glass surfaces will be released as a result of the spallation of reacted glass layers from the surface, as the small volume of water passes over the waste form. Studies are also underway to evaluate the performance of spent fuel samples and unirradiated UO_2 in projected repository conditions. Tests with UO_2 have been ongoing for nine years and show that the oxidation of UO_2 occurs rapidly, and the resulting paragenetic sequence of secondary phases that form on the sample surface is similar to that observed in natural analogues. The reaction of spent fuel samples under conditions similar to those used with UO_2 have been in progress for nearly two years, and the results suggest that spent fuel follows the same reaction progress as UO_2. The release of individual fission products and transuranic elements was not congruent, with the release being controlled by the formation of small particles or colloids that are suspended in solution and transported away from the waste form. The reaction progress depends on the composition of the spent fuel samples used and, likely, on the composition of the groundwater that contacts the waste form.

20748 (ANL/CMT-ACL/CP–85238) **Waste minimization in analytical methods.** Green, D.W.; Smith, L.L.; Crain, J.S.; Boparai, A.S.; Kiely, J.T.; Yaeger, J.S. Schilling, J.B. Argonne National Lab., IL (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9505111–1: 11. pollution prevention conference: shaping the future through pollution prevention involvement - commitment - progress, Knoxville, TN (United States), 16-18 May 1995). Order Number DE95011961. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) will require a large number of waste characterizations over a multi-year period to accomplish the Department's goals in environmental restoration and waste management. Estimates vary, but two million analyses annually are expected. The waste generated by the analytical procedures used for characterizations is a significant source of new DOE waste. Success in reducing the volume of secondary waste and the costs of handling this waste would significantly decrease the overall cost of this DOE program. Selection of appropriate analytical methods depends on the intended use of the resultant data. It is not always necessary to use a high-powered analytical method, typically at higher cost, to obtain data needed to make decisions about waste management. Indeed, for samples taken from some heterogeneous systems, the meaning of high accuracy becomes clouded if the data generated are intended to measure a property of this system. Among the factors to be considered in selecting the analytical method are the lower limit of detection, accuracy, turnaround time, cost, reproducibility (precision), interferences, and simplicity. Occasionally, there must be tradeoffs among these factors to achieve the multiple goals of a characterization program. The purpose of the work described here is to add waste minimization to the list of characteristics to be considered. In this paper the authors present results of modifying analytical methods for waste characterization

to reduce both the cost of analysis and volume of secondary wastes. Although tradeoffs may be required to minimize waste while still generating data of acceptable quality for the decision-making process, they have data demonstrating that wastes can be reduced in some cases without sacrificing accuracy or precision.

20749 (ANL/CMT-ACL/CP–85503) **New analytical methods to minimize secondary waste.** Green, D.W.; Smith, L.L.; Cain, J.S.; Boparai, A.S.; Kiely, J.T.; Yaeger, J.S.; Schilling, J.B. Argonne National Lab., IL (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950690–1: Laboratory safety and environmental management, Baltimore, MD (United States), 27-28 Jun 1995). Order Number DE95014229. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) will require a large number of waste characterizations over a multi-year period to accomplish the Department's goals in environmental restoration and waste management. Estimates vary, but two million analyses annually are expected. The waste generated by the analytical procedures used for characterizations is a significant source of new DOE waste. Success in reducing the volume of secondary waste and the costs of handling this waste would significantly decrease the overall cost of this DOE program. We have chosen to review the analytical procedures in three areas – sample injection for inorganic analysis, dissolution of waste samples for radiochemical analysis, and sample preparation for analysis of organic constituents.

20750 (ANL/CMT/CP–84720) **Alteration of spent fuel matrix under unsaturated water conditions.** Finn, P.A.; Bates, J.K.; Buck, E.C.; Wronkiewicz, D.J.; Hoh, J.C.; Wolf, S.F. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950570–28: International high-level radioactive waste management conference: progress toward understanding, Las Vegas, NV (United States), 1-5 May 1995). Order Number DE95013433. Source: OSTI; NTIS; INIS; GPO Dep.

Drip tests which simulate the unsaturated conditions expected in the potential repository at Yucca Mountain are in progress to evaluate the long-term performance of spent fuel. This paper examines the corrosion behavior of the spent fuel matrix under conditions in which water is introduced at a rate of 1.5 mL every 7 days. Our recent results suggest a rapid reaction rate of the spent fuel matrix, the formation of alteration products that are similar to the sequence found in ore deposits in uranium mines, and the presence of colloidal species in the leachate. These results are compared to results from two models developed for a potential repository in an unsaturated zone.

20751 (ANL/CMT/CP–84882) **Reactivity of high plutonium-containing glasses for the immobilization of surplus fissile materials.** Bates, J.K.; Hoh, J.C.; Emery, J.W.; Buck, E.C.; Fortner, J.A.; Wolf, S.F.; Johnson, T.R. Argonne National Lab., Idaho Falls, ID (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950570–31: International high-level radioactive waste management conference: progress toward understanding, Las Vegas, NV (United States), 1-5 May 1995). Order Number DE95013472. Source: OSTI; NTIS; INIS; GPO Dep.

Experiments have been performed on glasses doped with 2 and 7 wt % plutonium to evaluate factors that may be important in the performance of these high-Pu-loaded glasses for repository storage. The high Pu loadings result from the need to dispose of excess Pu from weapons dismantling. The glasses were reacted in water vapor to simulate aging that may occur under unsaturated storage conditions prior to contact with liquid water. They were also reacted with liquid water under standard static leach test conditions. The results were compared with similar tests of a reference glass (202 glass) containing only 0.01 wt % Pu. In vapor hydration testing to date, at 2 wt % loading, the Pu was incorporated into the glass without phase separation, and reaction in water vapor proceeded at a rate comparable with that of the 202 glass. At wt % loading, a Pu phase separated and was not uniformly incorporated into the glass. The vapor reaction of this glass proceeded at a more rapid rate. This phase separation was manifested in the static leach tests, where colloidal phases of Pu-rich material remained suspended in solution, thereby increasing the absolute Pu release when compared to the 202 glass.

20752 (ANL/CMT/CP–85474) **Thermal oxidation vitrification flue gas elimination system.** Kephart, W. (Foster-Wheeler Environmental Corp., Oak Ridge, TN (United States)); Angelo, F.; Clemens, M. Argonne National Lab., IL (United States). [1995]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950542–2: 14. international symposium on thermal treatment technologies: incineration conference, Seattle, WA (United States), 8-12 May 1995). Order Number DE95013407. Source: OSTI; NTIS; INIS; GPO Dep.

With minor modifications to a Best Demonstrated Available Technology hazardous waste incinerator, it is possible to obtain combustion without potentially toxic emissions by using technology currently employed in similar applications throughout industry. Further, these same modifications will reduce waste handling over an extended operating envelope while minimizing energy consumption. Three by-products are produced: industrial grade carbon dioxide, nitrogen, and a final waste form that will exceed Toxicity Characteristics Leaching Procedures requirements and satisfy nuclear waste product consistency tests. The proposed system utilizes oxygen rather than air as an oxidant to reduce the quantities of total emissions, improve the efficiency of the oxidation reactions, and minimize the generation of toxic NO_x emissions. Not only will less potentially hazardous constituents be generated; all toxic substances can be contained and the primary emission, carbon dioxide – the leading "greenhouse gas" contributing to global warming – will be converted to an industrial by-product needed to enhance the extraction of energy feedstocks from maturing wells. Clearly, the proposed configuration conforms to the provisions for Most Achievable Control Technology as defined and mandated for the private sector by the Clear Air Act Amendments of 1990 to be implemented in 1997 and still lacking definition.

20753 (ANL/CMT/CP–85710) **Vitrification of low-level radioactive mixed waste at Argonne National Laboratory.** Mazer, J.J.; Rosine, S.D.; No, H.J. Argonne National Lab., IL (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950216–137: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95012217. Source: OSTI; NTIS; INIS; GPO Dep.

Argonne National Laboratory-East (ANL-E) is proceeding with plans to use vitrification to treat low-level radioactive mixed wastes (LLMW) generated on-site. The objective is to install a full-scale vitrification system at ANL-E capable of processing the entire annual generation of selected LLMW streams. Crucible glass studies with actual mixed waste streams have produced sodium borosilicate glasses under conditions achievable in commercially available melters. These same glass compositions, spiked with toxic metals above the expected levels in actual wastes, pass the Toxicity Characteristic Leaching Procedure (TCLP) test. Earlier evaluations of the likely off-gases that will result from vitrification indicated that the primary off-gases will include compounds of SO_x, NO_x, and CO_2. These evaluations are being experimentally confirmed with a mass spectrometer analysis of the gases evolved from samples of the ANL-E wastes. The composition of the melter feed can be adjusted to minimize volatilization of some components, if necessary. The full-scale melter will be designed to handle the annual generation of at least three LLMW waste streams: evaporator concentrator bottoms sludge (ECB), storage tank sludge (STS), and HEPA filter media. Each waste stream is mixed waste by virtue of its failure to pass the TCLP test with respect to toxic metal leaching. Additional LLMW streams under consideration for vitrification include historical mixed waste glass from past operations and spent abrasive from a planned decontamination facility.

20754 (ANL/EA/CP–84132) **Computer-aided waste management strategic planning and analysis.** Avci, H.I.; Kotek, T.J.; Koebnick, B.L. Argonne National Lab., IL (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950216–140: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95012466. Source: OSTI; NTIS; INIS; GPO Dep.

A computational model called WASTE-MGMT has been developed to assist in the evaluation of alternative waste management approaches in a complex setting involving multiple sites, waste streams, and processing options. The model provides the quantities and characteristics of wastes processed at any facility or shipped between any two sites as well as environmental emissions at any facility within the waste management system. The model input is defined by three types of fundamental waste management data: (1) waste inventories and characteristics at the point of generation; (2) treatment, storage, and disposal facility characteristics; and (3) definitions of alternative management approaches. The model has been successfully used in the preparation of the US Department of Energy (DOE) Environmental Management Programmatic.Environmental Impact Statement (EM PEIS). Certain improvements are either being implemented or planned that would extend the usefulness and applicability of the WASTE-MGMT model beyond the EM PEIS and info the. strategic planning for management of wastes under the responsibility of DOE or other agencies.

20755 (ANL/EA/CP–84317) **Facility accident analysis for low-level waste management alternatives in the US Department of Energy Waste Management Program.** Roglans-Ribas, J.; Mueller, C.; Nabelssi, B.; Folga, S.; Tompkins, M. Argonne National Lab., IL (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950216–143: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95012287. Source: OSTI; NTIS; INIS; GPO Dep.

The risk to human health of potential radiological releases resulting from facility accidents constitutes an important consideration in the US Department of Energy (DOE) waste management program. The DOE Office of Environmental Management (EM) is currently preparing a Programmatic Environmental Impact Statement (PEIS) that evaluates the risks associated with managing five types of radiological and chemical wastes in the DOE complex. Several alternatives for managing each of the five waste types are defined and compared in the EM PEIS. The alternatives cover a variety of options for storing, treating, and disposing of the wastes. Several treatment methods and operation locations are evaluated as part of the alternatives. The risk induced by potential facility accidents is evaluated for storage operations (current and projected waste storage and post-treatment storage) and for waste treatment facilities. For some of the five waste types considered, facility accidents cover both radiological and chemical releases. This paper summarizes the facility accident analysis that was performed for low-level (radioactive) waste (LLW). As defined in the EM PEIS, LLW includes all radioactive waste not classified as high-level, transuranic, or spent nuclear fuel. LLW that is also contaminated with chemically hazardous components is treated separately as low-level mixed waste (LLMW).

20756 (ANL/EA/CP–84357) **Characterization of hazardous waste residuals from Environmental Restoration Program activities at DOE installations: Waste management implications.** Lazaro, M.A.; Esposito, M.P. Argonne National Lab., IL (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950216–146: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95012939. Source: OSTI; NTIS; INIS; GPO Dep.

Investigators at Argonne National Laboratory (ANL), with support from associates at the Pacific Northwest Laboratory (PNL), have assembled an inventory of the types and volumes of radioactive, toxic or hazardous, and mixed waste likely to be generated over the next 30 years as the US Department of Energy (DOE) implements its nationwide Environmental Restoration (ER) Program. The inventory and related analyses are being considered for integration into DOE's Programmatic Environmental Impact Statement (PEIS) covering the potential environmental impacts and risks associated with alternative management practices and programs for wastes generated from routine operations. If this happens, the ER-generated waste could be managed under a set of alternatives considered under the PEIS and selected at the end of the current National Environmental Policy Act process.

20757 (ANL/EA/CP–85519) **Calculation of projected waste loads for transuranic waste management alternatives.** Hong, K.; Kotek, T.; Koebnick, B.; Wang, Y.; Kaicher, C. Argonne National Lab., IL (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950216–145: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95012938. Source: OSTI; NTIS; INIS; GPO Dep.

The level of treatment and the treatment and interim storage site configurations (decentralized, regional, or centralized) impact transuranic (TRU) waste loads at and en route to sites in the US Department of Energy (DOE) complex. Other elements that impact waste loads are the volume and characteristics of the waste and the unit operation parameters of the technologies used to treat it. Projected annual complexwide TRU waste loads under various TRU waste management alternatives were calculated using the WASTE_MGMT computational model. WASTE_MGMT accepts as input three types of data: (1) the waste stream inventory volume, mass, and contaminant characteristics by generating site and waste stream category; (2) unit operation parameters of treatment technologies; and (3) waste management alternative definitions. Results indicate that the designed capacity of the Waste Isolation Pilot Plant, identified under all waste management alternatives as the permanent disposal facility for DOE-generated TRU waste, is sufficient for the projected complexwide TRU waste load under any of the alternatives.

20758 (ANL/EA/SUMM–84815) **Environmental evaluations in the Multi-Purpose Canister Environmental Impact Statement.** Parker, G. (USDOE, Washington, DC (United States)); Kim, D.; Marmer, G.; LaGory, K. Argonne National Lab., IL (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95013386. Source: OSTI; NTIS; INIS; GPO Dep.

Short communication. CONTAINERS/design; WASTE TRANSPORTATION/environmental impacts; SPENT FUEL STORAGE/environmental impacts; ENVIRONMENTAL IMPACT STATEMENTS; CONTAINERS; DESIGN; LAND USE; AIR QUALITY; OCCUPATIONAL SAFETY; SOCIO-ECONOMIC FACTORS

20759 (ANL/RA/SUMM–85653) **Performance assessment modeling of high level nuclear wasteforms from the pyroprocess fuel cycle.** Nutt, W.M. (Argonne National Lab., IL (United States)); Hill, R.N.; Bullen, D.B. Argonne National Lab., IL (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950570–30: International high-level radioactive waste management conference: progress toward understanding, Las Vegas, NV (United States), 1-5 May 1995). Order Number DE95013470. Source: OSTI; NTIS; INIS; GPO Dep.

Several performance assessment (PA) analyses have been completed to estimate the release to the accessible environment of radionuclides from spent light water reactor (LWR) fuel emplaced in the proposed Yucca Mountain repository. Probabilistic methods were utilized based on the complexity of the repository system. Recent investigations have been conducted to identify the merits of a pyroprocess fuel cycle. This cycle utilizes high temperature molten salts and metals to partially separate actinides and fission products. In a closed liquid metal reactor (LMR) fuel cycle, this allows recycling of nearly all of the actinides. In a once-through cycle, this isolates the actinides for storage into a wasteform which can be specifically tailored for their retention. With appropriate front-end treatment, this Process can also be used to treat LWR spent fuel.

20760 (ANL/RE/CP–85929) **Sloshing analysis of viscous liquid storage tanks.** Uras, R.Z. Argonne National Lab., IL (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950740–63: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95014221. Source: OSTI; NTIS; INIS; GPO Dep.

The effect of viscosity on the sloshing response of tanks containing viscous liquids is studied using the in-house finite element

computer code, FLUSTR-ANL. Two different tank sizes each filled at two levels, are modeled, and their dynamic responses under harmonic and seismic ground motions are simulated. The results are presented in terms of the wave height, and pressures at selected nodes and elements in the finite element mesh. The viscosity manifests itself as a damping effect, reducing the amplitudes. Under harmonic excitation, the dynamic response reaches the steady-state faster as the viscosity value becomes larger. The fundamental sloshing frequency for each study case stays virtually unaffected by an increase in viscosity. For the small tank case, a 5% difference is observed in the fundamental frequency of the smallest (1 cP) and the highest (1000 cP) viscosity cases considered in this study. The fundamental frequencies of the large tank are even less sensitive.

20761 (ANL/RE/CP–85952) **Sloshing impact in roofed tanks.** Uras, R.A. Argonne National Lab., IL (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950740–64: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95014219. Source: OSTI; NTIS; INIS; GPO Dep.

A large number of high-level waste (HLW) storage tanks exists in various tank farms. Seismic activities at those locations may cause significant sloshing in HLW tanks. These tanks are covered to avoid any spilling during large amplitude earthquakes. However, large amplitude sloshing may result in impact on the cover or the roof of the tank. Hence, a better understanding of the impact phenomenon is necessary to assess the safety of the tanks currently in existence, and to establish design guidelines for future designs. A pressure based formulation is derived to model sloshing impact in roared tanks. It is incorporated into Argonne's in-house finite element code FLUSTR-ANL. A numerical test case with a harmonic input excitation is studied. The simulation results indicate that linear behavior is preserved beyond the first impact, and some mesh distortion is observed following a stronger second impact. During the impact, the displacement of the contacting surface nodes remains constant, and the velocities are reduced to zero. An identification of impacting nodes is possible from the dynamic pressures induced in surface elements.

20762 (ANL/TD/CP–82910) **Spent fuel pyroprocessing demonstration.** McFarlane, L.F.; Lineberry, M.J. Argonne National Lab., Idaho Falls, ID (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950311–1: International conference on fuel management and handling, Edinburgh (United Kingdom), 20-22 Mar 1995). Order Number DE95011957. Source: OSTI; NTIS; INIS; GPO Dep.

A major element of the shutdown of the US liquid metal reactor development program is managing the sodium-bonded spent metallic fuel from the Experimental Breeder Reactor-II to meet US environmental laws. Argonne National Laboratory has refurbished and equipped an existing hot cell facility for treating the spent fuel by a high-temperature electrochemical process commonly called pyroprocessing. Four products will be produced for storage and disposal. Two high-level waste forms will be produced and qualified for disposal of the fission and activation products. Uranium and transuranium alloys will be produced for storage pending a decision by the US Department of Energy on the fate of its plutonium and enriched uranium. Together these activities will demonstrate a unique electrochemical treatment technology for spent nuclear fuel. This technology potentially has significant economic and technical advantages over either conventional reprocessing or direct disposal as a high-level waste option.

20763 (ANL/TD/CP–86243) **A FIDAP and an empirical estimate of conjugate heat transfer of a graphite crucible.** Bateman, K.J.; Clarksean, R.L. Argonne National Lab., Idaho Falls, ID (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9504145–2: Fluid dynamics international (FIDAP) users conference, Chicago, IL (United States), 30 Apr - 2 may 1995). Order Number DE95011850. Source: OSTI; NTIS; GPO Dep.

A set of thermal analyses has been conducted to conservatively predict the heat transfer of a graphite crucible. The study used conjugate heat transfer to determine the cooling characteristics of a graphite crucible. Natural convection and conduction through the casting charge and the graphite crucible are examined. All of the analyses were conducted in non-dimensional form up to a Rayleigh number of 1×10^8. The parametric study examined the effect of increasing the internal heat generation of the casting charge. Data derived from an empirical estimate are compared to the FIDAP simulations. The two models are found to have good correlation.

20764 (BNL–52468) **Release of radon contaminants from Yucca Mountain: The role of buoyancy driven flow.** Sullivan, T.M.; Pescatore, C. Brookhaven National Lab., Upton, NY (United States). Feb 1994. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95011521. Source: OSTI; NTIS; INIS; GPO Dep.

The potential for the repository heat source to promote buoyancy driven flow and thereby cause release of radon gas out of Yucca Mountain has been examined through a critical review of the theoretical and experimental studies of this process. The review indicates that steady-state buoyancy enhanced release of natural radon and other contaminant gases should not be a major concern at Yucca Mountain. Barometric pumping and wind pumping are identified as two processes that will have a potentially greater effect on surface releases of gases.

20765 (BNL–52469) **Overview of research and development in subsurface fate and transport modeling.** Sullivan, T.M. (Brookhaven National Lab., Upton, NY (United States)); Chehata, M. Brookhaven National Lab., Upton, NY (United States). May 1995. 95p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95012459. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy is responsible for the remediation of over 450 different subsurface-contaminated sites. Contaminant plumes at these sites range in volume from several to millions of cubic yards. The concentration of contaminants also ranges over several orders of magnitude. Contaminants include hazardous wastes such as heavy metals and organic chemicals, radioactive waste including tritium, uranium, and thorium, and mixed waste, which is a combination of hazardous and radioactive wastes. The physical form of the contaminants includes solutes, nonaqueous phase liquids (NAPLs), and vapor phase contaminants such as volatilized organic chemicals and radon. The subject of contaminant fate and transport modeling is multi-disciplinary, involving hydrology, geology, microbiology, chemistry, applied mathematics, computer science, and other areas of expertise. It is an issue of great significance in the United States and around the world. As such, many organizations have substantial programs in this area. In gathering data to prepare this report, a survey was performed of research and development work that is funded by US government agencies to improve the understanding and mechanistic modeling of processes that control contaminant movement through subsurface systems. Government agencies which fund programs that contain fate and transport modeling components include the Environmental Protection Agency, Nuclear Regulatory Commission, Department of Agriculture, Department of Energy, National Science Foundation, Department of Defense, United States Geological Survey, and National Institutes of Health.

20766 (BNL–61648) **An overview of the DOE high-level waste storage tank structural integrity assessment guidelines.** Bandyopadhyay, K.; Bush, S.; Kassir, M.; Mather, B.; Shewmon, P.; Streicher, M.; Thompson, B.; van Rooyen, D.; Weeks, J. Brookhaven National Lab., Upton, NY (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950740–38: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95010449. Source: OSTI; NTIS; INIS; GPO Dep.

The basic elements of a structural integrity program for high-level waste storage tanks include identifying significant aging degradation mechanisms, developing programs to monitor and control these degradation processes, and developing management options and procedures to minimize impact on the environment should tank leakage develop. A Waste Tank Structural Integrity Panel (TSIP) was established by Brookhaven National Laboratory at the request

of the DOE Office of Environmental Restoration and Waste Management to review these elements and prepare a set of guidelines that could be used by DOE and its contractors to manage the structural integrity of these tanks. These guidelines emphasize the identification of significant degradation mechanisms for both the steel and concrete components of the tanks, the recommended monitoring and inspection programs, and the indicated management options.

20767 (BNL–61651) **Aging mechanisms for concrete components of High-Level Waste storage tanks.** Kassir, M.; Bandyopadhyay, K.; Bush, S.; Mather, B.; Shewmon, P.; Streicher, M.; Thompson, B.; van Rooyen, D.; Weeks, J. Brookhaven National Lab., Upton, NY (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950740–34: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95011403. Source: OSTI; NTIS; INIS; GPO Dep.

The age-related degradation mechanisms which affect the concrete and the reinforcing steel in the high-level waste (HLW) storage tanks art evaluated with respect to their potential significance to the continued performance of the concrete, and am classified into non-significant and potentially significant. The identified potentially significant degradation mechanisms include the effects of elevated temperature, freezing and thawing, leaching of calcium hydroxide, aggressive chemical attack, and corrosion of the reinforcing steel. To the extent that available knowledge permits, these mechanisms are generically evaluated and quantified so that site-specific plans may be developed to verify whether significant degradation has occurred in the concrete, and, if so, to formulate mitigating measures to avoid further deterioration and possibly repair the degradation or pursue other management options.

20768 (CAO–94-1005-Rev.1-Vol.1) **Waste Isolation Pilot Plant Transuranic Waste Baseline Inventory report. Volume 1. Revision 1.** Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div.; USDOE Carlsbad Area Office, NM (United States). Feb 1995. 144p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Order Number DE95009611. Source: OSTI; NTIS; INIS; GPO Dep.

Report includes diskette designed to run on IBM PC or compatible equipment.

This document provides baseline inventories of transuranic wastes for the WIPP facility. Information on waste forms, forecasting of future inventories, and waste stream originators is also provided. A diskette is provided which contains the inventory database.

20769 (CEA-CONF–12006) **Incineration as a radioactive waste volume reduction process for CEA nuclear centers.** Atabek, R.; Chaudon, L. CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Dept. d'Exploitation du Retraitement et de Demantelement. 1994. 10p. (CONF-940528–: 13. international symposium on thermal treatment technologies, Houston, TX (United States), 9-13 May 1994). Order Number DE95631534. Source: OSTI; NTIS (US Sales Only); INIS.

Incineration processes represent a promising solution for waste volume reduction, and will be increasingly used in the future. The features and performance specifications of low-level waste incinerators with capacities ranging from 10 to 20 $kg^{-}h^{-1}$ at the Fontenay-aux-Roses, Grenoble and Cadarache nuclear centers in France are briefly reviewed. More extensive knowledge of low-level wastes produced in facilities operated by the Commissariat a l'Energie Atomique (CEA) has allowed us to assess the volume reduction obtained by processing combustible waste in existing incinerators. Research and development work is in progress to improve management procedures for higher-level waste and to build facilities capable of incinerating α - contaminated waste. (authors). 6 refs., 5 figs., 1 tab.

20770 (CEA-CONF–12007) **Vitrification of reactor wastes.** Jouan, A. (CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Dept. des Procedes de Retraitement); Sussmilch, J. CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Dept. des Procedes de Retraitement. 1993. 5p. (CONF-930906–: '93 international conference on nuclear waste management and environmental remediation, Prague (Czech Republic), 5-11 Sep 1993). Order Number DE95632473. Source: OSTI; NTIS (US Sales Only); INIS.

The vitrification of low and intermediate level wastes from the NPP operation has been studied in the frame of a Franco-Czech agreement. The laboratory experiments concentrated on a search for a suitable borosilicate glass matrix which could incorporate relatively high quantities of boron and sodium, main components of liquid wastes from the WWER reactor type NPPs. A relatively wide area of waste compositions has been studied and properties of glasses suitable for the technology and waste disposal were measured. Great attention has been paid to the chemical stability (leachability), other properties like thermal dependence of viscosity and electrical conductivity of melts, and the microstructure of the final solidification product have also been evaluated. The feasibility of the vitrification process has been proved during pilot plant tests which were accomplished at the French establishment in Marcoule. The results of tests were promising. (authors). 4 tabs., 7 figs.

20771 (CONF-950209–11) **Use of passive alpha detectors to screen for uranium contamination in a field at Fernald, Ohio.** Dudney, C.S. (Oak Ridge National Lab., TN (United States)); Meyer, K.E.; Gammage, R.B.; Wheeler, R.V.; Salasky, M.; Kotrappa, P. Oak Ridge National Lab., TN (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 4. international symposium on field screening methods for hazardous wastes and toxic chemicals; Las Vegas, NV (United States); 22-24 Feb 1995. Order Number DE95013353. Source: OSTI; NTIS; INIS; GPO Dep.

TTP/OR158102.

This paper reports the results from a field test of newly developed techniques for inexpensive, in situ screening of soil for alpha contamination. Passive alpha detectors that are commercially available for the detection indoor airborne alpha activity (i.e., ^{222}Rn) have been modified so they can be applied to the detection of alpha contamination on surfaces or in soils. Results reported here are from an intercomparison involving several different techniques with all measurements being made at the same sites in a field near the formerly used uranium processing facility at Fernald, Ohio, during the summer of 1994. The results for two types of passive alpha detector show that the quality of calibration is improved if soils samples are milled to increase homogeneity within the soil matrices. The correlation between laboratory based radiochemical analyses and quick, field-based screening measurements is acceptable and can be improved if the passive devices are left for longer exposure times in the field. The total cost per measurement for either type of passive alpha detector is probably less than $25 and should provide a cost-effective means for site managers to develop the information needed to find areas with remaining alpha contamination so resources can be allocated efficiently.

20772 (CONF-950570–25) **Mined Geologic Disposal System Concept of Operations.** Heidt, R.M. TRW Environmental Safety Systems, Inc., Las Vegas, NV (United States). 8 Jun 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC01-91RW00134. From International high-level radioactive waste management conference: progress toward understanding; Las Vegas, NV (United States); 1-5 May 1995. Order Number DE95012255. Source: OSTI; NTIS; INIS; GPO Dep.

A Concept of Operations has been developed for the disposal of high-level radioactive waste in the potential geologic repository at Yucca Mountain. The Concept of Operations has been developed to document a cormion understanding of how the repository is to be operated. It is based on the repository architecture identified in the Initial Summary Report for Repository/Waste Package Advanced Conceptual Design and describes the operation of the repository from the initial receipt of waste through repository closure. Also described are operations for waste retrieval.

20773 (CONF-950646–18) **Cementitious stabilization of chromium, arsenic, and selenium in a cooling tower sludge.** Spence, R.D. (Oak Ridge National Lab., TN (United States). Chemical Technology Div.); Gilliam, T.M.; Bleier, A. Oak Ridge National Lab., TN (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Air and Waste Management Association

meeting; San Antonio, TX (United States); 18-23 Jun 1995. Order Number DE95012892. Source: OSTI; NTIS; INIS; GPO Dep.

The Federal Facility Compliance Agreement (FFCA) establishes an aggressive schedule for conducting studies and treatment method development under the treatability exclusion of RCRA for those mixed wastes for which treatment methods and capabilities have yet to be defined. One of these wastes is a radioactive cooling tower sludge. This paper presents some results of a treatability study of the stabilization of this cooling tower sludge in cementitious waste forms. The sample of the cooling tower sludge obtained for this study was found to be not characteristically hazardous in regard to arsenic, barium, chromium, lead, and selenium, despite the waste codes associated with this waste. However, the scope of this study included spiking three RCRA metals to two orders of magnitude above the initial concentration to test the limits of cementitious stabilization. Chromium and arsenic were spiked at concentrations of 200, 2,000, and 20,000 mg/kg, and selenium was spiked at 100, 1,000, and 10,000 mg/kg (concentrations based on the metal in the sludge solids). Portland cement, Class F fly ash, and slag were selected as stabilizing agents in the present study. Perlite, a fine, porous volcanic rock commonly used as a filter aid, was used as a water-sorptive agent in this study in order to control bleed water for high water contents. The highly porous perlite dust absorbs large amounts of water by capillary action and does not present the handling and processing problems exhibited by clays used for bleed water control.

20774 (CONF-950646–21) **Chemical oxidation of volatile and semi-volatile organic compounds in soil.** Gates, D.D.; Siegrist, R.L.; Cline, S.R. Oak Ridge National Lab., TN (United States). [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Air and Waste Management Association meeting; San Antonio, TX (United States); 18-23 Jun 1995. Order Number DE95013048. Source: OSTI; NTIS; INIS; GPO Dep.

Subsurface contamination with fuel hydrocarbons or chlorinated hydrocarbons is prevalent throughout the Department of Energy (DOE) complex and in many sites managed by the Environmental Protection Agency (EPA) Superfund program. The most commonly reported chlorinated hydrocarbons (occurring > 50% of DOE contaminated sites) were trichloroethylene (TCE), 1, 1, 1,-trichloroethane (TCA), and tetrachloroethylene (PCE) with concentrations in the range of 0.2 μg/kg to 12,000 mg/kg. The fuel hydrocarbons most frequently reported as being present at DOE sites include aromatic compounds and polyaromatic compounds such as phenanthrene, pyrene, and naphthalene. The primary sources of these semi-volatile organic compounds (SVOCs) are coal waste from coal fired electric power plants used at many of these facilities in the past and gasoline spills and leaks. Dense non-aqueous phase liquids (DNAPLs) can migrate within the subsurface for long periods of time along a variety of pathways including fractures, macropores, and micropores. Diffusion of contaminants in the non-aqueous, aqueous, and vapor phase can occur from the fractures and macropores into the matrix of fine-textured media. As a result of these contamination processes, removal of contaminants from the subsurface and the delivery of treatment agents into and throughout contaminated regions are often hindered, making rapid and extensive remediation difficult.

20775 (CONF-950917–9) **Risk-based cleanup and recycling of residuals from United States Department of Energy Decontamination and Decommissioning facilities in Oak Ridge, Tennessee, USA.** DeLozier, F. Martin Marietta Energy Systems, Inc., Oak Ridge, TN (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 5. international conference on radioactive waste management and environmental remediation; Berlin (Germany); 3-9 Sep 1995. Order Number DE95010222. Source: OSTI; NTIS; INIS; GPO Dep.

Decontamination and Decommissioning Program activities at United States Department of Energy facilities in Oak Ridge, Tennessee, involve a wide variety of buildings, building materials, and contaminants. There are approximately 100 buildings/structures included in the program, and they are primarily large gaseous diffusion plant buildings (one of which is 170,000 m^2 under roof), several research reactors, chemical and isotope processing facilities, and weapons component production facilities. The major contaminants at these facilities are uranium, mercury, solvents, cesium, strontium, asbestos, polychlorinated biphenyls, and other metals and radionuclides. Many of the buildings assigned to the Decontamination and Decommissioning Program are located on or near contaminated land units that are regulated under the Comprehensive Environmental Response, Compensation, and Liability Act, which prescribes risk-based cleanup. Original decontamination and decommissioning plans assumed free release standards similar to those proposed for power reactors by the United States Nuclear Regulatory Commission. However, now it is being proposed that decontamination and decommissioning work, like other remedial action work at the facilities, be governed by the Comprehensive Environmental Response, Compensation, and Liability Act-based regulatory agreement in place between the Department of Energy, the United States Environmental Protection Agency, and state regulators. It is also proposed that the facilities be cleaned up to a level dictated by the results of health and environmental-based risk assessments and consistent with the land beneath and around the buildings. The major emphasis, with all decontamination and decommissioning work, has been, and will continue to be, placed on recycling metal and other building materials when feasible.

20776 (DOE/AL/62350–151) **Integrated Project Management System description.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Sep 1994. 139p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95009832. Source: OSTI; NTIS; INIS; GPO Dep.

The Integrated Program Management System (IPMS) Description is a "working" document that describes the work processes of the Uranium Mill Tailings Remedial Action Project Office (UMTRA) and IPMS Group. This document has undergone many revisions since the UMTRA Project began; this revision not only updates the work processes but more clearly explains the relationships between the Project Office, contractors, and other participants. The work process flow style has been revised to better describe Project work and the relationships of participants. For each work process, more background and guidance on "why" and "what is expected" is given. For example, a description of activity data sheets has been added in the work organization and the Project performance and reporting processes, as well as additional detail about the federal budget process and funding management and improved flow charts and explanations of cost and schedule management. A chapter has been added describing the Cost Reduction/Productivity Improvement Program. The Change Control Board (CCB) procedures (Appendix A) have been updated. Project critical issues meeting (PCIM) procedures have been added as Appendix B. Budget risk assessment meeting procedures have been added as Appendix C. These appendices are written to act as stand-alone documentation for each process. As the procedures are improved and updated, the documentation can be updated separately.

20777 (DOE/EA–0976) **Finding of no significant impact proposed corrective action for the Northeast Site at the Pinellas Plant in Largo, Florida.** Department of Energy, Washington, DC (United States). Div. of Electric Energy Systems. [1995]. 88p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012963. Source: OSTI; NTIS; GPO Dep.

The U.S. Department of Energy (DOE) has prepared an Environmental Assessment (EA) (DOE/EA-0976) of the proposed corrective action for the Northeast Site at the Pinellas Plant in Largo, Florida. The Northeast Site contains contaminated groundwater that would be removed, treated, and discharged to the Pinellas County Sewer System. Based on the analyses in the EA, the DOE has determined that the proposed action is not a major Federal action significantly affecting the quality of the human environment, within the meaning of the National Environmental Policy Act of 1969 (NEPA), 42 U.S.C.4321 et.seq. Therefore, the preparation of an environmental impact statement is not required and the DOE is issuing this Finding of No Significant Impact (FONSI).

20778 (DOE/EA–0977) **Proposed Actinide Source-Term Waste Test Program, Los Alamos National Laboratory, Los Alamos, New Mexico. Environmental assessment, Revision 7.**

USDOE Los Alamos Area Office, NM (United States). 10 Jan 1995. 59p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012238. Source: OSTI; NTIS; INIS; GPO Dep.

The Waste Isolation Pilot Plant (WIPP) is a full-scale pilot plant designed to demonstrate the feasibility of long-term management, storage, and disposal of transuranic (TRU) waste from the environment. Environmental Protection Agency (EPA) regulations for disposal systems of transuranic wastes require development of performance assessments to provide a basis for a reasonable expectation that cumulative releases to the accessible environment will not exceed the quantities specified in 40 CFR 191 Subparts 6 and C (EPA 1993). One of the major criteria established by performance assessments is an analysis that estimates the cumulative releases of radionuclides (actinides), considering the associated uncertainties, caused by all significant processes and events. The most likely scenario to cause a release of radionuclides – in this case, the actinide elements thorium through americium – is the inadvertent intrusion of drilling into the waste storage areas. This activity could allow brine, which occurs naturally in pockets in the geological formations that make up the WIPP infrastructure, to enter and contact the salt-encrusted waste containers. Brine coming into contact with the waste containers could eventually cause a breach in the container walls, allowing their actinide content to become available for transport to the accessible environment. This Environmental Assessment (EA) analyzes the proposed action of the Actinide Source-Term Waste Test Program (STTP) as a means of providing data on the behavior of actinide elements in brine to help evaluate WIPP compliance with 40 CFR 191 Subparts B and C. The STTP is designed to measure the concentrations of actinides in actual TRU waste that has been immersed in brine. The proposed action would be a two- to five-year study to measure the concentration of actinides in brine and the composition of effluent gases in the test container as a measure of brine radiolysis and other processes.

20779 (DOE/EA–1039) **Actinide solution processing at the Rocky Flats Environmental Technology Site.** USDOE Rocky Flats Office, Golden, CO (United States). Apr 1995. 97p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012962. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy (DOE) has prepared an Environmental Assessment (EA), DOE/EA-1039, for radioactive solution removal and processing at Rocky Flats Environmental Technology Site, Golden, Colorado. The proposal for solution removal and processing is in response to independent safety assessments and an agreement with the State of Colorado to remove mixed residues at Rocky Flats and reduce the risk of future accidents. Monthly public meetings were held during the scoping and preparation of the EA. The scope of the EA included evaluations of alternative methods and locations of solution processing. A comment period from February 20, 1995 through March 21, 1995 was provided to the public and the State of Colorado to offer written comment on the EA. Comments were received from the State of Colorado and the U.S. Environmental Protection Agency. A response to the agency comments is included in the Final EA.

20780 (DOE/HWP–153) **Chemometrics review for chemical sensor development, task 7 report.** Oak Ridge National Lab., TN (United States); Advanced Sciences, Inc., Albuquerque, NM (United States). May 1994. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95014025. Source: OSTI; NTIS; INIS; GPO Dep.

This report, the seventh in a series on the evaluation of several chemical sensors for use in the U.S. Department of Energy's (DOE's) site characterization and monitoring programs, concentrates on the potential use of chemometrics techniques in analysis of sensor data. Chemometrics is the chemical discipline that uses mathematical, statistical, and other methods that employ formal logic to: design or select optimal measurement procedures and experiments and provide maximum relevant chemical information by analyzing chemical data. The report emphasizes the latter aspect. In a formal sense, two distinct phases are in chemometrics applications to analytical chemistry problems: (1) the exploratory data analysis phase and (2) the calibration and prediction phase. For use in real-world problems, it is wise to add a third aspect - the independent validation and verification phase. In practical applications, such as the ERWM work, and in order of decreasing difficulties, the most difficult tasks in chemometrics are: establishing the necessary infrastructure (to manage sampling records, data handling, and data storage and related aspects), exploring data analysis, and solving calibration problems, especially for nonlinear models. Chemometrics techniques are different for what are called zeroth-, first-, and second-order systems, and the details depend on the form of the assumed functional relationship between the measured response and the concentrations of components in mixtures. In general, linear relationships can be handled relatively easily, but nonlinear relationships can be difficult.

20781 (DOE/OR/21921–T2) **Grout for closure of the demonstration vault at the US DOE Hanford Facility. Final report.** Wakeley, L.D.; Ernzen, J.J. Army Engineer Waterways Experiment Station, Vicksburg, MS (United States). Structures Lab. Aug 1992. 153p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI05-90OR21921. (SL–92-21). Order Number DE95011452. Source: OSTI; NTIS; INIS; GPO Dep.

The Waterways Experiment Station (WES) developed a grout to be used as a cold- (nonradioactive) cap or void-fill grout between the solidified low-level waste and the cover blocks of a demonstration vault for disposal of phosphate-sulfate waste (PSW) at the US Department of Energy (DOE) Hanford Facility. The project consisted of formulation and evaluation of candidate grouts and selection of the best candidate grout, followed by a physical scale-model test to verify grout performance under project-specific conditions. Further, the project provided data to verify numerical models (accomplished elsewhere) of stresses and isotherms inside the Hanford demonstration vault. Evaluation of unhardened grout included obtaining data on segregation, bleeding, flow, and working time. For hardened grout, strength, volume stability, temperature rise, and chemical compatibility with surrogate wasteform grout were examined. The grout was formulated to accommodate unique environmental boundary conditions (vault temperature = 45 C) and exacting regulatory requirements (mandating less than 0.1% shrinkage with no expansion and no bleeding); and to remain pumpable for a minimum of 2 hr. A grout consisting of API Class H oil-well cement, an ASTM C 618 Class F fly ash, sodium bentonite clay, and a natural sand from the Hanford area met performance requirements in laboratory studies. It is recommended for use in the DOE Hanford demonstration PSW vault.

20782 (DOE/OSTI–3406(Suppl.4)(Add.2)) **Yucca Mountain Site Characterization Project Bibliography, July, December 1994: An update.** USDOE Office of Scientific and Technical Information, Oak Ridge, TN (United States). Mar 1995. 76p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95005302. Source: OSTI; NTIS; INIS; GPO Dep.

Following a reorganization of the Office of Civilian Radioactive Waste Management in 1990, the Yucca Mountain Project was renamed Yucca Mountain Site Charactrization Project. The title of this bibliography was also changed to Yucca Mountain Site Characterization Project Bibliography. Prior to August 5, 1988, this project was called the Nevada Nuclear Waste Storage Investigations. This bibliography contains information on this ongoing project that was added to the Department of Energy's Science and Technology Database from July 1, 1994 through December 31, 1994. The bibliography is categorized by principal project participating organization. Participant-sponsored subcontractor reports, papers, and articles are included in the sponsoring organization's list. Another section contains information about publications on the Energy Science and Technology Database that were not sponsored by the project but have some relevance to it.

20783 (DOE/RL–95-15) **1995 Report on Hanford site land disposal restrictions for mixed waste.** Black, D.G. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 252p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011574. Source: OSTI; NTIS; INIS; GPO Dep.

This report was submitted to meet the requirements of Hanford Federal Facility Agreement and Consent Order Milestone M-26-01E. This milestone requires the preparation of an annual report that covers characterization, treatment, storage, minimization, and

other aspects of land disposal restricted mixed waste at the Hanford Site. The U.S. Department of Energy, its predecessors, and contractors at the Hanford Site were involved in the production and purification of nuclear defense materials from the early 1940s to the late 1980s. These production activities have generated large quantities of liquid and solid radioactive mixed waste. This waste is subject to regulation under authority of both the Resource Conservation and Recovery Act of 1976 and Atomic Energy Act of 1954. This report covers mixed waste only. The Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy have entered into an agreement, the Hanford Federal Facility Agreement and Consent Order (commonly referred to as the Tri-Party Agreement) to bring the Hanford Site operations into compliance with dangerous waste regulations. The Tri-Party Agreement required development of the original land disposal restrictions (LDRs) plan and its annual updates to comply with LDR requirements for radioactive mixed waste. This report is the fifth update of the plan first issued in 1990. Tri-Party Agreement negotiations completed in 1993 and approved in January 1994 changed and added many new milestones. Most of the changes were related to the Tank Waste Remediation System and these changes are incorporated into this report.

20784 (DOE/RL–364162-1-Vol.4) **Solid Waste Operations Complex W-113: Project cost estimate. Preliminary design report. Volume IV.** Westinghouse Hanford Co., Richland, WA (United States). Jan 1995. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Subcontract MJJ-SVV-364162. Order Number DE95010981. Source: OSTI; NTIS; INIS; GPO Dep.

This document contains Volume IV of the Preliminary Design Report for the Solid Waste Operations Complex W-113 which is the Project Cost Estimate and construction schedule. The estimate was developed based upon Title 1 material take-offs, budgetary equipment quotes and Raytheon historical in-house data. The W-113 project cost estimate and project construction schedule were integrated together to provide a resource loaded project network.

20785 (DOE/WIPP–95-1090) **Waste Isolation Pilot Plant remote-handled transuranic waste disposal strategy.** USDOE Carlsbad Area Office, NM (United States). 31 Mar 1995. 41p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012516. Source: OSTI; NTIS; INIS; GPO Dep.

The remote-handled transuranic (RH-TRU) waste disposal strategy described in this report identifies the process for ensuring that cost-effective initial disposal of RH-TRU waste will begin in Fiscal Year 2002. The strategy also provides a long-term approach for ensuring the efficient and sustained disposal of RH-TRU waste during the operating life of WIPP. Because Oak Ridge National Laboratory stores about 85 percent of the current inventory, the strategy is to assess the effectiveness of modifying their facilities to package waste, rather than constructing new facilities. In addition, the strategy involves identification of ways to prepare waste at other sites to supplement waste from Oak Ridge National Laboratory. DOE will also evaluate alternative packagings, modes of transportation, and waste emplacement configurations, and will select preferred alternatives to ensure initial disposal as scheduled. The long-term strategy provides a systemwide planning approach that will allow sustained disposal of RH-TRU waste during the operating life of WIPP. The DOE's approach is to consider the three relevant systems – the waste management system at the generator/storage sites, the transportation system, and the WIPP disposal system – and to evaluate the system components individually and in aggregate against criteria for improving system performance. To ensure full implementation, in Fiscal Years 1996 and 1997 DOE will: (1) decide whether existing facilities at Oak Ridge National Laboratory or new facilities to package and certify waste are necessary; (2) select the optimal packaging and mode of transportation for initial disposal; and (3) select an optimal disposal configuration to ensure that the allowable limits of RH-TRU waste can be disposed. These decisions will be used to identify funding requirements for the three relevant systems and schedules for implementation to ensure that the goal of initial disposal is met.

20786 (DOE/WIPP–95-2092) **Waste Isolation Pilot Plant borehole data.** Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. Apr 1995. 340p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Order Number DE95012971. Source: OSTI; NTIS; INIS; GPO Dep.

Data pertaining to all the surface boreholes used at the WIPP site for site characterization hydrological testing and resource evaluation exist in numerous source documents. This project was initiated to develop a comprehensive data base that would include the data on all WIPP related surface boreholes from the Atomic Energy Commission, Waste Isolation Pilot Plant Energy Research and Development Administration, Department of Energy, and Hydrologic Test Borehole Programs. The data compiled from each borehole includes: operator, permit number, location, total depth, type of well, driller, drilling record, casing record, plugging schedule, and stratigraphic summary. There are six groups of boreholes contained in this data base, they are as follows: Commercially Drilled Potash Boreholes, Energy Department Wells, Geologic Exploration Boreholes, Hydrologic Test Boreholes, Potash Boreholes, and Subsurface Exploration Boreholes. There were numerous references which contained borehole data. In some cases the data found in one document was inconsistent with data in another document. In order to ensure consistency and accuracy in the data base, the same references were used for as many of the boreholes as possible. For example, all elevations and locations were taken from Compilation and Comparison of Test-Hole Location Surveys in the Vicinity of the WIPP Site. SAND 88-1065, Table 3-5. There are some sections where a data field is left blank. In this case, the information was either not applicable or was unavailable.

20787 (DUN–5200-RD) **Waste management plans.** Corbit, C.D.; Geier, R.G. Douglas United Nuclear, Inc., Richland, WA (United States). 9 Dec 1968. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95012639. Source: OSTI; NTIS; GPO Dep.

Douglas United Nuclear, Inc., operates for the AEC at the Hanford reservation four production reactors and their fuel preparation facilities. The production reactor plants are located on the south bank of the Columbia River approximately 30 miles northwest of Richland. The fuel preparation plants, located about 5 miles north of Richland are also on the Columbia River. This report provides identification of such facility; a brief description of functions and environs; and schematic diagrams of processes which generate radioactive wastes. A discussion of process characteristics which determine quantity and quality of wastes is provided.

20788 (INIS-mf–15112) **Conditions governing the acceptance of radioactive wastes by the Hauptabteilung Dekontaminationsbetriebe (HDB). Full text of legal provisions, issue no.6 of July 1, 1991, as amended until January 1, 1995.** Forschungszentrum Karlsruhe GmbH Technik und Umwelt (Germany). 1995. 69p. (In German). Order Number DE95785652. Source: OSTI; NTIS (US Sales Only); INIS.

With separate price list.

The conditions apply to the acceptance of radwaste by the Main Decontamination Dept. (HDB) of Karlsruhe Research Center, including radioactive remnants, contaminated plant components, and primary waste from the following waste generators: Institutes of the Karlsruhe Research Center, facilities located within the Center but run by other organisations, other outside facilities not linked with the Center, as e.g. waste generators in Baden-Wuerttemberg obliged to deliver their radwaste to the Radwaste Collecting Site of the Land of Baden-Wuerttemberg. Amendments are marked at the right-hand margin of the text.

20789 (LA–12779-MS) **Colloid-facilitated radionuclide transport at Yucca Mountain.** Triay, I. (Los Alamos National Lab., NM (United States)); Levy, S.; Robinson, B.; Simmons, A.; Nelson, S.; Nuttall, H.; Steinkampf, W.; Viani, B. Los Alamos National Lab., NM (United States). Apr 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95010558. Source: OSTI; NTIS; GPO Dep.

The objective of this report is to describe the colloid investigations within the Yucca Mountain Site Characterization Project (YMP) to evaluate whether colloids will significantly increase radionuclide release from a potential high-level nuclear waste repository at Yucca Mountain to the accessible environment. The

evidence of the existence of colloids from sampling studies and observation of colloid transport at the field scale are reviewed. The relevance of colloid transport laboratory and field experiments to the conditions at Yucca Mountain are discussed. Research needs are identified in the areas of colloid sampling, colloid generation, colloid stability, colloidal sorption/desorption of radionuclides, and colloid migration. The colloid transport calculations that will allow evaluation of the data to assess the importance of colloid-facilitated radionuclide transport at Yucca Mountain are presented.

20790 (LA–12886-MS) **Plutonium carbonate speciation changes as measured in dilute solutions with photoacoustic spectroscopy: Yucca Mountain Site Characterization Program Milestone report 3350.** Tait, C.D.; Ekberg, S.A.; Palmer, P.D.; Morris, D.E. Los Alamos National Lab., NM (United States). May 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95012118. Source: OSTI; NTIS; INIS; GPO Dep.

The stability fields for dilute Pu-carbonate species versus pH (8.4 to 12.0) and total carbonate concentrations (3 mM to 1.0 M) have been mapped-out using photoacoustic absorption spectroscopy (PAS). At least four different plutonium species, characterized by absorption peaks at 486, 492, 500, and 513 rim, have been found. A redox change to a Pu(VI) complex can not account for the speciation change associated with the first two spectra (486 and 492 nm peaks). Moreover, the data are consistent with what is predicted from a previous YMP milestone. This previous study was performed under very different conditions of plutonium concentration and carbonate/pH changes, and extension of these conditions to much lower Pu concentrations and to more neutral pHs was made possible with PAS spectroscopy. These new results reinforce the previous results by extending the range of direct observation and by eliminating other possibilities such as dimerization/polymerization reactions. As bicarbonate concentration is increased from .01 M to 1.0 M at pH=8.4 to 8.9, predominately $[Pu(OH)_{x+1}(CO_3)_y]^{4-(x+2y)}$ (492 nm peak) is converted to $[Pu(OH)_x(CO_3)_{y+1}]^{4-(x+2y+2)}$ (486 nm peak). The starting stoichiometry (x and y values) remain undetermined, but the effect of ionic strength and temperature indicate that the 486 nm species is highly charged, and therefore $x+2y \geq 3$. The temperature effect on the equilibrium between these two species was also investigated, with the species giving rise to the 486 nm peak reversibly losing importance at elevated (50 and 75°C temperatures).

20791 (LA–12907) **Pit-storage monitoring.** Buntain, G. (and others); Matsumoto, K.; Steinke, R. Los Alamos National Lab., NM (United States). Apr 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95010559. Source: OSTI; NTIS; GPO Dep.

Plutonium Pits retrieved during the dismantlement of nuclear weapons are presently being stored in earth-covered magazines in Zone 4 at the Pantex plant in Amarillo, Texas. Delays in the development and certification of an approved long-term storage facility indicate that these pits are likely to remain at Pantex for the foreseeable future. Because these magazines are not protected by any environmental control systems and because the number of pits per magazine is high, temperatures within the magazines can, and sometimes do, rise to temperatures higher than optimum for pit storage. Scientists from Los Alamos and Lawrence Livermore national laboratories, as well as from the Pantex plant, operated by Mason & Hanger, have collaborated to design a joint modeling/experimental program that will enable scientists to understand heat-flow phenomena in pit-storage magazines. Our efforts have focused on developing the capability to predict temperatures of stored pits. We are using environmental information gathered primarily from the Pantex pit-storage facility to develop empirical predictive tools as well as three-dimensional heat-flow models.

20792 (LA–12928-MS) **In-place HEPA filter testing summary (1993).** Martinez, V.A.; Helland, G.D. Los Alamos National Lab., NM (United States). Apr 1995. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95010556. Source: OSTI; NTIS; INIS; GPO Dep.

This report is the latest in a series of annual reports regarding the in-place testing program for highly efficient filtration systems at Los Alamos National Laboratory. This testing is conducted to maintain regulatory permits and verify the performance levels of these filtration systems have not deteriorated over the last operating cycle. In-place testing is also conducted on systems when maintenance and/or repair to the filtration system have been performed to verify that the system components have been installed correctly and there has been no damage to the filter media. Performance testing of negative air pressure machines and HEPA filtered vacuums has been included as part of the decontamination and decommissioning activities and the asbestos management program at Los Alamos National Laboratory. This report provides a brief overview of the testing procedures used to conduct in-place tests, a summary of individual system performance, and trends observed since the previous year.

20793 (LA–12936-MS) **Tank SY-102 remediation project summary report: ASPEN modeling.** Punjak, W.A.; Schreiber, S.B.; Yarbro, S.L. Los Alamos National Lab., NM (United States). May 1995. 85p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95012116. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy established the Tank Waste Remediation System (TWRS) to safely manage and dispose of radioactive waste stored in underground tanks on the Hanford Site. As a part of this program, personnel at Los Alamos National Laboratory (LANL) have developed and demonstrated a flow sheet to remediate tank SY-102, which is located in the 200 West Area and contains high-level radioactive waste. In the conceptual design report issued earlier, an ASPEN plus™ computer model of the flow sheet was presented. This report documents improvements in the flow sheet model after additional thermodynamic data for the actinide species were incorporated.

20794 (LA–12943) **Effects of soluble organic complexants and their degradation products on the removal of selected radionuclides from high-level waste. Part II: Distributions of Sr, Cs, Tc, and Am onto 32 absorbers from four variations of Hanford tank 101-SY simulant solution.** Marsh, S.F. (Sandia National Labs., Albuquerque, NM (United States)); Svitra, Z.V.; Bowen, S.M. Los Alamos National Lab., NM (United States). Apr 1995. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95013479. Source: OSTI; NTIS; INIS; GPO Dep.

Many of the radioactive waste storage tanks at U.S. Department of Energy facilities contain organic compounds that have been degraded by radiolysis and chemical reactions during decades of storage. In this second part of our three-part investigation of the effects of soluble organic complexants and their degradation products, we measured the sorption of strontium, cesium, technetium, and americium onto 32 absorbers that offer high sorption of these elements in the absence of organic complexants. The four solutions tested were (1) a simulant for a 3:1 dilution of Hanford Tank 101-SY contents that initially contained ethylenediaminetetraacetic acid (EDTA), (2) this simulant after gamma-irradiation to 34 Mrads, (3) the unirradiated simulant after treatment with a hydrothermal organic-destruction process, and (4) the irradiated simulant after hydrothermal processing. For each of 512 element/absorber/solution combinations, we measured distribution coefficients (Kds) twice for each period for dynamic contact periods of 30 min, 2 h, and 6 h to obtain information about sorption kinetics. On the basis of our 3,072 measured Kd values, the sorption of strontium and americium is significantly decreased by the organic components of the simulant solutions, whereas the sorption of cesium and technetium appears unaffected by the organic components of the simulant solutions.

20795 (LA–12949-MS) **Discriminators for the Accelerator-Based Conversion (ABC) concept using a subcritical molten salt system.** Arthur, E.; Busksa, J.; Davidson, W.; Poston, D. Los Alamos National Lab., NM (United States). May 1995. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95012988. Source: OSTI; NTIS; INIS; GPO Dep.

Discriminators are described that quantify enhancements added to plutonium destruction and/or nuclear waste transmutation systems through use of an accelerator/fluid fuel combination. This

combination produces a robust and flexible nuclear system capable of the destruction of all major long-lived actinides (including plutonium) and fission products. The discriminators discussed in this report are (1) impact of subcritical operation on safety, (2) impact of subcritical and fluid fuel operation on plutonium burnout scenarios, and (3) neutron economy enhancements brought about by subcritical operation. Neutron economy enhancements are quantified through assessment of long-term dose reduction resulting from transmutation of key fission products along with relaxation of processing frequencies afforded by subcritical operation.

20796 (LA-SUB–95-36-Vol.3) **Computer Applications Group Inc., Final report FY93 and FY94. Volume 3.** Los Alamos National Lab., NM (United States); Computer Applications Group, Inc., Carlton, OR (United States). 15 Dec 1994. 142p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95013478. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents data pertaining to the geologic mapping of the Yucca Mountain Exploratory Studies facility. Topics discussed include; investigation plans, investigation controls, order of performing multiple investigations, and references to the design requirements of the exploratory studies facility.

20797 (LA-SUB–95-41) **Kinetic measurements on the silicates of the Yucca Mountain potential repository. [Final report], January–September 1994.** Barnes, H.L. (Los Alamos National Lab., NM (United States)); Wilkin, R.T. Los Alamos National Lab., NM (United States); Pennsylvania State Univ., University Park, PA (United States). 25 Aug 1994. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95012085. Source: OSTI; NTIS; INIS; GPO Dep.

The principal effort has been concentrated on the preparation of clean clinoptilolite, quartz, and boehmite and then reaction of the natural clinoptilolite solid solution to the Naendmember, plus measurements of the endmember solubility to derive an accurate equilibrium constant for the clinoptilolite dissolution reaction, correctly speciated. We are very pleased with the consistency between the best calorimetrically measured and modeled equilibrium constants and those we have determined from 125°C to 265°C. These results now provide a basis for relating measurements of reaction rates to departures from equilibrium.

20798 (LA-UR–95-252) **A process for treating uranium chips and turnings.** Dziewinska, K. (Los Alamos National Lab., NM (United States)); Lussiez, G.; Munger, D. Los Alamos National Lab., NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950917–5: 5. international conference on radioactive waste management and environmental remediation, Berlin (Germany), 3-9 Sep 1995). Order Number DE95006270. Source: OSTI; NTIS; INIS; GPO Dep.

Depleted uranium (DU) chips and turnings are generated during machining of uranium metal. Because high surface area uranium is pyrophoric, the turnings are subject to spontaneous ignition in air. The oxidation of uranium to $U0_2$ and U_30_8 is highly exothermic and therefore the reaction may be self-sustaining. A uranium fire or even rapid oxidation and thermal convection currents will cause emission of radioactive uranium oxides. In the presence of water as liquid or vapor, uranium may also oxidize into $U0_2$ and U_30_8 with generation of hydrogen, a flammable and explosive gas. The heat generated the water reaction may ignite the uranium or hydrogen producing a fire, explosion, or convection current resulting in some uranium oxide becoming airborne. Because the high surface area uranium has the hazardous characteristic of reactivity, it is stored immersed in diesel oil preventing contact with water or air. Los Alamos National Laboratory (LANL) has developed and constructed a process to remove the reactivity characteristic by oxidizing uranium metal to an inert product. This inert form can then be landfilled as a low-level waste. The treatment process consists of draining the packing oils, treating with sodium hypochlorite to wet-oxidize the DU to uranyl hydroxide ($UO_2(OH)_2$), using sodium thiosulfate to reduce the ($UO_2(OH)2$) to $U0_2$, neutralizing with sodium hydroxide, and stabilizing the settled slurry in a cement matrix. The neutralized waste water is consumed at a radioactive waste water treatment facility. Studies done at LANL describe a manageable oxidation rate well within safe bounds.

20799 (LA-UR–95-254) **A process for treating radioactive water-reactive wastes.** Dziewinski, J. (Los Alamos National Lab., NM (United States)); Lussiez, G.; Munger, D. Los Alamos National Lab., NM (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950917–4: 5. international conference on radioactive waste management and environmental remediation, Berlin (Germany), 3-9 Sep 1995). Order Number DE95006269. Source: OSTI; NTIS; INIS; GPO Dep.

Los Alamos National Laboratory and other locations in the complex of experimental and production facilities operated by the United States Department of Energy (DOE) have generated an appreciable quantity of hazardous and radioactive wastes. The Resource Conservation and Recovery Act (RCRA) enacted by the United States Congress in 1976 and subsequently amended in 1984, 1986, and 1988 requires that every hazardous waste must be rendered nonhazardous before disposal. Many of the wastes generated by the DOE complex are both hazardous and radioactive. These wastes, called mixed wastes, require applying appropriate regulations for radioactive waste disposal and the regulations under RCRA. Mixed wastes must be treated to remove the hazardous waste component before they are disposed as radioactive waste. This paper discusses the development of a treatment process for mixed wastes that exhibit the reactive hazardous characteristic. Specifically, these wastes react readily and violently with water. Wastes such as lithium hydride (LiH), sodium metal, and potassium metal are the primary wastes in this category.

20800 (LA-UR–95-255) **A process for treatment of mixed waste containing chemical plating wastes.** Anast, K.R.; Dziewinski, J.; Lussiez, G. Los Alamos National Lab., NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950917–3: 5. international conference on radioactive waste management and environmental remediation, Berlin (Germany), 3-9 Sep 1995). Order Number DE95006267. Source: OSTI; NTIS; INIS; GPO Dep.

The Waste Treatment and Minimization Group at Los Alamos National Laboratory has designed and will be constructing a transportable treatment system to treat low-level radioactive mixed waste generated during plating operations. The chemical and plating waste treatment system is composed of two modules with six submodules, which can be trucked to user sites to treat a wide variety of aqueous waste solutions. The process is designed to remove the hazardous components from the waste stream, generating chemically benign, disposable liquids and solids with low level radioactivity. The chemical and plating waste treatment system is designed as a multifunctional process capable of treating several different types of wastes. At this time, the unit has been the designated treatment process for these wastes: Destruction of free cyanide and metal-cyanide complexes from spent plating solutions; destruction of ammonia in solution from spent plating solutions; reduction of Cr^{VI} to Cr^{III} from spent plating solutions, precipitation, solids separation, and immobilization; heavy metal precipitation from spent plating solutions, solids separation, and immobilization, and acid or base neutralization from unspecified solutions.

20801 (LA-UR–95-256) **Electrochemical treatment of mixed (hazardous and radioactive) wastes.** Dziewinski, J.; Zawodzinski, C.; Smith, W.H. Los Alamos National Lab., NM (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950917–2: 5. international conference on radioactive waste management and environmental remediation, Berlin (Germany), 3-9 Sep 1995). Order Number DE95006268. Source: OSTI; NTIS; INIS; GPO Dep.

Electrochemical treatment technologies for mixed hazardous waste are currently under development at Los Alamos National Laboratory. For a mixed waste containing toxic components such as heavy metals and cyanides in addition to a radioactive component, the toxic components can be removed or destroyed by electrochemical technologies allowing for recovery of the radioactive component prior to disposal of the solution. Mixed wastes with an organic component can be treated by oxidizing the organic compound to carbon dioxide and then recovering the radioactive

component. The oxidation can be done directly at the anode or indirectly using an electron transfer mediator. This work describes the destruction of isopropanol, acetone and acetic acid at greater than 90% current efficiency using cobalt +3 or silver +2 as the electron transfer mediator. Also described is the destruction of cellulose based cheesecloth rags with electrochemically generated cobalt +3, at an overall efficiency of approximately 20%.

20802 (LA-UR–95-331) **Reclamation of greater than Class C sealed sources at the Los Alamos National Laboratory.** Behrens, R.G.; Jones, S.W. Los Alamos National Lab., NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950917–6: 5. international conference on radioactive waste management and environmental remediation, Berlin (Germany), 3-9 Sep 1995). Order Number DE95006277. Source: OSTI; NTIS; INIS; GPO Dep.

One of the important overriding themes of the Los Alamos National Laboratory as a world-class scientific institution is to utilize its expertise in enhancing the long-term welfare of society by minimizing negative side effects of nuclear technology over the past five decades. The Los Alamos National Laboratory is therefore committed to the use of its technical competencies and nuclear facilities, developed through programs in the areas of defense and civilian nuclear research, to support activities which will benefit the United States as a whole. As such, this paper discusses the organizational details and requirements of the Neutron Source Reclamation Program at Los Alamos. This program has as its mission the retrieval, interim storage, and chemical reprocessing of ^{238}PuBe, ^{239}PuBe and ^{241}AmBe neutron sources residing in the hands of private companies and industries, academic institutions, and various state and Federal government agencies.

20803 (LA-UR–95-1270) **Waste site characterization through digital analysis of historical aerial photographs at Los Alamos National Laboratory and Eglin Air Force Base.** Van Eeckhout, E.; Pope, P.; Wells, B.; Rofer, C.; Martin, B. Los Alamos National Lab., NM (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9505205–2: 5. major Range and Test Facility Base environmental workshop, Alexandria, VA (United States), 23-25 May 1995). Order Number DE95012075. Source: OSTI; NTIS; INIS; GPO Dep.

Historical aerial photographs are used to provide a physical history and preliminary mapping information for characterizing hazardous waste sites at Los Alamos National Laboratory and Eglin Air Force Base. The examples cited show how imagery was used to accurately locate and identify previous activities at a site, monitor changes that occurred over time, and document the observable of such activities today. The methodology demonstrates how historical imagery (along with any other pertinent data) can be used in the characterization of past environmental damage.

20804 (LA-UR–95-1509) **A versatile, high-power proton linac for accelerator driven transmutation technologies.** Billen, J.H.; Nath, S.; Stovall, J.E.; Takeda, H.; Wood, R.L.; Young, L.M. Los Alamos National Lab., NM (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950512–109: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95011986. Source: OSTI; NTIS; INIS; GPO Dep.

We are applying the new coupled-cavity drift-tube linac (CCDTL) to a conceptual design of a high-current, CW accelerator for transmutation applications. A 350-MHz RFQ followed by 700–MHz structures accelerates a 100-mA proton beam to I GeV. Several advantages stem from four key features: (1) a uniform focusing lattice from the start of the CCDTL at about 7 MeV to the end of the linac, (2) external location and separate mechanical support of the electromagnetic quadrupole magnets, (3) very flexible modular physics design and mechanical implementation, and (4) compact, high-frequency structures. These features help to reduce beam loss and, hence, also reduce potential radioactivation of the structure. They result in easy alignment, fast serviceability, and high beam availability. Beam funneling, if necessary, is possible at any energy after the RFQ.

20805 (LBL–36386) **Two-phase flow in regionally saturated fractured rock near excavations.** Geller, J.T. (Lawrence Berkeley Lab., CA (United States). Earth Sciences Div.); Doughty, C.; Long, J.C.S. Lawrence Berkeley Lab., CA (United States). Nov 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-950570–22: International high-level radioactive waste management conference: progress toward understanding, Las Vegas, NV (United States), 1-5 May 1995). Order Number DE95012357. Source: OSTI; NTIS; INIS; GPO Dep.

Hydrologic characterization for potential nuclear waste repositories relies upon data obtained from testing in excavations. The Simulated Drift Experiment in the Stripa Mine in Sweden, a fractured granitic formation below the water table, investigated excavation effects on hydrologic response. Measured water inflow to the drift at atmospheric pressure was nine times less than the value predicted from the inflow to boreholes with pressure held at 2.7 bars. This flow reduction may be due to dissolved gas that comes out of solution at pressures below 2.7 bars, creating a two-phase regime. To investigate this possibility, theoretical studies of flow through fractures when the water is super-saturated with respect to dissolved gas are carried out, using a simple analytical solution followed by a numerical model which relaxes some of the simplifying assumptions. Laboratory experiments that simulate degassing in transparent fracture replicas are conducted to test the assumptions used in the theoretical studies.

20806 (LBL–36872) **Applications of TOUGH2 to infiltration of liquids in media with strong heterogeneity.** Pruess, K.; Antunez, E. Lawrence Berkeley Lab., CA (United States). Feb 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9503116–7: 1995 TOUGH workshop, Berkeley, CA (United States), 20-22 Mar 1995). Order Number DE95012392. Source: OSTI; NTIS; GPO Dep.

Much hydrogeological research during the last decade has focused on the heterogeneity of natural geologic media on different scales. Most of this work has dealt with flow and transport in single-phase, isothermal conditions. The present paper is concerned with multiphase and nonisothermal flows in strongly heterogeneous media. A primary driver of our studies is the hydrogeological system at Yucca Mountain, which is currently being evaluated by the Department of Energy for its suitability as the site of the first geologic repository for civilian high-level nuclear wastes in the US Yucca Mountain is located in the and Southwest, near the Nevada-California border. Going from large scale to small, formation heterogeneities at Yucca Mountain include (i) alternating tilting layers of welded and non-welded tuffs with different matrix permeability and variable degree of fracturing, (ii) major fault systems, (iii) well-connected and permeable fracture networks in low-permeability rocks, and (iv) individual fractures with highly variable apertures.

20807 (LLNL–95012992) **Bibliography of Yucca Mountain Project (YMP) publications at Lawrence Livermore National Laboratory, September 1977–December 1994.** Lawrence Livermore National Lab., CA (United States). Jan 1995. 66p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95012992. Source: OSTI; NTIS; INIS; GPO Dep.

This report consists of a listing of research projects pertaining to the Yucca Mountain project.

20808 (NUREG/CR–6256-Vol.1) **Field lysimeter investigations - test results. Low-level waste data base development program: Test results for fiscal years 1986, 1987, 1988, and 1989.** McConnell, J.W. Jr.; Rogers, R.D.; Findlay, M.W.; Davis, E.C.; Jastrow, J.D.; Neilson, R.M. Jr.; Hilton, L.D. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications; Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). May 1995. 133p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC07-94ID13223. (INEL–95/0073-Vol.1). Source: OSTI; NTIS; GPO; INIS.

The Field Lysimeter Investigations: Low-Level Waste Data Base Development Program, funded by the U.S. Nuclear Regulatory Commission (NRC), is (a) studying the degradation effects in EPICOR-II organic ion-exchange resins caused by radiation, (b) examining the adequacy of test procedures recommended in the

Branch Technical Position on Waste Form to meet the requirements of 10 CFR 61 using solidified EPICOR-II resins, (c) obtaining performance information on solidified EPICOR-II ion-exchange resins in a disposal environment, and (d) determining the condition of EPICOR-II liners. Results of the first 4 years of data acquisition from the field testing are presented and discussed. During the continuing field testing, both Portland type I-II cement and Dow vinyl ester-styrene waste forms are being tested in lysimeter arrays located at Argonne National Laboratory-East in Illinois and at Oak Ridge National Laboratory. The experimental equipment is described and results of waste form characterization using tests recommended by the NRC's "Technical Position on Waste Form" are presented. The study is designed to provide continuous data on nuclide release and movement, as well as environmental conditions, over a 20-year period.

20809 (ORNL/ER–299) **Site characterization summary report for Waste Area Grouping 10 Wells at the Old Hydrofracture Facility, Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Oak Ridge National Lab., TN (United States); Bechtel National, Inc., Oak Ridge, TN (United States). Mar 1995. 503p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95012486. Source: OSTI; NTIS; INIS; GPO Dep.

The Oak Ridge National Laboratory (ORNL) in Oak Ridge, Tennessee, is operated for the Department of Energy (DOE) by Martin Marietta Energy Systems (Energy Systems). As part of its DOE mission, ORNL has pioneered waste disposal technologies throughout the years of site operations since World War II. In the late 1950s, efforts were made to develop a permanent disposal alternative to the surface impoundments at ORNL at the request of the National Academy of Sciences. One such technology, the hydrofracture process, involved forming fractures in an underlying geologic host formation (a low-permeability shale) at depths of up to 1000 ft and subsequently injecting a grout slurry containing low-level liquid waste, cement, and other additives at an injection pressure of about 2000 psi. The objective of the effort was to develop a grout slurry that could be injected as a liquid but would solidify after injection, thereby immobilizing the radioisotopes contained in the low-level liquid waste. The scope of this site characterization was the access, sampling, logging, and evaluation of observation wells near the Old Hydrofracture Facility (OHF) in preparation for plugging, recompletion, or other final disposition of the wells.

20810 (ORNL/TM–12105) **Update of the management strategy for Oak Ridge National Laboratory Liquid Low-Level Waste.** Robinson, S.M.; Abraham, T.J.; DePaoli, S.M.; Walker, A.B. Oak Ridge National Lab., TN (United States). Apr 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95011626. Source: OSTI; NTIS; INIS; GPO Dep.

The strategy for management of the Oak Ridge National Laboratory's (ORNL) radioactively contaminated liquid waste was reviewed in 1991. The latest information available through the end of 1990 on waste characterization, regulations, US Department of Energy (DOE) budget guidance, and research and development programs was evaluated to determine how the strategy should be revised. Few changes are needed to update the strategy to reflect new waste characterization, research, and regulatory information. However, recent budget guidance from DOE indicates that minimum funding will not be sufficient to accomplish original objectives to upgrade the liquid low-level waste (LLLW) system to comply with the Federal Facilities Agreement, provide long-term LLLW treatment capability, and minimize environmental, safety, and health risks. Options are presented that might allow the ORNL LLLW system to continue operations temporarily, but they would significantly reduce its capabilities to handle emergency situations, provide treatment for new waste streams, and accommodate waste from the Environmental Restoration Program and from decontamination and decommissioning of surplus facilities. These options are also likely to increase worker radiation exposure, risk of environmental insult, and generation of solid waste for on-site and off-site disposal/storage beyond existing facility capacities. The strategy will be fully developed after receipt of additional guidance. The proposed budget limitations are too severe to allow ORNL to meet regulatory requirements or continue operations long term.

20811 (ORNL/TM–12903) **Evaluation of improved techniques for the removal of ^{90}Sr and ^{137}Cs from process wastewater and groundwater: Chabazite zeolite baseline study.** Bostick, D.T.; Arnold, W.D. Jr.; Taylor, P.A.; McTaggart, D.R.; Burgess, M.W.; Guo, B. Oak Ridge National Lab., TN (United States). Apr 1995. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95011627. Source: OSTI; NTIS; INIS; GPO Dep.

Standard waste treatment procedures for the removal of ^{90}Sr and ^{137}Cs from contaminated groundwater and process wastewaters generate large volumes of secondary contaminated wastes. Several new sorbent materials, ion exchangers, and other processes hold the promise of treating large volumes of contaminated water while minimizing the generation of secondary low-level radioactive wastes. As part of the Efficient Separations/Processes-Integrated Program (ESPIP), these new treatment techniques will be compared with standard processes to define their effectiveness for the removal of radioactive strontium (Sr) and cesium (Cs), as well as to gauge the quantity of secondary radioactive waste generated by the new processes. This report summarizes the efforts made to design standardized testing procedures to evaluate the sorption characteristics of a baseline wastewater treatment technique. Definition of the experimental procedures, as well as a summary of the benchmark sorption technique, will provide the framework with which to compare newly evolving treatment technologies. Accomplishments include selecting the feed strewn to the Process Waste Treatment Plant (PWTP) at Oak Ridge National Laboratory as representative of the prototypical contaminated wastewater of many DOE sites. Samples from the PWTP feed stream were collected and analyzed for metals, anions, total Sr and Cs, radioactive Sr and Cs, alkalinity, pH, and density. The cumulative sample data were used to formulate a simulant that will be used as a standard waste surrogate for comparative testing of selected treatment methods.

20812 (ORNL/TM–12926) **Strategic Environmental Research and Development Project FY 1994: Assessing national remote sensing technologies for use in US Department of Energy Environmental Restoration Activities, Oak Ridge Solid Waste Storage Area 4 case study.** King, A.L.; Smyre, J.L.; Evers, T.K. Oak Ridge National Lab., TN (United States). Feb 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95008962. Source: OSTI; NTIS; INIS; GPO Dep.

During FY 1994, the Oak Ridge Environmental Restoration (ER) Remote Sensing Program teamed with members of the Oak Ridge National Security Program Office (NSPO), the Environmental Research Institute of Michigan (ERIM) under contract to the National Exploitation Laboratory (NEL), the Oak Ridge Waste Area Group 4 (WAG 4) ER Program, and the US Department of Energy (DOE), Offices of Technology Development, Nonproliferation and National Security, and Environmental Restoration, to conduct a test and demonstration of the uses of national remote sensing technologies at DOE hazardous waste sites located in Oak Ridge, Tennessee. Objectives of the Oak Ridge study were to determine if national remote sensing technologies are useful in conducting prescreening, characterization, and/or monitoring activities to expedite the clean-up process at hazardous waste sites and to cut clean-up costs wherever possible. This project was sponsored by the Strategic Environmental Research and Development Project (SERDP).

20813 (PNL–7722-Rev.2-Add.1) **[DOE method for evaluating environmental and waste management samples: Revision 1, Addendum 1].** Goheen, S.C. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 385p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95014291. Source: OSTI; NTIS; INIS; GPO Dep.

The US Dapartment of Energy's (DOE's) environmental and waste management (EM) sampling and analysis activities require that large numbers of samples be analyzed for materials characterization, environmental surveillance, and site-remediation programs. The present document, DOE Methods for Evaluating Environmental

and Waste Management Samples (DOE Methods), is a supplemental resource for analyzing many of these samples.

20814 (PNL–10255) **Evaluation of HWVP feed preparation chemistry for an NCAW simulant – Fiscal year 1993: Effect of noble metals concentration on offgas generation and ammonia formation.** Patello, G.K.; Wiemers, K.D.; Bell, R.D.; Smith, H.D.; Williford, R.E.; Clemmer, R.G. Pacific Northwest Lab., Richland, WA (United States). Mar 1995. 149p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95010687. Source: OSTI; NTIS; INIS; GPO Dep.

The High-Level Waste Vitrification Program is developing technology for the Department of Energy to immobilize high-level and transuranic wastes as glass for permanent disposal. Pacific Northwest Laboratory (PNL) is conducting laboratory-scale melter feed preparation studies using a HWVP simulated waste slurry, Neutralized Current Acid Waste (NCAW). A FY 1993 laboratory-scale study focused on the effects of noble metals (Pd, Rh, and Ru) on feed preparation offgas generation and NH_3 production. The noble metals catalyze H_2 and NH_3 production, which leads to safety concerns. The information gained from this study is intended to be used for technology development in pilot scale testing and design of the Hanford High-Level Waste Vitrification Facility. Six laboratory-scale feed preparation tests were performed as part of the FY 1993 testing activities using nonradioactive NCAW simulant. Tests were performed with 10%, 25%, 50% of nominal noble metals content. Also tested were 25% of the nominal Rh and a repeat of 25% nominal noble metals. The results of the test activities are described. 6 refs., 28 figs., 12 tabs.

20815 (PNL–10256) **Vapor space characterization of waste tank 241-BY-105: Results from samples collected on 7/7/94.** Pool, K.H.; Ligotke, M.W.; Clauss, T.W.; Lucke, R.B.; McVeety, B.D.; McCulloch, M.; Fruchter, J.S.; Goheen, S.C. Pacific Northwest Lab., Richland, WA (United States). May 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95012229. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes organic and inorganic results from vapors of the Hanford single-shell waste storage Tank 241-BY-105 (referred to as Tank BY-105). The results described here were obtained to support safety and toxicological evaluations. Quantitative results were obtained for the inorganic compounds ammonia (NH_3), nitrogen dioxide (NO_2), nitric oxide (NO), and water (H_2O). Sampling for hydrogen cyanide (HCN) and sulfur oxides (SO_x) was not requested. Several organic analytes were quantitatively determined, but quantities of non-TO-14 analytes were only estimated. Approximately 40 tentatively identified organic analytes were observed above the detection limit of (ca.) 10 ppb, but standards for most of these were not available at the time of analysis, and their quantitative determination is beyond the scope of this study. The SUMMA™ Canisters were also analyzed for components listed in U.S. Environmental Protection Agency (EPA) compendium Method TO-14. Of these only a few were observed above the 2-ppb detection limits. These are summarized in Table 3.1. Estimated quantitations also determined were of tentatively identified compounds (TICs). A summary of these results shows quantities of all TICs above the concentration of ca. 10 ppb. This consists of more than 40 organic analytes. The 6 organic analytes with the highest estimated concentrations are shown in Table 1. These 6 analytes account for approximately 45% of the total organic components in Tank BY-105. Detailed descriptions of the results appear in the text. Unlike tanks previously studied, normal paraffin hydrocarbons (NPHs) did not contribute significantly to the total organic concentration of the vapor headspace of Tank BY-105. The total concentration of TICs detected in the tank headspace samples was also much lower than that seen in other reported tanks averaging 6.5 Mg/m^3 for all three canisters collected.

20816 (PNL–10282) **Vapor space characterization of waste tank 241-BY-105 (in situ): Results from samples collected on May 9, 1994.** McVeety, B.D.; Pool, K.H.; Ligotke, M.W.; Clauss, T.W.; Lucke, R.B.; Sharma, A.K.; McCulloch, M.; Fruchter, J.S.; Goheen, S.C. Pacific Northwest Lab., Richland, WA (United States). May 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95012230. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes inorganic and organic analyses results from in situ samples obtained from the tank headspace of the Hanford waste storage Tank 241-BY-105 (referred to as Tank BY-105). The results described here were obtained to support safety and toxicological evaluations. A summary of the results for inorganic and organic analytes is listed. Detailed descriptions of the results appear in the text. Quantitative results were obtained for the inorganic compounds NH_3, NO_2, NO, HCN, and H_2O. Sampling for sulfur oxides was not requested. Results of the inorganic samples were affected by sampling errors that led to an undefined uncertainty in sample volume. Consequently, tank-headspace concentrations are estimated only. Thirty-nine tentatively identified organic analytes were observed above the detection limit of (ca.) 10 ppbv, but standards for most of these were not available at the time of analysis, and their quantitation is beyond the scope of this study. In addition, we looked for the 41 standard TO-14 analytes. Of these, only a few were observed above the 2-ppbv detection limit. The 16 organic analytes with the highest estimated concentrations are listed. These 16 analytes account for approximately 68% of the total or organic components in Tank BY-105.

20817 (PNL–10511) **Laboratory studies of gas generation and potential for tank wall corrosion during blending of high-level wastes at the West Valley Demonstration Project.** Gray, W.J.; Westerman, R.E. Pacific Northwest Lab., Richland, WA (United States). May 1995. 140p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95012764. Source: OSTI; NTIS; INIS; GPO Dep.

Laboratory experiments were conducted to simulate the transfer of acidic THOREX waste from Tank 8D-4 into the alkaline PUREX waste in Tank 8D-2 at West Valley. The purpose of the experiments was to explore means of minimizing the production of nitric oxide (NO) gas during mixing of the two wastes and to assess the potential for the gas to further react in the vapor space possibly leading to enhanced corrosion of the tank walls. Forty one THOREX/PUREX mixing tests were conducted to explore the effects of stirring rate, pH, THOREX addition rate, THOREX or PUREX dilution, and temperature. The two most important criteria for minimizing NO production were to maintain some degree of agitation and the keep the pH in the PUREX high, preferably >12. Steel corrosion tests were performed in the presence of low partial pressures of NO_2 and liquid water or water vapor. The NO_2 (from oxidation of NO in the vapor space) concentrations were representative of those derived from the THOREX/PUREX mixing tests. It was concluded that no significant corrosion of the tank walls would be expected under the anticipated THOREX/PUREX mixing conditions if the exposure was short (<100 days).

20818 (PNL-SA–24937) **Neural network based analysis for chemical sensor arrays.** Hashem, S.; Keller, P.E.; Kouzes, R.T.; Kangas, L.J. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 9p. Sponsored by USDOE, Washington, DC (United States);Associated Western Universities, Inc., Salt Lake City, UT (United States). DOE Contract FG06-89ER75522. (CONF-9504137–2: SPIE: aero sense conference, San Francisco, CA (United States), 17-21 Apr 1995). Order Number DE95011490. Source: OSTI; NTIS; GPO Dep.

Compact, portable systems capable of quickly identifying contaminants in the field are of great importance when monitoring the environment. In this paper, we examine the effectiveness of using artificial neural networks for real-time data analysis of a sensor array. Analyzing the sensor data in parallel may allow for rapid identification of contaminants in the field without requiring highly selective individual sensors. We use a prototype sensor array which consists of nine tin-oxide Taguchi-type sensors, a temperature sensor, and a humidity sensor. We illustrate that by using neural network based analysis of the sensor data, the selectivity of the sensor array may be significantly improved, especially when some (or all) the sensors are not highly selective.

20819 (SAIC–94-002) **A review of the methods used by the US Environmental Protection Agency to assess the financial impacts of the repository regulations.** Pflum, C.G.; Mattson, S.R.; Matthusen, A.C. Science Applications International Corp., Las

Vegas, NV (United States). 16 Feb 1994. 24p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012991. Source: OSTI; NTIS; INIS; GPO Dep.

All Federal agencies must consider the financial impacts of their regulations. When costs significantly outweigh benefits, the Office of Management and Budget can recommend that Congress not provide the funds needed to implement the regulation. Without funds, the agency is forced to either revise or retract the regulation. This has happened previously with a regulation on uranium mill tailings proposed by the US Nuclear Regulatory Commission (NRC) and it could happen again with the US Environmental Protection Agency (EPA) regulations that govern the disposal of high-level radioactive waste (HLW). The EPA (1985, 1992) claims that its regulation: "Environmental Standards for the Management and Disposal of Spent Nuclear Fuel, High-Level and Transuranic Radioactive Waste" (40 CFR Part 191 or standards) does not increase costs above what the US Department of Energy (DOE) would spend anyway or, at most, what the DOE would spend to comply with 10 CFR Part 60: a regulation promulgated by the NRC. This report reviews and disputes the EPA claim. In Chapter 2 a summary of the basis for the EPA claim is presented and in Chapter 3 a critique of the basis of the claim is presented. This critique finds the EPA basis unrealistic, incomplete, and misleading. According to the EPA, a repository at Yucca Mountain would easily meet 40 CFR Part 191 even without the use of special engineered barriers. Because the NRC regulation (10 CFR Part 60) requires engineered barriers, the EPA places the onus for regulatory costs on the NRC. We disagree; the EPA standards drive regulatory costs as much as NRC regulations. The EPA has the higher responsibility for setting the overall standard for safety while the NRC can only implement this standard.

20820 (SAND–92-2121) **Laboratory measurements of gas flow along a pressurized grout/membrane/halite interface for the Waste Isolation Pilot Plant.** Ucpirti, H. (Univ. of Nevada, Reno, NV (United States)); Daemen, J.J.K.; Finley, R.E.; George, J.T. Sandia National Labs., Albuquerque, NM (United States). Jan 1995. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95010335. Source: OSTI; NTIS; INIS; GPO Dep.

A series of laboratory gas-flow tests has been performed on interfaces comprised of concrete, very low-density polyethylene membrane, and halite. These tests were conducted to (1) evaluate whether a meaningful test can be run to quantify the effectiveness of a membrane, and (2) aid in the design of an Alcove Gas Barrier at the Waste Isolation Pilot Plant (WIPP), where membranes of this type are being considered for use at the interface between the concrete or grout of the gas barrier structure and the surrounding halite. Over 400 longitudinal transient-flow and steady-state radial-flow tests have been completed. However, it is not clear from these tests that the test results can be meaningfully applied to the full-scale Alcove Gas Barrier configuration because the measured permeabilities are several orders of magnitude higher than the meter-scale in situ concrete seal tests conducted at the WIPP as part of the Small-Scale Seal Performance Tests. Results show that the membranes decrease gas permeability along the concrete/halite interface by one to two orders of magnitude to below 10^{-15} m^2 for the simplified test configurations. 28 refs., 11 figs., 16 tabs.

20821 (SAND–94-2011) **Studies of thermohydrologic flow processes using TOUGH2. Yucca Mountain Site Characterization Project.** Ho, C.K.; Eaton, R.R. Sandia National Labs., Livermore, CA (United States). Dec 1994. 119p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95010777. Source: OSTI; NTIS; INIS; GPO Dep.

Coupled thermal and hydrologic flow processes have been recognized as important factors in the evaluation of Yucca Mountain as a potential repository for high-level radioactive wastes. As a result, several models and numerical codes such as TOUGH2 have been used to investigate the thermohydrologic conditions near a potential nuclear waste repository. However, very few of these models have been tested through laboratory or field scale studies. This work has therefore focused on modeling well-controlled experiments of non-isothermal flow processes in porous media at different scales to serve two primary objectives: (1) identify processes that are potentially important to thermal and hydrologic transport at Yucca Mountain and (2) build confidence in models and codes through combined experimental and numerical studies of thermohydrologic behavior at different scales and conditions. In this report, three independent studies of thermohydrologic flow processes at laboratory and field scales are presented. The experiments and field studies that are presented here were performed independently of this work. The main focus of this report was to use the numerical code TOUGH2 to simulate the non-isothermal flow behavior observed in each experiment to generate understanding of the thermohydrologic processes and to gain confidence in the code. TOUGH2 was chosen due to its current use in calculations associated with Yucca Mountain and its capability of modeling the coupled transport of air, water, vapor, and heat in porous media.

20822 (SAND–94-2032) **Annotated bibliography National Environmental Policy Act (NEPA) documents for Sandia National Laboratories.** Harris, J.M. Sandia National Labs., Albuquerque, NM (United States). Apr 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95011830. Source: OSTI; NTIS; INIS; GPO Dep.

The following annotated bibliography lists documents prepared by the Department of Energy (DOE), and predecessor agencies, to meet the requirements of the National Environmental Policy Act (NEPA) for activities and facilities at Sandia National Laboratories sites. For each NEPA document summary information and a brief discussion of content is provided. This information may be used to reduce the amount of time or cost associated with NEPA compliance for future Sandia National Laboratories projects. This summary may be used to identify model documents, documents to use as sources of information, or documents from which to tier additional NEPA documents.

20823 (SAND–94-2563/2) **Performance assessment of the direct disposal in unsaturated tuff or spent nuclear fuel and high-level waste owned by USDOE: Volume 2, Methodology and results.** Rechard, R.P. (ed.). Sandia National Labs., Albuquerque, NM (United States). Mar 1995. 679p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95011840. Source: OSTI; NTIS; INIS; GPO Dep.

This assessment studied the performance of high-level radioactive waste and spent nuclear fuel in a hypothetical repository in unsaturated tuff. The results of this 10-month study are intended to help guide the Office of Environment Management of the US Department of Energy (DOE) on how to prepare its wastes for eventual permanent disposal. The waste forms comprised spent fuel and high-level waste currently stored at the Idaho National Engineering Laboratory (INEL) and the Hanford reservations. About 700 metric tons heavy metal (MTHM) of the waste under study is stored at INEL, including graphite spent nuclear fuel, highly enriched uranium spent fuel, low enriched uranium spent fuel, and calcined high-level waste. About 2100 MTHM of weapons production fuel, currently stored on the Hanford reservation, was also included. The behavior of the waste was analyzed by waste form and also as a group of waste forms in the hypothetical tuff repository. When the waste forms were studied together, the repository was assumed also to contain about 9200 MTHM high-level waste in borosilicate glass from three DOE sites. The addition of the borosilicate glass, which has already been proposed as a final waste form, brought the total to about 12,000 MTHM.

20824 (SAND–94-3267) **Performance benefits of telerobotics and teleoperation - enhancements for an arm-based tank waste retrieval system.** Horschel, D.S. (Sandia National Labs., Albuquerque, NM (United States)); Gibbons, P.W.; Draper, J.V. Sandia National Labs., Albuquerque, NM (United States). Jun 1995. 120p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95013912. Source: OSTI; NTIS; INIS; GPO Dep.

This report evaluates telerobotic and teleoperational arm-based retrieval systems that require advanced robotic controls. These systems will be deployed in waste retrieval activities in Hanford's

Single Shell Tanks (SSTs). The report assumes that arm-based, retrieval systems will combine a teleoperational arm and control system enhanced by a number of advanced and telerobotic controls. The report describes many possible enhancements, spanning the full range of the control spectrum with the potential for technical maturation. The enhancements considered present a variety of choices and factors including: the enhancements to be included in the actual control system, safety, detailed task analyses, human factors, cost-benefit ratios, and availability and maturity of technology. Because the actual system will be designed by an offsite vendor, the procurement specifications must have the flexibility to allow bidders to propose a broad range of ideas, yet build in enough restrictions to filter out infeasible and undesirable approaches. At the same time they must allow selection of a technically promising proposal. Based on a preliminary analysis of the waste retrieval task, and considering factors such as operator limitations and the current state of robotics technology, the authors recommend a set of enhancements that will (1) allow the system to complete its waste retrieval mission, and (2) enable future upgrades in response to changing mission needs and technological advances.

20825 (SAND–95-8005) **Pollution prevention opportunity assessment for the supercritical water oxidation flow reactor.** Phillips, N.M. Sandia National Labs., Albuquerque, NM (United States). Jun 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95013916. Source: OSTI; NTIS; GPO Dep.

This pollution prevention opportunity assessment was conducted to evaluate the operation of the supercritical water oxidation flow reactor, which is located in Building 906, Room 107. This assessment documents the processes, identifies the hazardous chemical waste streams generated by these processes, recommends possible ways to minimize waste, and serves as a reference for future assessments of the supercritical water oxidation reactor process.

20826 (SKI-R–95-6) **Proceedings of the International seminar on design and manufacturing of copper canisters for nuclear waste.** Swedish Nuclear Power Inspectorate, Stockholm (Sweden); National Council for Nuclear Waste (KASAM), Stockholm (Sweden). Feb 1995. 136p. (CONF-9404264–: International seminar on design and manufacturing of copper canisters for nuclear waste, Sollentuna (Sweden), 27-28 Apr 1994). Order Number DE95630821. Source: OSTI; NTIS; INIS.

Separate abstracts have been prepared for 10 of the 15 papers presented at the meeting.

20827 (UCRL-ID–116187-95-2) **The Mixed Waste Management Facility, monthly report, February 1995.** Streit, R.D. Lawrence Livermore National Lab., CA (United States). Mar 1995. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95013424. Source: OSTI; NTIS; INIS; GPO Dep.

Technical progress continued in general accordance with the Mixed Waste Management Facility (MWMF) FY95 Plan. Engineering development and design continued in support of preliminary design of MWMF major subsystems. Peer reviews have begun in preparation for system preliminary design reviews. Procurements in support of engineering design/development have continued to increase. Significant effort to provide technical and cost trade-off information for the Project Baseline Revision 1.2 (PB1.2) and FY97 Validation was completed. Management focus during February centered upon addressing the rebaseline for MWMF for the FY97 Validation in March, and upon completing the permitting strategy. We completed a consistent baseline plan for Validation that satisfied the DOE constraints of integration with DWTF, schedule stretchout, overall Project cost, and FY cost profiles. The revised permitting strategy was completed and reviewed by a number of stakeholders (LLNL, DOE, State). The proposed strategy involves no RCRA RD&D permit, since all technology demonstrations can be done with surrogates and using limited treatability studies. The expenses for February continue to run somewhat below the plan due to the limited new hiring. This is a result of uncertain DOE funding and guidance to keep personnel to a minimum. However, the spending rate is picking up due to initiation of procurements for engineering development and a minimum of essential new hires. A significant imbalance in the OPEX/CENRTC funding split for FY95 exists (about $2.1M); DOE/OAK began to seek resolution this month. Critical-path items are DWTF construction, NEPA, and permitting (for both MWMF and DWTF). Contractual issues have delayed award of the A&E contract for DWTF, but work-arounds are in progress to avoid schedule impact. NEPA and permitting issues are discussed below. Progress on preliminary design for MWMF is close to schedule.

20828 (UCRL-ID–116187-95-3) **The Mixed Waste Management Facility monthly report, March 1995.** Streit, R.D. Lawrence Livermore National Lab., CA (United States). Apr 1995. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95012590. Source: OSTI; NTIS; GPO Dep.

This document presents details of the monthly activities of Lawrence Livermore National Laboratory in regards to the Mixed Waste Management Facility. Topics discussed include: quality assurance; regulations; program support; public participation; conceptual design; plant start-up; project management; feed preparation; molten salt, electrochemical, and wet oxidation; process transport and storage; and final waste forms.

20829 (UCRL-ID–116210-Pt.2) **The Mixed Waste Management Facility: Technology selection and implementation plan, Part 2, Support processes.** Streit, R.D.; Couture, S.A. Lawrence Livermore National Lab., CA (United States). Mar 1995. 71p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95010919. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this document is to establish the foundation for the selection and implementation of technologies to be demonstrated in the Mixed Waste Management Facility, and to select the technologies for initial pilot-scale demonstration. Criteria are defined for judging demonstration technologies, and the framework for future technology selection is established. On the basis of these criteria, an initial suite of technologies was chosen, and the demonstration implementation scheme was developed. Part 1, previously released, addresses the selection of the primary processes. Part II addresses process support systems that are considered "demonstration technologies." Other support technologies, e.g., facility off-gas, receiving and shipping, and water treatment, while part of the integrated demonstration, use best available commercial equipment and are not selected against the demonstration technology criteria.

20830 (UCRL-ID–118660) **Ceramic package fabrication for YMP nuclear waste disposal.** Wilfinger, K. Lawrence Livermore National Lab., CA (United States). Aug 1994. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95011522. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this work is to develop alternate materials/design concepts to metal barriers for the Nevada Nuclear Waste Storage Investigations Project. There is some potential that site conditions may prove to be too aggressive for successful employment of the metal alloys under current consideration or that performance assessment models will predict metal container degradation rates that are inconsistent with the goal of substantially complete containment included in the NRC regulations. In the event that the anticipated lifetimes of metal containers are considered inadequate, alternate materials (i.e. ceramics or ceramic/metal composites) will be chosen due to superior corrosion resistance. This document was prepared using information taken from the open literature, conversations and correspondence with vendors, news releases and data presented at conferences to determine what form such a package might take. This discussion presents some ceramic material selection criteria, alternatives for the materials which might be used and alternatives for potential fabrication routes. This includes "stand alone" ceramic components and ceramic coatings/linings for metallic structures. A list of companies providing verbal or written information concerning the production of ceramic or ceramic lined waste containers appears at the end of this discussion.

20831 (UCRL-ID–118699) **Progress report on pre-test calculations for the large block test.** Lee, K.H. Lawrence Livermore

National Lab., CA (United States). 20 Jan 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95011433. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy's (DOE) Yucca Mountain Site Characterization Project (YMP) is investigating the suitability of the Topopah Spring tuff in the thick vadose zone at Yucca Mountain, Nevada, as a host rock for permanent disposal of high-level radioactive waste. As part of the YMP, a group of field tests, referred to as the Large Block Test (LBT), will be conducted on a large electrically heated block of Topopah Spring tuff, isolated at Fran Ridge, Nevada Test Site. The block, which will be 3 x 3 m in horizontal dimensions and 4.5 m in height, will be heated by electrical heaters. The goals of the LBT axe to gain information on the coupled thermal-mechanical-hydrological-chemical processes active in the near-field environment of a repository; to provide field data for testing and calibrating models; and to help the development of measurement systems and techniques. This progress report presents results of on-going numerical modeling calculations carried out in support of the LBT design. An equivalent continuum model with an upper boundary temperature of 60°C was used to simulate the hydrothermal response of the block to heating over a one-year period. The total heating power was started at 1500 W and later reduced to maintain an approximately uniform temperature of 138-140°C. For a homogeneous bulk permeability case, the results show the formation of a distinct dry-out zone in and around the heater plane, and well-developed condensation zones above and below the heater plane. For a heterogeneous permeability distribution, the condensation zone above the heater plane was not well developed. This difference in results suggests that water saturation changes might be sensitive to changes in bulk permeability distribution. Rock temperatures were almost unaffected by permeability distribution. Heat flow was dominated by conduction. No liquid flow through the top of the block was predicted.

20832 (UCRL-ID–119033) **Hydrological property measurements of Topopah Spring Tuff.** Roberts, J.J.; Lin, W. Lawrence Livermore National Lab., CA (United States). Apr 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95011434. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the progress made during FY 1994 on hydrological property measurements of samples from Topopah Spring tuff at Yucca Mountain, Nevada. These measurements were performed in the laboratory at Lawrence Livermore National Laboratory. This report contains descriptions of experimental designs and procedures, data, observations, and preliminary analyses, and also describes planned future work. The report is organized into three sections: (1) permeability of fractured Topopah Spring tuff as a function of temperature and confining pressure; (2) electrical properties of Topopah Spring tuff as a function of temperature and of saturation; and (3) moisture retention measurements of Topopah Spring tuff as a function of temperature.

20833 (UCRL-ID–119298) **Characterization of mixed waste for sorting and inspection using non-intrusive methods.** Roberson, G.P.; Ryon, R.W.; Bull, N.L. Lawrence Livermore National Lab., CA (United States). Dec 1994. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95012106. Source: OSTI; NTIS; INIS; GPO Dep.

Characterization of mixed wastes (that is, radioactive and otherwise hazardous) requires that all hazardous, non-conforming, and radioactive materials be identified, localized, and quantified. With such information, decisions can be made regarding whether the item is treatable or has been adequately treated. Much of the required information can be gained without taking representative samples and analyzing them in a chemistry laboratory. Non-intrusive methods can be used to provide this information on-line at the waste treatment facility. Ideally, the characterization would be done robotically, and either automatically or semi-automatically in order to improve efficiency and safety. For the FY94 Mixed Waste Operations (MWO) project, a treatable waste item is defined as a homogeneous metal object that has external radioactive or heavy metal hazardous contamination. Surface treatment of some kind would therefore be the treatment method to be investigated. The authors developed sorting and inspection requirements, and assessed viable non-intrusive techniques to meet these requirements. They selected radiography, computed tomography and X-ray fluorescence. They have characterized selected mock waste items, and determined minimum detectable amounts of materials. They have demonstrated the efficiency possible by integrating radiographic with tomographic data. Here, they developed a technique to only use radiographic data where the material is homogeneous (fast), and then switching to tomography in those areas where heterogeneity is detected (slower). They also developed a tomographic technique to quantify the volume of each component of a mixed material. This is useful for such things as determining ash content. Lastly, they have developed a document in MOSAIC, an Internet multi-media browser. This document is used to demonstrate the ability to share data and information world-wide.

20834 (UCRL-ID–120133) **Plutonium distribution: Summary of public and governmental support issues.** Pasternak, A. Lawrence Livermore National Lab., CA (United States). 31 Mar 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95013295. Source: OSTI; NTIS; GPO Dep.

Obtaining strong public and governmental support for the plutonium disposition program and for the projects comprising the selected disposition options will be essential to the success of the program in meeting non-proliferation goals established as national policy. This paper summarizes issues related to public and governmental support for plutonium disposition. Recommendations are offered which rest on two fundamental assumptions: (1) public and political support derive from public trust and confidence, and (2) despite widespread support for U.S. non-proliferation goals, establishing and operating facilities to carry out the program will entail controversy. Documentation for the Administration's policy on non-proliferation as it relates to plutonium disposition is cited and summarized as background for ongoing planning efforts by the Department of Energy (DOE). Consensus is a reasonable goal for efforts to secure public and governmental support for the plutonium disposition program and its elements; unanimity is very unlikely. The program will be aided by the popular recognition of the importance of the nation's non-proliferation goals, the potential for an energy dividend if an energy production option is selected ("Swords to Plowshares" metaphor), the possibility of influencing disposition decisions in other countries, and the clear need to do something with the excess material ("the no action alternative" will not suffice).

20835 (UCRL-JC–116418) **A heated large block test for high level nuclear waste management.** Lin, W.; Wilder, D.G.; Blink, J.A.; Blair, S.C.; Buscheck, T.A.; Glassley, W.E.; Lee, K.; Owens, M.W.; Roberts, J.J. Lawrence Livermore National Lab., CA (United States). Jan 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950435–2: 2. international conference on mechanics of jointed and faulted rock, Vienna (Austria), 10-14 Apr 1995). Order Number DE95011437. Source: OSTI; NTIS; INIS; GPO Dep.

The radioactive decay heat from high-level nuclear waste may, depending on the thermal load, create coupled thermal-mechanical-hydrological-chemical (TMHC) processes in the host rock of a repository. A heated large block test (LBT) is designed to understand some of the TNMC processes. A block of Topopah Spring tuff of about 3 x 3 x 4.5 m was isolated at Fran Ridge, Nevada Test Site. Small blocks of the rock adjacent to the large block were collected for laboratory testing of some individual thermal-mechanical, thermal-hydrological, and thermal-chemical processes. The large block will be heated by heaters within so that a dryout zone and a condensate zone will exist simultaneously. Guard heaters on the block sides will be used to minimize horizontal heat losses. A constant load of about 4 MPa will be applied to the top and sides of the large block. The sides will be sealed with moisture and thermal barriers. Temperature, moisture content, pore pressure, chemical composition, stress, displacement, electrical resistivity, acoustic emissions, and acoustic velocities will be measured throughout the block during the heating and cool-down phases. The results from the experiments on small blocks and the tests on the large block will provide a better understanding of some

concepts of the coupled TMHC processes. The progress of the project is presented in this paper.

20836 (UCRL-JC–118898) **Remotely controlled reagent feed system for mixed waste treatment Tank Farm.** Dennison, D.K.; Bowers, J.S.; Reed, R.K. Lawrence Livermore National Lab., CA (United States). Feb 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950877–8: 3. American Society for Mechanical Engineers biannual mixed waste symposium, Baltimore, MD (United States), 7-11 Aug 1995). Order Number DE95011965. Source: OSTI; NTIS; INIS; GPO Dep.

LLNL has developed and installed a large-scale. remotely controlled, reagent feed system for use at its existing aqueous low-level radioactive and mixed waste treatment facility (Tank Farm). LLNL's Tank Farm is used to treat aqueous low-level and mixed wastes prior to vacuum filtration and to remove the hazardous and radioactive components before it is discharged to the City of Livermore Water Reclamation Plant (LWRP) via the sanitary sewer in accordance with established limits. This reagent feed system was installed to improve operational safety and process efficiency by eliminating the need for manual handling of various reagents used in the aqueous waste treatment processes. This was done by installing a delivery system that is controlled either remotely or locally via a programmable logic controller (PLC). The system consists of a pumping station, four sets of piping to each of six 6,800-L (1,800-gal) treatment tanks, air-actuated discharge valves at each tank, a pH/temperature probe at each tank, and the PLC-based control and monitoring system. During operation, the reagents are slowly added to the tanks in a preprogrammed and controlled manner while the pH, temperature, and liquid level are continuously monitored by the PLC. This paper presents the purpose of this reagent feed system, provides background related to LLNL's low-level/mixed waste treatment processes, describes the major system components, outlines system operation, and discusses current status and plans.

20837 (UCRL-JC–118906) **Stereo vision based automated grasp planning.** Wilhelmsen, K. (Lawrence Livermore National Lab., CA (United States)); Huber, L.; Silva, D.; Grasz, E.; Cadapan, L. Lawrence Livermore National Lab., CA (United States). Feb 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950232–33: 6. American Nuclear Society meeting on robotics and remote systems, Monterey, CA (United States), 5-10 Feb 1995). Order Number DE95009618. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy has a need for treating existing nuclear waste. Hazardous waste stored in old warehouses needs to be sorted and treated to meet environmental regulations. Lawrence Livermore National Laboratory is currently experimenting with automated manipulations of unknown objects for sorting, treating, and detailed inspection. To accomplish these tasks, three existing technologies were expanded to meet the increasing requirements. First, a binocular vision range sensor was combined with a surface modeling system to make virtual images of unknown objects. Then, using the surface model information, stable grasp of the unknown shaped objects were planned algorithmically utilizing a limited set of robotic grippers. This paper is an expansion of previous work and will discuss the grasp planning algorithm.

20838 (UCRL-JC–119106) **The large block test, a progress report.** Lin, W. (and others); Wilder, D.; Blink, J.; Berge, P.; Blair, S.; Brugman, V.; Carlson, R.; Lee, K.; Owens, M.; Pletcher, R. Lawrence Livermore National Lab., CA (United States). Oct 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950570–20: International high-level radioactive waste management conference: progress toward understanding, Las Vegas, NV (United States), 1-5 May 1995). Order Number DE95011435. Source: OSTI; NTIS; INIS; GPO Dep.

The Yucca Mountain Site Characterization Project investigates Yucca Mountain, Nevada, for its suitability as a potential repository for high-level nuclear wastes. The major functional requirement of a nuclear waste repository is that radioactive nuclides should not significantly contaminate the accessible environment for the life span of a repository. When emplaced in a repository, the radioactive decay heat of the high-level nuclear waste may cause coupled thermal-mechanical-hydrological-chemical (TMHC) processes in the near-field. The coupled TMHC processes must be understood before model calculations can be performed to confidently predict the near-field environments. The Large Block Test (LBT) is designed to provide experiments with controlled boundary conditions so that they will be more useful for testing some of the concepts of the coupled TMHC processes. Specifically, the LBT will study the dominant heat transfer mechanism, condensate refluxing, rewetting of the dry-out zone following the cool-down of the block, deformation, and chemical variations in the water. The LBT will also evaluate test methodologies and instruments that may be employed in future tests at the Exploratory Studies Facility and evaluate the corrosion/oxidation potential of coupons of candidate waste package materials in a heated rock environment. This paper presents a progress report of the LBT.

20839 (UCRL-JC–119121) **Measuring geomechanical properties of Topopah Spring Tuff at the 1-meter scale.** Blair, S.C.; Berge, P.A. Lawrence Livermore National Lab., CA (United States). Nov 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950570–18: International high-level radioactive waste management conference: progress toward understanding, Las Vegas, NV (United States), 1-5 May 1995). Order Number DE95011441. Source: OSTI; NTIS; INIS; GPO Dep.

The Yucca Mountain Site Characterization Project is studying physical and chemical properties of Topopah Spring tuff and coupled thermal, mechanical, hydrological, and geochemical processes expected in the near-field environment of the potential waste repository at Yucca Mountain, Nevada. Investigating the suitability of Topopah Spring tuff as a host rock for radioactive waste disposal includes measuring mechanical properties. Since heterogeneities vary with scale, from vugs and cracks at the hand-sample scale to fractures and vertical variations in degree of welding at the outcrop scale, mechanical properties of the tuff depend on scale. The Lawrence Livermore National Laboratory has planned a Large Block Test (LBT) to investigate rock mass properties and coupled processes at elevated temperatures in Topopah Spring tuff at the scale of a few meters. This paper describes planned laboratory experiments in support of the LBT, to measure elastic properties and mechanical behavior of Topopah Spring tuff at the scale of a few cm to 1 m. The laboratory experiments will include measurement of stress-strain behavior, acoustic emissions during heating, and elastic wave velocities in small blocks of tuff.

20840 (UCRL-JC–119724) **The role of cation exchange in controlling groundwater chemistry at Aspo, Sweden.** Viani, B.E.; Bruton, C.J. Lawrence Livermore National Lab., CA (United States). Jan 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950570–19: International high-level radioactive waste management conference: progress toward understanding, Las Vegas, NV (United States), 1-5 May 1995). Order Number DE95011440. Source: OSTI; NTIS; INIS; GPO Dep.

Construction-induced groundwater flow has resulted in the mixing of relatively dilute shallow groundwater with more concentrated groundwater at depth in the underground Hard Rock Laboratory (HRL) at Aespoe, Sweden. The observed compositional variation of the mixed groundwater cannot be explained using a conservative mixing model. The geochemical modeling package EQ3/6, to which a cation-exchange model was added, was used to simulate mixing between the two fluids. The results of modeling simulations suggest that cation exchange between groundwater and fracture-lining clays can explain the major element fluid chemistry observed in the HRL. The quantity of exchanger required to match simulated with observed fluid chemistry is reasonable and is consistent with the observed fracture mineralogy. This preliminary study establishes cation exchange as a viable mechanism for controlling the chemical evolution of groundwaters in a fracture-dominated dynamic flow system. This modeling study also strengthens their confidence in the ability to model the potential effects of fracture-lining minerals on the transport of radionuclides in a high level nuclear waste repository.

20841 (UCRL-JC–119874) **Analysis and section of processes for the disposition of excess fissile material from nuclear weapon dismantlement in the United States.** Myers,

B.R. (Lawrence Livermore National Lab., CA (United States)); Armantrout, G.A.; Erickson, R. Lawrence Livermore National Lab., CA (United States). Feb 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9503148–1: Radioactive waste management and space meeting on peaceful disposition on weapon grade materials, Berlin (Germany), 3-9 Mar 1995). Order Number DE95011720. Source: OSTI; NTIS; GPO Dep.

The end of the cold war and the acceleration of nuclear disarmament efforts by the United States (US) and Russia are generating large quantities of surplus fissile nuclear materials that are no longer needed for military purposes. The safe and secure disposition of this surplus material to prevent theft or reuse in weapons has become a high priority for the US Department of Energy (USDOE). Many options exist for storage and disposition (use or disposal) of these surplus materials. The criteria, which have been developed from the basis for a preliminary "screening" of options, to eliminate from further consideration those options that do not meet minimal requirements. Factors, or attributes, contained in the screening and selection criteria include: (1) resistance to theft and diversion by unauthorized parties, (2) resistance to retrieval, extraction, and reuse by the host nation, (3) technical viability, (4) environmental, safety, and health impacts, (5) cost effectiveness, (6) timeliness, (7) fostering of progress and cooperation with Russia and others, (8) public and institutional acceptance, and (9) additional benefits. The evaluation of environmental impacts, in accordance with the US National Environmental Policy Ac (NEPA) process, is an integral part of the overall evaluation process. Because of the variety of physical and chemical forms of the nuclear material inventory, and because of the large number of possible disposition technologies and final forms, several hundred possible pathways to disposition have been defined and have undergone a systematic selection process. Also, because nuclear material disposition will have far ranging impacts, extensive public, in the form of public and stakeholder, input was integral to the selection process.

20842 (UCRL-JC–120053) **Disposition of excess fissile materials in deep boreholes.** Halsey, W.G. (Lawrence Livermore National Lab., CA (United States)); Danker, W.; Morley, R. Lawrence Livermore National Lab., CA (United States). Sep 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9509161–1: International surplus fissile materials conference, Berlin (Germany), 3-9 Sep 1995). Order Number DE95011692. Source: OSTI; NTIS; INIS; GPO Dep.

As a result of recent changes throughout the world, a substantial inventory of excess separated plutonium is expected to result from dismantlement of US nuclear weapons. The safe and secure management and eventual disposition of this plutonium, and of a similar inventory in Russia, is a high priority. A variety of options (both interim and permanent) are under consideration to manage this material. The permanent solutions can be categorized into two broad groups: direct disposal and utilization. Plutonium utilization options have in common the generation of high-level radioactive waste which will be disposed of in a mined geologic disposal system to be developed for spent reactor fuel and defense high level waste. Other final disposition forms, such as plutonium metal, plutonium oxide and plutonium immobilized without high-level radiation sources may be better suited to placement in a custom facility. This paper discusses a leading candidate for such a facility; deep (several kilometer) borehole disposition. The deep borehole disposition concept involves placing excess plutonium deep into old stable rock formations with little free water present. The safety argument centers around ancient groundwater indicating lack of migration, and thus no expected communication with the accessible environment until the plutonium has decayed.

20843 (USGS-OFR–94-342) **Summary of lithologic logging of new and existing boreholes at Yucca Mountain, Nevada, August 1993 to February 1994.** Geslin, J.K.; Moyer, T.C.; Buesch, D.C. Geological Survey, Denver, CO (United States). 1995. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI08-92NV10874. Order Number DE95011866. Source: OSTI; NTIS; INIS; GPO Dep.

Yucca Mountain, Nevada, is being investigated as a potential site for a high-level radioactive waste repository. This report summarizes the lithologic logging of new and existing boreholes at Yucca Mountain that was done from August 1993 to February 1994 by the Rock Characteristics Section, Yucca Mountain Project Branch, US Geological Survey (USGS). Units encountered during logging include Quaternary-Tertiary alluvium/colluvium, Tertiary Rainier Mesa Tuff, all units in the Tertiary Paintbrush Group, Tertiary Calico Hills Formation and Tertiary Prow Pass Tuff. We present criteria used for recognition of stratigraphic contacts, logging results as tables of contact depths for core from neutron (UZN) boreholes and graphical lithologic logs for core from non-UZN boreholes, and descriptions of several distinctive nonwelded tuffs recognized in the PTn hydrogeologic unit of the Paintbrush Group.

20844 (USGS-OFR–94-456) **Meteorological, stream-discharge, and water-quality data for water year 1992 from two basins in Central Nevada.** McKinley, P.W. (Geological Survey, Denver, CO (United States)); Oliver, T.A. USDOE Nevada Operations Office, Las Vegas, NV (United States); Geological Survey, Denver, CO (United States). 1995. 56p. Sponsored by Geological Survey, Reston, VA (United States);USDOE, Washington, DC (United States). DOE Contract AI08-92NV10874. Order Number DE95011552. Source: OSTI; NTIS; INIS; GPO Dep.

The US Geological Survey, in cooperation with the US Department of Energy, is studying Yucca Mountain, Nevada, as a potential repository for high level nuclear waste. As part of the Yucca Mountain Site Project, the analog recharge study is providing data for the evaluation of recharge to the Yucca Mountain ground-water system given a cooler and wetter climate than currently exists. The current and climatic conditions are favorable to the isolation of radioactive waste. Because waste isolation from the accessible environment for 10,000 years is necessary, climatic change and the potential for increased ground-water recharge need to be considered as part of the characterization of the potential repository. Therefore, two small basins, measuring less than 2 square miles, were studied to determine the volume of precipitation available for recharge to ground water. The semiarid 3-Springs Basin is located to the east of Kawich Peak in the Kawich Range east of Tonopah, Nevada. Stewart Basin is a subalpine drainage basin north of Arc Dome in the Toiyabe Range north of Tonopah, Nevada. The purpose of this publication is to make available the meteorological, stream-discharge, and water-quality data collected during the study. Meteorological data collected include air temperature, soil temperature, solar radiation, and relative humidity. Stream-discharge data were collected from the surface-water outlet of each basin. Water-quality data are chemical analyses of water samples collected from surface- and ground-water sources. Each basin has a meteorological station located in the lower and upper reaches of the basin. Hydrologic records include stream-discharge and water-quality data from the lower meteorological site and water-quality data from springs within the basins.

20845 (WHC-EP–0474-16) **Quarterly report on the Ferrocyanide Safety Program for the period ending, March 31, 1995.** Cash, R.J.; Meacham, J.E.; Dukelow, G.T. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 87p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95012969. Source: OSTI; NTIS; INIS; GPO Dep.

This quarterly report provides a status of the activities underway on the Ferrocyanide Safety Issue at the Hanford Site, including actions in response to Defense Nuclear Facilities Safety Board (DNFSB) Recommendation 90-7 (FR 1990). In March 1991, a DNFSB implementation plan (Cash 1991) responding to the six parts of Recommendation 90-7 was prepared and sent to the DNFSB. A Ferrocyanide Safety Program Plan addressing the total Ferrocyanide Safety Program, including the six parts of DNFSB Recommendation 90-7, was released in October 1994 (DOE 1994b). Activities in the program plan are underway or have been completed, and the status of each is described in Sections 2.0 and 3.0 of this report.

20846 (WHC-EP–0827-Rev.1) **Overview of the performance objectives and scenarios of TWRS Low-Level Waste Disposal Program. Revision 1.** Westinghouse Hanford Co., Richland, WA

(United States). Jan 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010576. Source: OSTI; NTIS; INIS; GPO Dep.

As a result of past Department of Energy (DOE) weapons material production operations, Hanford now stores nuclear waste from processing facilities in underground tanks on the 200 area plateau. An agreement between the DOE, the Environmental Protection Agency (EPA), and the Washington state Department of Ecology (the Tri-Party Agreement, or TPA) establishes an enforceable schedule and a technical framework for recovering, processing, solidifying, and disposing of the Hanford tank wastes. The present plan includes retrieving the tank waste, pre-treating the waste to separate into low level and high level streams, and converting both streams to a glass waste form. The low level glass will represent by far the largest volume and lowest quantity of radioactivity (i.e., large volume of waste chemicals) of waste requiring disposal. The low level glass waste will be retrievably stored in sub-surface disposal vaults for several decades. Assuming the low level disposal system proves to be acceptable, the disposal site will be closed with the low level waste in place. If the disposal system is not acceptable, then the waste will be subject to possible retrieval followed by some other disposal solution. Westinghouse Hanford Company is also planning to emplace the waste so that it is retrievable for up to 50 years after completion of the tank waste processing.

20847 (WHC-EP–0828) **Scenarios of the TWRS low-level waste disposal program.** Westinghouse Hanford Co., Richland, WA (United States). Oct 1994. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012840. Source: OSTI; NTIS; INIS; GPO Dep.

As a result of past Department of Energy (DOE) weapons material production operations, Hanford now stores nuclear waste from processing facilities in underground tanks on the 200 Area plateau. An agreement between the DOE, the Environmental Protection Agency (EPA), and the Washington state Department of Ecology (the Tri-Party Agreement, or TPA) establishes an enforceable schedule and a technical framework for recovering, processing, solidifying, and disposing of the Hanford tank wastes. The present plan includes retrieving the tank waste, pretreating the waste to separate into low level and high level streams, and converting both streams to a glass waste form. The low level glass will represent by far the largest volume and lowest quantity of radioactivity (i.e., large volume of waste chemicals) of waste requiring disposal. The low level glass waste will be retrievably stored in sub-surface disposal vaults for several decades. If the low level disposal system proves to be acceptable, the disposal site will be closed with the low level waste in place. If, however, at some time the disposal system is found to be unacceptable, then the waste can be retrieved and dealt with in some other manner. WHC is planning to emplace the waste so that it is retrievable for up to 50 years after completion o the tank waste processing. Acceptability of disposal of the TWRS low level waste at Hanford depends on technical, cultural, and political considerations. The Performance Assessment is a major part of determining whether the proposed disposal action is technically defensible. A Performance Assessment estimates the possible future impact to humans and the environment for thousands of years into the future. In accordance with the TPA technical strategy, WHC plans to design a near-surface facility suitable for disposal of the glass waste.

20848 (WHC-EP–0828-Rev.1) **Scenarios of the TWRS low-level waste disposal program. Revision 1.** Westinghouse Hanford Co., Richland, WA (United States). Jan 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012791. Source: OSTI; NTIS; INIS; GPO Dep.

WHC is planning to emplace the waste so that it is retrievable for up to 50 years after completion of the tank waste processing. Acceptability of disposal of the TWRS low level waste at Hanford depends on technical, cultural, and political considerations. The Performance Assessment is a major part of determining whether the proposed disposal action is technically defensible. A Performance Assessment estimates the possible future impact to humans and the environment for thousands of years into the future. In accordance with the TPA technical strategy, WHC plans to design a near-surface facility suitable for disposal of the glass waste.

20849 (WHC-EP–0856) **Tank waste remediation system operational scenario.** Johnson, M.E. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013573. Source: OSTI; NTIS; INIS; GPO Dep.

The Tank Waste Remediation System (TWRS) mission is to store, treat, and immobilize highly radioactive Hanford waste (current and future tank waste and the strontium and cesium capsules) in an environmentally sound, safe, and cost-effective manner (DOE 1993). This operational scenario is a description of the facilities that are necessary to remediate the Hanford Site tank wastes. The TWRS Program is developing technologies, conducting engineering analyses, and preparing for design and construction of facilities necessary to remediate the Hanford Site tank wastes. An Environmental Impact Statement (EIS) is being prepared to evaluate proposed actions of the TWRS. This operational scenario is only one of many plausible scenarios that would result from the completion of TWRS technology development, engineering analyses, design and construction activities and the TWRS EIS. This operational scenario will be updated as the development of the TWRS proceeds and will be used as a benchmark by which to evaluate alternative scenarios.

20850 (WHC-EP–0863) **Centralized consolidation/recycling center.** St. Georges, L.T. (Westinghouse Hanford Co., Richland, WA (United States)); Poor, A.D. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013580. Source: OSTI; NTIS; INIS; GPO Dep.

There are approximately 175 separate locations on the Hanford Site where dangerous waste is accumulated in hundreds of containers according to compatibility. Materials that are designated as waste could be kept from entering the waste stream by establishing collection points for these materials and wastes and then transporting them to a centralized consolidation/recycling center (hereinafter referred to as the consolidation center). Once there the materials would be prepared for offsite recycling. This document discusses the removal of batteries, partially full aerosol cans, and DOP light ballasts from the traditional waste management approach, which eliminates 89 satellite accumulation areas from the Hanford Site (43 for batteries, 33 for aerosols, and 13 for DOP ballasts). Eliminating these 89 satellite accumulation areas would reduce by hundreds the total number of containers shipped offsite as hazardous waste (due to the increase in containers when the wastes that are accumulated are segregated according to compatibility for final shipment). This new approach is in line with the U.S. Environmental Protection Agency's (EPA) draft Universal Waste Rules for these "nuisance" and common waste streams. Additionally, future reviews of other types of wastes that can be handled in this less restrictive and more cost-effective manner will occur as part of daily operations at the consolidation center. The Hanford Site has been identified as a laboratory for reinventing government by the Secretary of the U.S. Department of Energy (DOE), Hazel

O'Leary, and as a demonstration zone where "innovative ideas, processes and technologies can be created, tested and demonstrated." Additionally, DOE, EPA, and the Washington State Department of Ecology (Ecology) have agreed to cut Hanford cleanup costs by $1 billion over a 5-year period.

20851 (WHC-SA–2616) **A parametric study of double-shell tank response to internal high-frequency pressure loading.** Baliga, R. (ADVENT Engineering Services, Inc., San Ramon, CA (United States)); Choi, K.; Shulman, J.S.; Strehlow, J.P.; Abatt, G. Westinghouse Hanford Co., Richland, WA (United States). Feb 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950740–40: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95008787. Source: OSTI; NTIS; INIS; GPO Dep.

The double-shell waste tank 241SY101 (SY101) is a 3,785,400-liter tank used to store radioactive waste at the Hanford Site near Richland, Washington. The tank waste has formed two layers of sludge in the tank; a convective and a nonconvective layer. Ongoing reactions in the waste cause a buildup of hydrogen molecules that become trapped within the nonconvective layer of the waste. Various means of preventing the buildup of hydrogen molecules in the nonconvective layer have been investigated, including the use of a sonic probe that would transmit high-frequency acoustic pressure waves into the nonconvective layer of the waste. During the operation of the sonic probe, the pressure waves transmitted from the probe induce pressure time history loading on the inside surface of the primary tank. For low-frequency fluid-structure interaction loads, such as those associated with seismic events, the convective and impulsive effects of the waste-filled tank are well documented. However, for high-frequency loading, such as that associated with acoustic pressure waves, interactions between the waste and the primary tank are not understood. The pressure time history is represented by a harmonic function with a frequency range between 30 and 100 Hz. Structural analyses of the double-shell tank have been performed that address the tank's response to the sonic probe acoustic pressure loads. This paper addresses the variations in the tank response as a function of percent waste mass considered to be effective in the dynamic excitation of the tank. It also compares results predicted by analyses that discretely model the liquid waste and presents recommendations for the simplified effective mass approach. Also considered in the parametric study is the effect of damping on the tank response for the same pressure loading.

20852 (WHC-SA–2643) **Issues in performance assessments for disposal of US Department of Energy low-level waste.** Wood, D.E. (Westinghouse Hanford Co., Richland, WA (United States)); Wilhite, E.L.; Duggan, G.J. Westinghouse Hanford Co., Richland, WA (United States). Dec 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950917–7: 5. international conference on radioactive waste management and environmental remediation, Berlin (Germany), 3-9 Sep 1995). Order Number DE95007781. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) and its contractors have long been pioneers in the field of radiological performance assessment (PA). Much effort has been expended in developing technology and acquiring data to facilitate the assessment process. This is reflected in DOE Order 5820.2A, Radioactive Waste Management Chapter III of the Order lists policy and requirements to manage the DOEs low-level waste; performance objectives for low-level waste management are stated to ensure the protection of public health and the environment. A radiological PA is also required to demonstrate compliance with the performance objectives. DOE Order 5820.2A further requires that an Oversight and Peer Review Panel be established to ensure consistency and technical quality around the DOE complex in the development and application of PA models that include site-specific geohydrology and waste composition. The DOE has also established a Performance Assessment Task Team (PATT) to integrate the activities of sites that are preparing PAs. The PATT's purpose is to recommend policy and guidance to DOE on issues that impact PAs so that the approaches taken are as consistent as possible across the DOE complex.

20853 (WHC-SA–2761) **Educational understanding of pollution prevention in decontamination and decommissioning/environmental restoration activities.** Betsch, M.D. (Westinghouse Hanford Co., Richland, WA (United States)); Lewis, R.A. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-9505111–3: 11. pollution prevention conference: shaping the future through pollution prevention involvement - commitment - progress, Knoxville, TN (United States), 16-18 May 1995). Order Number DE95012573. Source: OSTI; NTIS; INIS; GPO Dep.

Demolishing outdated structures from the US Department of Energy Hanford Site in Washington, generates large quantities of waste which can be minimized. The Hanford cleanup is one of the world's largest and most complex environmental restoration efforts. Approximately 280 square miles of ground water and soil are contaminated; there are more than 80 surplus facilities, including nine shut-down nuclear reactors in various stages of decay; and there are 177 underground waste storage tanks containing highly radioactive waste. In all, 1,500 cleanup sites have been identified and the Environmental Restoration Contractor (ERC) is currently responsible for surveillance and maintenance of 170 structures. A two hour orientation training in pollution prevention was developed by the Westinghouse Hanford Company to provide all Decontamination and Decommissioning/Environmental Restoration (D&D/ER) personnel with the knowledge to apply waste minimization principles during their cleanup activities. The ERC Team Pollution Prevention Workshop serves to communicate pollution prevention philosophies and influences the way D&D/ER projects are conducted at the Hanford Site.

20854 (WHC-SA–2768) **Laboratory waste minimization during the operation startup phase.** Morrison, J.A. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-9505111–2: 11. pollution prevention conference: shaping the future through pollution prevention involvement - commitment - progress, Knoxville, TN (United States), 16-18 May 1995). Order Number DE95013574. Source: OSTI; NTIS; INIS; GPO Dep.

The Waste Sampling and Characterization Facility (WSCF) Laboratory was opened for occupancy in October, 1994. It is the first of its kind on the Hanford Site, a low level lab located in an area of high level radiological material. The mission of the facility is to analyze process samples from two on-line effluent treatment plants. One of these plants is operating and the other is due to begin operations by the end of 1995. The VSCF also performs air sampling analysis for routine radiological surveillance filter papers drawn from around the Hanford Site. Because this type of laboratory had not been in operation before, there was only speculation about the types and amounts of waste that would be generated. The laboratory personnel assigned to WSCF were assembled from existing labs on the Hanford Site and from outside the Hanford Site community. For some, it was a first time experience working on a site where a twenty mile drive is sometimes required to visit another building. For others, it was a change in the way business is conducted using state-of-the-art equipment, a new building, and a chance to approach issues as a team from the beginning. It is how this team came together and the issues that were discussed, sometimes uncomfortably, that lead to the current success. The outcome of this process is discussed in this paper.

20855 (WHC-SA–2777) **Introduction to Radcalc: A computer program to calculate the radiolytic production of hydrogen gas from radioactive wastes in packages.** Green, J.R. (and others); Hillesland, K.E.; Field, J.G. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-9506150–5: 2. annual Department of Energy defense programs packaging workshop, San Francisco, CA (United States), 12-15 Jun 1995). Order Number DE95012839. Source: OSTI; NTIS; INIS; GPO Dep.

A calculational technique for quantifying the concentration of hydrogen generated by radiolysis in sealed radioactive waste containers was developed in a U.S. Department of Energy (DOE)

study conducted by EG&G Idaho, Inc., and the Electric Power Research Institute (EPRI) TMI-2 Technology Transfer Office. The study resulted in report GEND-041, entitled "A Calculational Technique to Predict Combustible Gas Generation in Sealed Radioactive Waste Containers". The study also resulted in a presentation to the U.S. Nuclear Regulatory Commission (NRC) which gained acceptance of the methodology for use in ensuring compliance with NRC IE Information Notice No. 84-72 (NRC 1984) concerning the generation of hydrogen within packages. NRC IE Information Notice No. 84-72: "Clarification of Conditions for Waste Shipments Subject to Hydrogen Gas Generation" applies to any package containing water and/or organic substances that could radiolytically generate combustible gases. EPRI developed a simple computer program in a spreadsheet format utilizing GEND-041 calculational methodology to predict hydrogen gas concentrations in low-level radioactive wastes containers termed Radcalc. The computer code was extensively benchmarked against TMI-2 (Three Mile Island) EPICOR II resin bed measurements. The benchmarking showed that the model developed predicted hydrogen gas concentrations within 20% of the measured concentrations. Radcalc for Windows was developed using the same calculational methodology. The code is written in Microsoft Visual C++ 2.0 and includes a Microsoft Windows compatible menu-driven front end. In addition to hydrogen gas concentration calculations, Radcalc for Windows also provides transportation and packaging information such as pressure buildup, total activity, decay heat, fissile activity, TRU activity, and transportation classifications.

20856 (WHC-SA–2865) **Early containment of high-alkaline solution simulating low-level radioactive waste stream in clay-bearing blended cement.** Kruger, A.A. (Westinghouse Hanford Co., Richland, WA (United States)); Olson, R.A.; Tennis, P.D. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013576. Source: OSTI; NTIS; INIS; GPO Dep.

Portland cement blended with fly ash and attapulgite clay was mixed with high-alkaline solution simulating low-level radioactive waste stream at a one-to-one weight ratio. Mixtures were adiabatically and isothermally cured at various temperatures and analyzed for phase composition, total alkalinity, pore solution chemistry, and transport properties as measured by impedance spectroscopy. Total alkalinity is characterized by two main drops. The early one corresponds to a rapid removal of phosphorous, aluminum, sodium, and to a lesser extent potassium solution. The second drop from about 10 h to 3 days is mainly associated with the removal of aluminum, silicon, and sodium. Thereafter, the total alkalinity continues descending, but at a lower rate. All pastes display a rapid flow loss that is attributed to an early precipitation of hydrated products. Hemicarbonate appears as early as one hour after mixing and is probably followed by apatite precipitation. However, the former is unstable and decomposes at a rate that is inversely related to the curing temperature. At high temperatures, zeolite appears at about 10 h after mixing. At 30 days, the stabilized crystalline composition includes zeolite, apatite and other minor amounts of $CaCO_3$, quartz, and monosulfate Impedance spectra conform with the chemical and mineralogical data. The normalized conductivity of the pastes shows an early drop, which is followed by a main decrease from about 12 h to three days. At three days, the permeability of the cement-based waste as calculated by Katz-Thompson equation is over three orders of magnitude lower than that of ordinary portland cement paste. However, a further decrease in the calculated permeability is questionable. Chemical stabilization is favorable through incorporation of waste species into apatite and zeolite.

20857 (WHC-SD-534-CSWD–005-Rev.2) **242-A Control System device logic software documentation. Revision 2.** Berger, J.F. Westinghouse Hanford Co., Richland, WA (United States). 19 May 1995. 83p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013342. Source: OSTI; NTIS; INIS; GPO Dep.

A Distributive Process Control system was purchased by Project B-534. This computer-based control system, called the Monitor and Control System (MCS), was installed in the 242-A Evaporator located in the 200 East Area. The purpose of the MCS is to monitor and control the Evaporator and Monitor a number of alarms and other signals from various Tank Farm facilities. Applications software for the MCS was developed by the Waste Treatment System Engineering Group of Westinghouse. This document describes the Device Logic for this system.

20858 (WHC-SD-CP-OCD–040-Rev.1) **Basis document for sludge stabilization. Revision 1.** Dayley, L. Westinghouse Hanford Co., Richland, WA (United States). 5 Apr 1995. 103p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010701. Source: OSTI; NTIS; INIS; GPO Dep.

This document contains the technical basis for the operating specifications to be used in the Sludge Stabilization Process at the Plutonium Finishing Plant.

20859 (WHC-SD-CP-QAPP–017) **Quality Assurance Program Plan for the Waste Sampling and Characterization Facility.** Grabbe, R.R. Westinghouse Hanford Co., Richland, WA (United States). 2 Mar 1995. 105p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008870. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this Quality Assurance Plan is to provide quality assurance (QA) guidance, implementation of regulatory QA requirements, and quality control (QC) specifications for analytical service. This document follows the Department of Energy (DOE)-issued Hanford Analytical Services Quality Assurance Plan (HASQAP) and additional federal [10 US Code of Federal Regulations (CFR) 830.120] QA requirements that HASQAP does not cover. This document describes how the laboratory implements QA requirements to meet the federal or state requirements, provides what are the default QC specifications, and/or identifies the procedural information that governs how the laboratory operates. In addition, this document meets the objectives of the Quality Assurance Program provided in the WHC-CM-4-2, Section 2.1. This document also covers QA elements that are required in the Guidelines and Specifications for Preparing Quality Assurance Program Plans (QAPPs), (QAMS-004), and Interim Guidelines and Specifications for Preparing Quality Assurance Product Plans (QAMS-005) from the Environmental Protection Agency (EPA). A QA Index is provided in the Appendix A.

20860 (WHC-SD-FL-MAR–001) **308 Building deactivation mission analysis report.** Lund, D.P. Westinghouse Hanford Co., Richland, WA (United States). 24 May 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013900. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the results of the 308 Building (Fuels Development Laboratory) Deactivation Project mission analysis. Hanford systems engineering (SE) procedures call for a mission analysis. The mission analysis is an important first step in the SE process. The functions and requirements to successfully accomplish this mission, the selected alternatives and products will later be defined using the SE process.

20861 (WHC-SD-FL-MAR–002) **300 Area fuel supply facilities deactivation mission analysis report.** Lund, D.P. Westinghouse Hanford Co., Richland, WA (United States). 24 May 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013882. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the results of the 300 Area fuel supply facilities (formerly call "N reactor fuel fabrication facilities") Deactivation Project mission analysis. Hanford systems engineering (SE) procedures call for a mission analysis. The mission analysis is an important first step in the SE process.

20862 (WHC-SD-NR-ISB–001) **Interim safety basis for fuel supply shutdown facility.** Brehm, J.R.; Deobald, T.L.; Benecke, M.W.; Remaize, J.A. Westinghouse Hanford Co., Richland, WA (United States). 23 May 1995. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013349. Source: OSTI; NTIS; INIS; GPO Dep.

This ISB in conjunction with the new TSRs, will provide the required basis for interim operation or restrictions on interim operations and administrative controls for the Facility until a SAR is prepared in accordance with the new requirements. It is concluded that the risk associated with the current operational mode of the Facility, uranium closure, clean up, and transition activities required for permanent closure, are within Risk Acceptance Guidelines. The Facility is classified as a Moderate Hazard Facility because of the potential for an unmitigated fire associated with the uranium storage buildings.

20863 (WHC-SD-SNF-ATR–004) **Acceptance test procedure for the 105-KW isolation barrier leak rate.** McCracken, K.J. Westinghouse Hanford Co., Richland, WA (United States). 19 May 1995. 292p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013345. Source: OSTI; NTIS; INIS; GPO Dep.

This acceptance test procedure shall be used to: First establish a basin water loss rate prior to installation of the two isolation barriers between the main basin and the discharge chute in K-Basin West. Second, perform an acceptance test to verify an acceptable leakage rate through the barrier seals. This Acceptance Test Procedure (ATP) has been prepared in accordance with CM-6-1 EP 4.2, Standard Engineering Practices.

20864 (WHC-SD-SNF-TRP–007) **105K West Isolation Barrier Acceptance Test results.** McCracken, K.J. (ICF Kaiser Hanford Co., Richland, WA (United States)); Irwin, J.J. ICF Kaiser Hanford Co., Richland, WA (United States). 18 May 1995. 61p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013343. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this document is to report and interpret the findings of the isolation barrier acceptance tests performed in 105KW/100K. The tests were performed in accordance with the test plan and acceptance test procedure. The test report contains the test data. This document compares the test data against the criteria. A discussion of the leak rate analytical characterization describes how the flow characteristics flow rate will be determined using the test data from the test report. Two modes of water loss were considered; basin and/or discharge chute leakage, and evaporation. An initial test established baseline leakage data and instrumentation performance. Test 2 evaluated the sealing performance of the isolation barrier by inducing an 11 in. (27.9 cm) level differential across the barrier. The leak rate at this 11 in. (27.9 cm) level is extrapolated to the 16 ft. (4.9 m) level differential postulated in the DBE post seismic event. If the leak rate, adjusted for evaporation and basin leakage (determined from Test 1), is less than the SAR limit of 1,500 gph (5,680 lph) at a 16 ft (4.9 m) level differential, the barriers pass the acceptance test.

20865 (WHC-SD-SP-MAR–001) **309 Building deactivation mission analysis report.** Lund, D.P. Westinghouse Hanford Co., Richland, WA (United States). 24 May 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013884. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the results of the 309 Building (Plutonium Fuels Utilization Program) Deactivation Project mission analysis. Hanford systems engineering (SE) procedures call for a mission analysis. The mission analysis is an important first step in the SE process. The functions and requirements to successfully accomplish this mission, the selected alternatives and products will later be defined using the SE process.

20866 (WHC-SD-SQA-CSWD–20022) **ABAQUS 5.4 software configuration.** Marlow, R.S. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012793. Source: OSTI; NTIS; GPO Dep.

ABAQUS 5.4 is a powerful general purpose finite-element computer program for the radioactive waste tank program. This document describes the verification and validation of ABAQUS 5.4 as installed on the Scientific and Engineering Computing Center.

20867 (WHC-SD-W026-PLN–007) **WRAP module 1 treatment plan.** Mayancsik, B.A. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012952. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides the methodology to treat waste in the Waste Receiving and Processing Module 1 facility to meet the Resource Conservation and Recovery Act (RCRA) land disposal restrictions or the Waste Isolation and Pilot Plant waste acceptance criteria. This includes Low-Level Mixed Waste, Transuranic Waste, and Transuranic Mixed Waste.

20868 (WHC-SD-W030-ATP–003) **Acceptance Test Procedure for Cathodic Protection, Rectifier 11.** Clifton, F.T. Westinghouse Hanford Co., Richland, WA (United States). 28 Apr 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011634. Source: OSTI; NTIS; INIS; GPO Dep.

This Acceptance Test Procedure for Project W-030 Cathodic Protection Installation, 241-AY and 241-AZ Tank Farm Ventilation Upgrade, has been prepared to demonstrate that the cathodic protection system functions as required by project criteria.

20869 (WHC-SD-W105-SWD–1-Rev.1) **242-A/LERF programmable Logic Controller Ladder. Revision 1.** Teats, M.C. Westinghouse Hanford Co., Richland, WA (United States). 23 May 1995. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013905. Source: OSTI; NTIS; GPO Dep.

This document defines and describes the user-generated application software written to transmit digital and analog signals from the Liquid Effluent Retention Facility (LERF) to the 242-A Evaporator Distributed Control System (DCS). PLCs and modems were installed in the 242-A Evaporator by Project W-105 (LERF) to transmit 6 analog liquid level signals, 6 range alarms based on the analog signals, and 6 leak detection and pump status signals to the 242-A Distributive Control System (DCS) from LERF. Communications between the two facilities are also monitored and alarm on the DCS. Following the Project W-105 completion, the communications and signal mix were modified by Project C-018H (ETF). The current PLC software (including ladder logic and data tables), PLC hardware settings, and modem option settings to transmit the signals and monitor communications are documented and described in this document.

20870 (WHC-SD-W236A-EL–002) **Safety equipment list.** Lavender, J.C. (Westinghouse Hanford Co., Richland, WA (United States)); Roe, N.A. Westinghouse Hanford Co., Richland, WA (United States); ICF Kaiser Hanford Co., Richland, WA (United States). 13 Apr 1995. 607p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010764. Source: OSTI; NTIS; GPO Dep.

This analysis assigns preliminary safety class (SC) designations to major systems and structures associated with the Multi-Function Waste Tank Facility (MWTF) project in accordance with the Multi-Function QAPP, W-236A (Hall 1994). Also included are SC assignments for those subsystems and major components of the major systems discussed in this document (see Appendices A and B). Component safety classifications have been completed through inspection (using engineering judgement) for simple systems, and through use of logic models (i.e., fault trees) for complicated systems. This analysis is intended to augment the SC systems list supplied in Chapter 9 of the MWTF Preliminary Safety Analysis Report (WHC 1994). Whereas WHC (1994) only addresses select systems, this analysis addresses the SC ramifications of all MWTF systems and structures as identified in the Title 1 design media. This document provides additional analyses of the system safety classifications assignments, and classifies systems not addressed in WHC (1994). This analysis specifically describes the safety functions) that must be performed by each MWTF system.

20871 (WHC-SD-W236A-ER–013) **Concrete material characterization reinforced concrete tank structure Multi-Function Waste Tank Facility.** Winkel, B.V. Westinghouse Hanford Co., Richland, WA (United States). 3 Mar 1995. 92p. Sponsored by

USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008864. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this report is to document the Multi-Function Waste Tank Facility (MWTF) Project position on the concrete mechanical properties needed to perform design/analysis calculations for the MWTF secondary concrete structure. This report provides a position on MWTF concrete properties for the Title 1 and Title 2 calculations. The scope of the report is limited to mechanical properties and does not include the thermophysical properties of concrete needed to perform heat transfer calculations. In the 1970's, a comprehensive series of tests were performed at Construction Technology Laboratories (CTL) on two different Hanford concrete mix designs. Statistical correlations of the CTL data were later generated by Pacific Northwest Laboratories (PNL). These test results and property correlations have been utilized in various design/analysis efforts of Hanford waste tanks. However, due to changes in the concrete design mix and the lower range of MWTF operating temperatures, plus uncertainties in the CTL data and PNL correlations, it was prudent to evaluate the CTL data base and PNL correlations, relative to the MWTF application, and develop a defendable position. The CTL test program for Hanford concrete involved two different mix designs: a 3 kip/in^2 mix and a 4.5 kip/in^2 mix. The proposed 28-day design strength for the MWTF tanks is 5 kip/in^2. In addition to this design strength difference, there are also differences between the CTL and MWTF mix design details. Also of interest, are the appropriate application of the MWTF concrete properties in performing calculations demonstrating ACI Code compliance. Mix design details and ACI Code issues are addressed in Sections 3.0 and 5.0, respectively. The CTL test program and PNL data correlations focused on a temperature range of 250 to 450 F. The temperature range of interest for the MWTF tank concrete application is 70 to 200 F.

20872 (WHC-SD-W236A-ER–018-Rev.1) **MWTF, material selection for insulating/supporting pad letter report. Revision 1.** Stine, M.D. Westinghouse Hanford Co., Richland, WA (United States). 25 Apr 1995. 73p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010939. Source: OSTI; NTIS; INIS; GPO Dep.

The Multi-Function Waste Tank Facility (MWTF) consists of six 1.1 6 million on underground double-shell waste storage tanks and associated systems. Four of the tanks will be located approximately 2,000 feet west of the western boundary of the 200-East Area of the Hanford Site; two tanks will be located in the southeast corner of the 200-West Area. These tanks will provide storage of mixed hazardous waste. Revision 0 of this report was completed in July of 1993. Since that time, the design of the tanks has changed to using carbon steel for the primary tank and secondary liner (ref 1) in lieu of stainless steel. This means that the primary tank will require postwe d heat treatment (PWHT) at a temperature of 1100°F. In addition, scoping calculations of the temperature distributions in the supporting pad indicate that pad insulating properties have a significant effect on the temperatures experienced by the piping embedded in the pad and the concrete foundation slab during PWHT. Each double-shell tank will be comprised of two main structures: an outer structure made of reinforced concrete and lined with a carbon steel secondary liner, and an inner primary storage tank that is a completely enclosed carbon steel ASME Section III vessel. An annular space will separate the carbon steel secondary liner from the primary storage tank. An insulating/supporting pad will be placed between the bottom of the secondary liner and the bottom of the primary storage tank. The existing double-shell tanks at the Hanford Site were constructed with an insulating castable refractory material at this location. This refractory material was used to protect the tank foundation from the high temperatures produced during the PWHT operation for the carbon steel primary storage tanks. This letter report provides the basis for material selection for the insulating/supporting pad to be used on this project.

20873 (WHC-SD-W236A-ER–021-Rev.1) **Multi-Function Waste Tank Facility phase out basis. Revision 1.** Awadalla, N.G. Westinghouse Hanford Co., Richland, WA (United States). 20 Apr 1995. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011544. Source: OSTI; NTIS; INIS; GPO Dep.

Additional double-shell tank storage capacity is not needed until FY 2004 or later. The waste volume in the current baseline program can be managed within the existing tank capacity. However, this requires implementation of some risk management actions and significant investment in software and hardware to accomplish the actions necessary to maximize use of existing storage tank space."

20874 (WHC-SD-W236A-ER–022) **Using tank 107-AN caustic addition for confirmation of mixing scale relationship.** Chang, S.C. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012792. Source: OSTI; NTIS; INIS; GPO Dep.

A subscale jet mixing program was carried out in two scale tanks to extend the basis of previous subscale tests to include in-tank geometry associated with tank AN-107. The laboratory data will be correlated with the data to be collected in the upcoming tank AN-107 mixing and caustic addition test. The objective is to verify the scaling relationship used in the MWTF mixer design.

20875 (WHC-SD-W236A-ES–015) **Waste segregation analysis for salt well pumping in the 200 W Area – Task 3.4.** Reynolds, D.A. Westinghouse Hanford Co., Richland, WA (United States). 28 Apr 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011676. Source: OSTI; NTIS; INIS; GPO Dep.

There is an estimated 7 million liters (1.9 million gallons) of potentially complexed waste that need to be pumped from single-shell tanks (SST) in the 200 West Area. This represents up to 40% of the salt well liquor that needs to be pumped in the 200 West Area. There are three double-shell (DST) tanks in the 241-SY tank farm in the 200 West Area. Tank 241-SY-101 is full and not usable. Tank 241-SY-102 has a transuranic (TRU) sludge in the bottom. Current rules prohibit mixing complexed waste with TRU waste. Tank 241-SY-103 has three major problems. First, 241-SY-103 is on the Flammable Watch list. Second, adding waste to tank 241-SY-103 has the potential for an episodic release of hydrogen gas. Third, 241-SY-103 will not hold all of the potentially complexed waste from the SSTs. This document looks at more details regarding the salt well pumping of the 200 West Area tank farm. Some options are considered but it is beyond the scope of this document to provide an in-depth study necessary to provide a defensible solution to the complexed waste problem.

20876 (WHC-SD-W236A-TI–020) **Position paper: Seismic design criteria.** Farnworth, S.K. Westinghouse Hanford Co., Richland, WA (United States). 22 May 1995. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013338. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this paper is to document the seismic design criteria to be used on the Title 11 design of the underground double-shell waste storage tanks and appurtenant facilities of the Multi-Function Waste Tank Facility (MWTF) project, and to provide the history and methodologies for determining the recommended Design Basis Earthquake (DBE) Peak Ground Acceleration (PGA) anchors for site-specific seismic response spectra curves. Response spectra curves for use in design are provided in Appendix A.

20877 (WHC-SD-W236A-TS–001) **Project W-236A multi-function waste tank facility waste feed projections.** Larrick, A.P. Westinghouse Hanford Co., Richland, WA (United States). 22 Dec 1994. 61p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006597. Source: OSTI; NTIS; INIS; GPO Dep.

A review of Hanford Underground Waste Storage Tank Chemistry, coupled with planned remediation actions and retrieval sequences was conducted in order to predict the chemistry of the waste to be stored in the MWTF tanks. All projected waste solutions to be transferred to the MWTF tanks were found to be in compliance with current tank chemistry specifications; therefore, the waste and the tank materials of construction are expected to be compatible.

20878 (WHC-SD-W320-DA–007) **Structural analysis of the Heel Jet secondary catch mechanism.** Coverdell, B.L. Westinghouse Hanford Co., Richland, WA (United States). 17 Apr 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010573. Source: OSTI; NTIS; INIS; GPO Dep.

Studies of the Heel Jet Pump lifting bail weld indicate that the weld process and/or weld material used may be incompatible with the base metal. For this reason, a backup design for hoist of the Heel Jet Pump is necessary. By using a 0.0508 m (2 in.) and 0.0762 m (3 in.) jumper connector in conjunction with the existing lifting bail the Heel Jet Pump can be safely hoisted.

20879 (WHC-SD-W378-DRD–001) **Preliminary design requirements document for Project W-378, low-level waste vitrification plant.** Swanson, L.M. Westinghouse Hanford Co., Richland, WA (United States). 31 Mar 1995. 106p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010676. Source: OSTI; NTIS; INIS; GPO Dep.

The scope of this preliminary Design Requirements Document (DRD) is to identify and define the functions, with associated requirements, which must be performed to accomplish vitrification and disposal of the pretreated low-level waste (LLW) fraction of the Hanford Site tank waste. This document sets forth function requirements, performance requirements and design constraints necessary to begin conceptual design for the Low-Level Waste Vitrification Plant (LLWVP). System and physical interfaces between the LLWVP Project and the Tank Waste Remediation System (TWRS) are identified. The constraints, performance requirements, and transfer of information and data across a technical interface will be documented in an Interface Control Document. The design requirements provided in this document will be augmented by additional detailed design data to be documented by the project.

20880 (WHC-SD-W430-FDC–001) **Functional design criteria SY tank farm cathodic protection, 95G-EWW-430.** Edgemon, G.L. Westinghouse Hanford Co., Richland, WA (United States). 13 Apr 1995. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012794. Source: OSTI; NTIS; INIS; GPO Dep.

Functional Design Criteria (FDC) for Project W-430 describing cathodic protection system completion in 241-SY tank farm.

20881 (WHC-SD-WM-ATP–077-Rev.3) **Enraf series 854 Advanced Technology Gauge (ATG) acceptance test procedure. Revision 3.** Barnes, G.A. Westinghouse Hanford Co., Richland, WA (United States). 8 May 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012826. Source: OSTI; NTIS; INIS; GPO Dep.

This procedure provides acceptance testing for Enraf Series 854 level gauges used to monitor levels in Hanford Waste Storage Tanks. The test will verify that the gauge functions according to the manufacturer's instructions and specifications and is properly setup prior to being delivered to the tank farm area.

20882 (WHC-SD-WM-ATP–128) **Operator coil monitoring Acceptance Test Procedure.** Erhart, M.F. Westinghouse Hanford Co., Richland, WA (United States). 16 May 1995. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013362. Source: OSTI; NTIS; INIS; GPO Dep.

The readiness of the Data Acquisition and Control System (DACS) to provide monitoring and control of the Programmable Logic Controller (PLC) abort coils from the Master and RSS stations will be systematically tested during performance of this procedure. It should be noted that these are not physical abort coils but software coils controlled by the software's ladder logic. The readiness of the DACS to properly interface with the ENRAF wire level gauge installed in the SY-101 storage tank will also be tested. During this test, a verification of all abort coil indications will be conducted at the DACS Development Facility in the 306E Building by injecting an input signal for each DACS sensor that has an associated abort coil until the abort coil actuates, and then ensuring that the status of the abort coil indicated at the Master and RSS stations is correct. Each abort coil will also be tested to ensure that the "ENABLE" and "DISABLE" controls from the Master and RSS stations function correctly, and only with the use of proper passwords.

20883 (WHC-SD-WM-ATR–090) **Standard-B auto grab sampler hydrogen monitoring system, Acceptance Test Report.** Lott, D.T. Westinghouse Hanford Co., Richland, WA (United States). 18 May 1995. 799p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013364. Source: OSTI; NTIS; INIS; GPO Dep.

Project W-369, Watch List Tank Hydrogen Monitors, installed a Standard-C Hydrogen Monitoring System (SHMS) on the Flammable gas waste tank AN-104. General Support Projects (8K510) was support by Test Engineering (7CH30) in the performance of the Acceptance Test Procedures (ATP) to qualify the SHMS cabinets on the waste tank. The ATP's performance was controlled by Tank Farm work package. This completed ATP is transmitted by EDT-601748 as an Acceptance Test Report (ATR) in accordance with WHC-6-1, EP 4.2 and EP 1.12.

20884 (WHC-SD-WM-ATR–129) **Void fraction instrument software, Version 1,2, Acceptance test report.** Gimera, M. Westinghouse Hanford Co., Richland, WA (United States). 9 May 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013328. Source: OSTI; NTIS; INIS; GPO Dep.

This provides the report for the void fraction instrument acceptance test software Version 1.2. The void fraction will collect data that will be used to calculate the quantity of gas trapped in waste tanks.

20885 (WHC-SD-WM-ATR–130) **Viscometer software, Version 1.1, Acceptance test report.** Gimera, M. Westinghouse Hanford Co., Richland, WA (United States). 9 May 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013327. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents results of the acceptance test for the software that was developed to operate the viscometer, which is the instrument that will collect ball rheometry data for Tank 101-SY.

20886 (WHC-SD-WM-DP–104) **45-Day safety screen results for Tank 241-BY-103, auger samples 95-AUG-012 and 95-AUG-013.** Schreiber, R.D. Westinghouse Hanford Co., Richland, WA (United States). 21 Apr 1995. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011448. Source: OSTI; NTIS; INIS; GPO Dep.

Two auger samples from tank 241-BY-103 (BY-103) were received by the 222-S Laboratories and underwent safety screening analysis, consisting of differential scanning calorimetry (DSC), thermogravimetric analysis (TGA), and total alpha activity. Analytical results for the TGA analyses for both samples were less than the safety screening notification limit. Since notification is made if the sample is analyzed at less than 17% water, notification was made on April 20, 1995. Although the sample results were below this limit, no secondary analyses were required or performed. Included in this report are the primary safety screening results obtained from the analyses and copies of all DSC and TGA raw data scans as requested per the TCP. Photographs of the auger samples were taken during extrusion and, although not included in this report, are available. Tank BY-103 is on the ferrocyanide Watch List.

20887 (WHC-SD-WM-DP–108) **45-Day safety screen results for tank 241-C-105, push mode, cores 72 and 76.** Sasaki, L.M. Westinghouse Hanford Co., Richland, WA (United States). 3 May 1995. 127p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012834. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a report of the analytical results for samples collected between March 14 and March 22, 1995 from the radioactive wastes in Tank 241-C-105 at the Hanford Reservation. Core samples were collected from the solid wastes in the tank and underwent safety screening analyses including differential scanning calorimetry, thermogravimetric analysis, and total alpha analysis.

20888 (WHC-SD-WM-DP–109) **45-Day safety screen results for tank 241-U-203, push mode, cores 79 and 80.** Schreiber,

R.D. Westinghouse Hanford Co., Richland, WA (United States). 5 May 1995. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012837. Source: OSTI; NTIS; INIS; GPO Dep.

Two one-segment core samples from tank 241-U-203 (U-203) were received by the 222-S Laboratories and underwent safety screening analysis, consisting of differential scanning calorimetry (DSC), thermogravimetric analysis (TGA), and total alpha activity. In addition to the safety screening requirements, inductively coupled plasma (ICP) spectrographic analysis for lithium was performed to determine the extent of hydrostatic head fluid contamination during the sampling event. No notification limits were exceeded for these analyses.

20889 (WHC-SD-WM-DP–110) **45-Day safety screen results for tank 241-U-202, push mode, cores 75 and 78.** Jo, J. Westinghouse Hanford Co., Richland, WA (United States). 5 May 1995. 106p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012833. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a report of the analytical results for samples collected from the radioactive wastes in Tank 241-U-202 at the Hanford Reservation. Core samples were collected from the solid wastes in the tank and underwent safety screening analyses including differential scanning calorimetry, thermogravimetric analysis, and total alpha analysis. Results indicate that no safety screening notification limits were exceeded.

20890 (WHC-SD-WM-DP–112) **45-day safety screen results and final report for Tank 241-C-203, Auger samples 95 AUG-020 and 95-AUG-021.** Conner, J.M. Westinghouse Hanford Co., Richland, WA (United States). 18 May 1995. 90p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013365. Source: OSTI; NTIS; INIS; GPO Dep.

This document serves as the 45-day report deliverable for the tank C-203 auger samples collected on April 5, 1995 (samples 95-AUG-20 and 95-AUG-021). As no secondary analyses were required and no other analyses have been requested, this document also serves as the final report for C-203 auger sampling. Each sample was received, extruded, and analyzed by the 222-S Laboratories in accordance with the Tank Characterization Plan (TCP) referenced below. Included in this report are the primary safety screening results (DSC, TGA, and alpha) and density results. The worklists and raw data are included in this report. Photographs of the auger samples were taken during extrusion and, although not included in this report, are available.

20891 (WHC-SD-WM-DP–113) **45-day safety screen results for tank 241-U-204, push mode, cores 81 and 82.** Bell, K.E. Westinghouse Hanford Co., Richland, WA (United States). 17 May 1995. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013346. Source: OSTI; NTIS; INIS; GPO Dep.

This is the 45-Day report for the fiscal year 1995 tank 241-U-204 (U-204) push-mode characterization effort. Included are a summary of analytical results and copies of the differential scanning calorimetry (DSC) and thermogravimetric analysis (TGA) scans. Core samples 81 and 82 from tank U-204, obtained by the push-mode core sampling method, were received by the 222-S Laboratories. Each core consisted of only one segment. Both core samples and the field blank were extruded, subsampled, and analyzed in accordance with Reference 1. Drainable liquids and the field blank were analyzed at the segment level for energetics by DSC, percent water by TGA, and total organic carbon (TOC) by furnace oxidation. In addition, the presence or absence of any separable, presumably organic, layer in drainable liquid samples was noted and none was observed. The solids were analyzed directly at the half segment level for energetics by DSC, percent water by TGA, and TOC by persulfate oxidation. Total alpha activity was determined on fusion digestions of the sludge subsamples. No immediate notifications were necessary on samples from cores 81 or 82.

20892 (WHC-SD-WM-DP–130) **Equipment sizing calculations for the Extensive Separations Alternative engineering data package.** Jansen, G. Jr. Westinghouse Hanford Co., Richland, WA (United States). 6 Apr 1995. 383p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010945. Source: OSTI; NTIS; INIS; GPO Dep.

This document contains results of Raytheon/BNFL calculations for equipment selection and sizing for the Extensive Separations Alternative to be evaluated in the TWRS- (Tank Waste Remediation System) Environmental Impact Statement. This report contains: an equipment list for the extensive separations/HLW Facility; calculation of equipment sizing for HLW vitrification system; calculation for centrifuge selection; calculation of equipment sizing for fractionator, absorbers, reboiler, and condenser; calculation of equipment sizing for ion exchange columns; calculation of equipment sizing for tanks; calculation of equipment sizing for bulk, preparation, and feed cold chemical tanks; calculation of equipment sizing for evaporators, condensers, tanks, decanters, and filters; calculation of equipment sizing for organics destruction system; and calculation of LLW facility throughput and equipment sizes.

20893 (WHC-SD-WM-DQO–002-Rev.1) **Data quality objectives for generic in-tank health and safety vapor issue resolution. Revision 1.** Osborne, J.W. Westinghouse Hanford Co., Richland, WA (United States). 28 Apr 1995. 83p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012797. Source: OSTI; NTIS; INIS; GPO Dep.

Data Quality Objectives (DQOs) for generic waste storage tank vapor and gas sampling were developed in facilitated meetings and a stakeholder review session, using the most recent US EPA DQO guidelines. These meetings elicited DQOs for two major vapor problem areas: flammability and toxicity. This is a summary of the outputs of the planning team for each of the 7 steps of the DQO process.

20894 (WHC-SD-WM-DQO–006-Rev.1) **Data quality objective to support resolution of the organic fuel rich tank safety issue.** Buckley, L.L. Westinghouse Hanford Co., Richland, WA (United States). 28 Apr 1995. 95p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011633. Source: OSTI; NTIS; INIS; GPO Dep.

During years of Hanford process history, large quantities of complexants used in waste management operations as well as an unknown quantity of degradation products of the solvents used in fuel reprocessing and metal recovery were added to man of the 149 single-shell tanks. These waste tanks also contain a presumed stoichiometric excess of sodium nitrate/nitrite oxidizers, sufficient to exothermically oxidize the organic compounds if suitably initiated. This DQO identifies the questions that must be answered to appropriately disposition organic watchlist tanks, identifies a strategy to deal with false positive or negative judgements associated with analytical uncertainty, and list the analytes of concern to support dealing with organic watchlist concerns. Uncertainties associated with both assay limitations and matrix effects complicate selection of analytes. This results in requiring at least two independent measures of potential fuel reactivity.

20895 (WHC-SD-WM-DQO–007-Rev.1) **Data requirements for the Ferrocyanide Safety Issue developed through the data quality objectives process. Revision 1.** Meacham, J.E.; Cash, R.J. Westinghouse Hanford Co., Richland, WA (United States). 28 Apr 1995. 78p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012787. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides the requirements for obtaining tank characterization information to support resolution of the Ferrocyanide Safety Issue at the Hanford Site by applying the data quality objectives (DQO) process. A strategy describing the overall approach to safe storage and disposal of the waste in the ferrocyanide tanks identifies the problems and decisions that require characterization data. The DQO process is applied to each decision or group of related decisions to specify data requirements.

20896 (WHC-SD-WM-DQO–018) **Historical model evaluation data requirements.** Simpson, B.C.; McCain, D.J. Westinghouse Hanford Co., Richland, WA (United States). 8 May 1995. 22p. Sponsored by USDOE, Washington, DC (United

States). DOE Contract AC06-87RL10930. Order Number DE95012827. Source: OSTI; NTIS; INIS; GPO Dep.

Several studies about tank waste contents have been published using historical records of tank transactions and various analytical measurements. While these records offer a wealth of information, the results are questionable until error estimates associated with the results can be established. However, they do provide a direction for investigation. Two principal observations from the studies are: (1) Large quantities of individual waste types from the various separations processes were widely distributed throughout the tank farms, and (2) The compositions of many of these waste types are quite distinct from one another. A key assumption associated with these observations is that the effects of time and location on the tank wastes are either nominal or not discernable. Since each waste type has a distinct composition, it would benefit all programs to better quantify that composition, and establish an uncertainty for each element of that composition. Various process, disposal, or other decisions could then be made based on current information reducing the need for extended sampling and analysis.

20897 (WHC-SD-WM-ER-400-Vol.1) **Tank waste source term inventory validation. Volume 1. Letter report.** Brevick, C.H.; Gaddis, L.A.; Johnson, E.D. ICF Kaiser Hanford Co., Richland, WA (United States). 28 Apr 1995. 505p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012488. Source: OSTI; NTIS; INIS; GPO Dep.

The sample data for selection of 11 radionuclides and 24 chemical analytes were extracted from six separate sample data sets, were arranged in a tabular format and were plotted on scatter plots for all of the 149 single-shell tanks, the 24 double-shell tanks and the four aging waste tanks. The solid and liquid sample data was placed in separate tables and plots. The sample data and plots were compiled from the following data sets: characterization raw sample data, recent core samples, D. Braun data base, Wastren (Van Vleet) data base, TRAC and HTCE inventories. This document is Volume I of the Letter Report entitled Tank Waste Source Term Inventory Validation.

20898 (WHC-SD-WM-ER-400-Vol.2) **Tank waste source term inventory validation. Volume II. Letter report.** ICF Kaiser Hanford Co., Richland, WA (United States). Apr 1995. 880p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012489. Source: OSTI; NTIS; INIS; GPO Dep.

This document comprises Volume II of the Letter Report entitled Tank Waste Source Term Inventory Validation. This volume contains Appendix C, Radionuclide Tables, and Appendix D, Chemical Analyte Tables. The sample data for selection of 11 radionuclides and 24 chemical analytes were extracted from six separate sample data sets, were arranged in a tabular format and were plotted on scatter plots for all of the 149 single-shell tanks, the 24 double-shell tanks and the four aging waste tanks. The solid and liquid sample data was placed in separate tables and plots. The sample data and plots were compiled from the following data sets: characterization raw sample data, recent core samples, D. Braun data base, Wastren (Van Vleet) data base, TRAC and HTCE inventories.

20899 (WHC-SD-WM-ER-418-Rev.1) **Tank 241-BY-104 vapor sampling and analysis tank characterization report. Revision 1.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013567. Source: OSTI; NTIS; INIS; GPO Dep.

Tank 241-BY-104 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. The drivers and objectives of waste tank headspace sampling and analysis are discussed in "Program Plan for the Resolution of Tank Vapor Issues." Tank 241-BY-104 was vapor sampled in accordance with "Data Quality Objectives for Generic In-Tank Health and Safety Issue Resolution."

20900 (WHC-SD-WM-ER-419-Rev.1) **Tank 241-BY-105 vapor sampling and analysis tank characterization report. Revision 1.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013566. Source: OSTI; NTIS; INIS; GPO Dep.

Tank 241-BY-105 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. The drivers and objectives of waste tank headspace sampling and analysis are discussed in "Program Plan for the Resolution of Tank Vapor Issues." Tank 241-BY-105 was vapor sampled in accordance with "Data Quality Objectives for Generic In-Tank Health and Safety Issue Resolution."

20901 (WHC-SD-WM-ER-420-Rev.1) **Tank 241-BY-106 vapor sampling and analysis tank characterization report. Revision 1.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013595. Source: OSTI; NTIS; INIS; GPO Dep.

Tank 241-BY-106 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. The drivers and objectives of waste tank headspace sampling and analysis are discussed in "Program Plan for the Resolution of Tank Vapor Issues." Tank 241-BY-106 was vapor sampled in accordance with "Data Quality Objectives for Generic In-Tank Health and Safety Issue Resolution."

20902 (WHC-SD-WM-ER-421) **Tank 241-BY-107 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 5 May 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012831. Source: OSTI; NTIS; INIS; GPO Dep.

Tank 241-BY-107 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. The drivers and objectives of waste tank headspace sampling and analysis are discussed in "Program Plan for the Resolution of Tank Vapor Issues". Tank 241-BY-107 was vapor sampled in accordance with "Data Quality Objectives for Generic In-Tank Health and Safety Issue Resolution".

20903 (WHC-SD-WM-ER-421-Rev.1) **Tank 241-BY-107 vapor sampling and analysis tank characterization report. Revision 1.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013594. Source: OSTI; NTIS; INIS; GPO Dep.

Tank 241-BY-107 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. The drivers and objectives of waste tank headspace sampling and analysis are discussed in "Program Plan for the Resolution of Tank Vapor Issues." Tank 241-BY-107 was vapor sampled in accordance with "Data Quality Objectives for Generic In-Tank Health and Safety Issue Resolution."

20904 (WHC-SD-WM-ER-422-Rev.1) **Tank 241-BY-108 vapor sampling and analysis tank characterization report. Revision 1.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014304. Source: OSTI; NTIS; INIS; GPO Dep.

Tank 241-BY-108 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. The drivers and objectives of waste tank headspace sampling and analysis are discussed in "Program Plan for the Resolution of Tank Vapor Issues" (Osborne and Huckaby 1994). Tank 241-BY-108 was vapor sampled in accordance with "Data Quality Objectives for Generic In-Tank Health and Safety Issue Resolution (Osborne et al., 1994).

20905 (WHC-SD-WM-ER-423) **Tank 241-C-108 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 5 May 1995. 16p. Sponsored by USDOE, Washington, DC (United

States). DOE Contract AC06-87RL10930. Order Number DE95012832. Source: OSTI; NTIS; INIS; GPO Dep.

Tank 241-C-108 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. The drivers and objectives of waste tank headspace sampling and analysis are discussed in Program Plan for the Resolution of Tank Vapor Issues (Osborne and Huckaby 1994). Tank 241-C-108 was vapor sampled in accordance with Data Quality Objectives for Generic In-Tank Health and Safety Issue Resolution (Osborne et al., 1994).

20906 (WHC-SD-WM-ER–423-Rev.1) **Tank 241-C-108 vapor sampling and analysis tank characterization report. Revision 1.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013569. Source: OSTI; NTIS; INIS; GPO Dep.

Tank 241-C-108 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. The drivers and objectives of waste tank headspace sampling and analysis are discussed in "Program Plan for the Resolution of Tank Vapor Issues." Tank 241-C-108 was vapor sampled in accordance with "Data Quality Objectives for Generic In-Tank Health and Safety Issue Resolution."

20907 (WHC-SD-WM-ER–424) **Tank 241-C-109 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 10 May 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012830. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the Hanford waste tank characterization study for tank 241-C-109. The drivers and objectives of the headspace vapor sampling and analysis were in accordance with procedures that were presented in other reports. The vapor and headspace gas samples were collected and analyzed to determine the potential risks to tank farm workers due to fugitive emissions from the tank.

20908 (WHC-SD-WM-ER–424-Rev.1) **Tank 241-C-109 vapor sampling and analysis tank characterization report. Revision 1.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013561. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the Hanford waste tank characterization study for tank C-109. The drivers and objectives of the waste tank headspace vapor sampling and analysis were in accordance with procedures that were presented in other reports.

20909 (WHC-SD-WM-ER–425-Rev.1) **Tank 241-C-111 vapor sampling and analysis tank characterization report. Revision 1.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013559. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the Hanford waste tank characterization study for tank 241-C-111. The drivers and objectives of the headspace vapor sampling and analysis were in accordance with procedures that were presented in other reports. The vapor and headspace gas samples were collected and analyzed to determine the potential risks to tank farm workers due to fugitive emissions from the tank.

20910 (WHC-SD-WM-ER–426-Rev.1) **Tank 241-C-112 vapor sampling and analysis tank characterization report. Revision 1.** Huckaby, J.L. Pacific Northwest Lab., Richland, WA (United States). 31 May 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013565. Source: OSTI; NTIS; INIS; GPO Dep.

Tank 241-C-112 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. The drivers and objectives of waste tank headspace sampling and analysis are discussed in "Program Plan for the Resolution of Tank Vapor Issues." Tank 241-C-112 was vapor sampled in accordance with "Data Quality Objectives for Generic In-Tank Health and Safety Issue Resolution."

20911 (WHC-SD-WM-ER–429-Rev.1) **Tank 241-BY-110 vapor sampling and analysis tank characterization report. Revision 1.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013907. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the Hanford waste tank characterization study for tank 241-BY-110. The drivers and objectives of the headspace vapor sampling and analysis were in accordance with procedures that were presented in other reports. The vapor and headspace gas samples were collected and analyzed to determine the potential risks to the tank farm workers due to fugitive emissions from the tank.

20912 (WHC-SD-WM-ER–434) **Engineering report of plasma vitrification of Hanford tank wastes.** Hendrickson, D.W. Westinghouse Hanford Co., Richland, WA (United States). 12 May 1995. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013324. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides an analysis of vendor-derived testing and technology applicability to full scale glass production from Hanford tank wastes using plasma vitrification. The subject vendor testing and concept was applied in support of the Hanford LLW Vitrification Program, Tank Waste Remediation System.

20913 (WHC-SD-WM-ER–438) **Tank 241-B-103 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013896. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the Hanford waste tank characterization study for tank 241-B-103. The drivers and objectives of the headspace vapor sampling and analysis were in accordance with procedure that were presented in other reports. The vapor and headspace gas samples were collected and analyzed to determine the potential risks to tank farm workers due to fugitive emissions from the tank.

20914 (WHC-SD-WM-ER–439) **Tank 241-BX-104 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013897. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the Hanford waste tank characterization study for tank 241-BX-104. The drivers and objectives of the headspace vapor sampling and analysis were in accordance with procedure that were presented in other reports. The vapor and headspace gas samples were collected and analyzed to determine the potential risks to tank farm workers due to fugitive emissions from the tank.

20915 (WHC-SD-WM-ER–440) **Tank 241-BY-111 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013572. Source: OSTI; NTIS; INIS; GPO Dep.

Tank 241-BY-111 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. The drivers and objectives of waste tank headspace sampling and analysis are discussed in "Program Plan for the Resolution of Tank Vapor Issues." Tank 241-BY-111 was vapor sampled in accordance with "Data Quality Objectives for Generic In-Tank Health and Safety Issue Resolution."

20916 (WHC-SD-WM-ER–441) **Tank 241-BY-112 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May

1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013571. Source: OSTI; NTIS; INIS; GPO Dep.

Tank 241-BY-112 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. The drivers and objectives of waste tank headspace sampling and analysis are discussed in "Program Plan for the Resolution of Tank Vapor Issues." Tank 241-BY-112 was vapor sampled in accordance with "Data Quality Objectives for Generic In-Tank Health and Safety Issue Resolution."

20917 (WHC-SD-WM-ER--442) **Tank 241-C-104 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013597. Source: OSTI; NTIS; INIS; GPO Dep.

Tank 241-C-104 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. The drivers and objectives of waste tank headspace sampling and analysis are discussed in "Program Plan for the Resolution of Tank Vapor Issues." Tank 241-C-104 was vapor sampled in accordance with "Data Quality Objectives for Generic In-Tank Health and Safety Issue Resolution."

20918 (WHC-SD-WM-ER--443) **Tank 241-C-105 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012136. Source: OSTI; INIS; NTIS; GPO Dep.

This report presents the details of the Hanford waste tank characterization study for tank 241-C-105. The drivers and objectives of the headspace vapor sampling and analysis were in accordance with procedures that were presented in other reports. The vapor and headspace gas samples were collected and analyzed to determine the potential risks to tank farm workers due to fugitive emissions from the tank.

20919 (WHC-SD-WM-ER--444) **Tank 241-C-106 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013230. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the Hanford waste tank characterization study for tank 241-C-106. The drivers and objectives of the headspace vapor sampling and analysis were in accordance with procedures that were presented in other reports. The vapor and headspace gas samples were collected and analyzed to determine the potential risks to tank farm workers due to fugitive emissions from the tank.

20920 (WHC-SD-WM-ER--445) **Tank 241-C-107 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015155. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the Hanford waste tank characterization study for tank 241-C-107. The drivers and objectives of the headspace vapor sampling and analysis were in accordance with procedures that were presented in other reports. The vapor and headspace gas samples were collected and analyzed to determine the potential risks to tank farm workers due to fugitive emissions from the tank.

20921 (WHC-SD-WM-ER--446) **Tank 241-S-102 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013596. Source: OSTI; NTIS; INIS; GPO Dep.

Tank 241-S-102 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. The drivers and objectives of waste tank headspace sampling and analysis are discussed in "Program Plan for the Resolution of Tank Vapor Issues." Tank 241-S-102 was vapor sampled in accordance with "Data Quality Objectives for Generic In-Tank Health and Safety Issue Resolution. "

20922 (WHC-SD-WM-ER--447) **Tank 241-T-107 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013895. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the Hanford waste tank characterization study for tank 241-T-107. The drivers and objectives of the headspace vapor sampling and analysis were in accordance with procedure that were presented in other reports. The vapor and headspace gas samples were collected and analyzed to determine the potential risks to tank farm workers due to fugitive emissions from the tank.

20923 (WHC-SD-WM-ER--448) **Tank 241-TX-105 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013568. Source: OSTI; NTIS; INIS; GPO Dep.

Tank 241-TX-105 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. The drivers and objectives of waste tank headspace sampling and analysis are discussed in "Program Plan for the Resolution of Tank Vapor Issues." Tank 241-TX-105 was vapor sampled in accordance with "Data Quality Objectives for Generic In-Tank Health and Safety Issue Resolution."

20924 (WHC-SD-WM-ER--449) **Tank 241-TX-118 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013570. Source: OSTI; NTIS; INIS; GPO Dep.

Tank 241-TX-118 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. The drivers and objectives of waste tank headspace sampling and analysis are discussed in "Program Plan for the Resolution of Tank Vapor Issues." Tank 241-TX-118 was vapor sampled in accordance with "Data Quality Objectives for Generic In-Tank Health and Safety Issue Resolution."

20925 (WHC-SD-WM-ER--451) **Tank 241-U-107 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013578. Source: OSTI; NTIS; INIS; GPO Dep.

Tank 241-U-107 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. The drivers and objectives of waste tank headspace sampling and analysis are discussed in "Program Plan for the Resolution of Tank Vapor Issues." Tank 241-U-107 was vapor sampled in accordance with "Data Quality Objectives for Generic In-Tank Health and Safety Issue Resolution."

20926 (WHC-SD-WM-ER--452) **Tank 241-U-111 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013577. Source: OSTI; NTIS; INIS; GPO Dep.

Tank 241-U-111 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank

farm workers due to fugitive emissions from the tank. The drivers and objectives of waste tank headspace sampling and analysis are discussed in "Program Plan for the Resolution of Tank Vapor Issues." Tank 241-U-111 was vapor sampled in accordance with "Data Quality Objectives for Generic In-Tank Health and Safety Issue Resolution."

20927 (WHC-SD-WM-ER–459) **Tank 241-C-102 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Douglas United Nuclear, Inc., Richland, WA (United States). 31 May 1995. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013562. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the Hanford waste tank characterization study for tank 241-C-102. The drivers and objectives of the headspace vapor sampling and analysis were in accordance with procedures that were presented in other reports. The vapor and headspace gas samples were collected and analyzed to determine the potential risks to tank farm workers due to fugitive emissions from the tank.

20928 (WHC-SD-WM-ER–460) **Tank 241-SX-106 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013903. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the Hanford waste tank characterization study for tank 241-SX-106. The drivers and objectives of the headspace vapor sampling and analysis were in accordance with procedure that were presented in other reports. The vapor and headspace gas samples were collected and analyzed to determine the potential risks to tank farm workers due to fugitive emissions from the tank.

20929 (WHC-SD-WM-ER–461) **Tank 241-TY-101 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013902. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the Hanford waste tank characterization study for tank 241-TY-101. The drivers and objectives of the headspace vapor sampling and analysis were in accordance with procedure that were presented in other reports. The vapor and headspace gas samples were collected and analyzed to determine the potential risks to tank farm workers due to fugitive emissions from the tank.

20930 (WHC-SD-WM-ER–462) **Tank 241-TY-103 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013898. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the Hanford waste tank characterization study for tank 241-TY-103. The drivers and objectives of the headspace vapor sampling and analysis were in accordance with procedure that were presented in other reports. The vapor and headspace gas samples were collected and analyzed to determine the potential risks to tank farm workers due to fugitive emissions from the tank.

20931 (WHC-SD-WM-ER–463) **Tank 241-TY-104 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013560. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the Hanford waste tank characterization study for tank 241-TY-104. The drivers and objectives of the headspace vapor sampling and analysis were in accordance with procedures that were presented in other reports. The vapor and headspace gas samples were collected and analyzed to determine the potential risks to tank farm workers due to fugitive emissions from the tank.

20932 (WHC-SD-WM-ER–464) **Tank 241-C-110 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013894. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the Hanford waste tank characterization study for tank 241-C-110. The drivers and objectives of the headspace vapor sampling and analysis were in accordance with procedure that were presented in other reports. The vapor and headspace gas samples were collected and analyzed to determine the potential risks to tank farm workers due to fugitive emissions from the tank.

20933 (WHC-SD-WM-ES–283-Vol.2) **Long-term decontamination engineering study: Appendix A, Appendix B, Appendix C, Appendix D. Volume 2.** Westinghouse Hanford Co., Richland, WA (United States). [1995]. 400p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010931. Source: OSTI; NTIS; INIS; GPO Dep.

This document contains Appendix A,B,C, and D for the Long-Term Decontamination Study and is a compilation of presentations, draft documents, and supporting documents compiled by the Westinghouse Hanford Company T Plant Systems Engineering Team (TPSET). This information was not formally approved, but provides insight into understanding the uncertainty associated with waste stream projections, facility evaluations, and possible alternatives for decontamination/treatment. This information was used in developing and refining the decontamination/treatment alternatives considered in this study.

20934 (WHC-SD-WM-ETP–109) **Pump strongback redesign, pump storage, PM procedures.** Leshikar, G.A.; Desantis, N. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010594. Source: OSTI; NTIS; INIS; GPO Dep.

This Engineering Task Plan describes the requirement for the fabrication of the safety latch, pump PM procedures and spare parts acquisitions.

20935 (WHC-SD-WM-ETP–152) **Engineering Task Plan for Tank 241-C-106 contingency chiller definitive design.** Rensink, G.E.; Kriskovich, J.R. Westinghouse Hanford Co., Richland, WA (United States). 22 May 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013363. Source: OSTI; NTIS; INIS; GPO Dep.

This document identifies the scope, cost, schedule and responsible organizations for completing a design of a contingency ventilation inlet air cooling system for Tank 241-C-106. The air cooling system, described in Rensink (1995), consists of a chiller, cooling coils, and supporting equipment that, when installed will be capable of assuring that the waste temperatures in Tank 241-C-106 are maintained within acceptable limits for safe storage. The effort described herein is scheduled for completion by May 31, 1995 to support Performance Based Incentive (PBI) Milestone SI-2x.

20936 (WHC-SD-WM-FRD–018) **Functional design criteria for the retained gas sampler system.** Wootan, D.W. Westinghouse Hanford Co., Richland, WA (United States). 12 Apr 1995. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011449. Source: OSTI; NTIS; INIS; GPO Dep.

A Retained Gas Sampler System (RGSS) is being developed to capture and analyze waste samples from Hanford Flammable Gas Watch List Tanks to determine both the quantity and composition of gases retained in the waste. The RGSS consists of three main components: the Sampler, Extractor, and Extruder. This report describes the functional criteria for the design of the RGSS components. The RGSS Sampler is based on the WHC Universal Sampler design with modifications to eliminate gas leakage. The primary function of the Sampler is to capture a representative waste sample from a tank and transport the sample with minimal loss of gas content from the tank to the laboratory. The function of the Extruder is to transfer the waste sample from the Sampler to the Extractor.

The function of the Extractor is to separate the gases from the liquids and solids, measure the relative volume of gas to determine the void fraction, and remove and analyze the gas constituents.

20937 (WHC-SD-WM-ISB–007) **Central waste complex interim safety basis.** Cain, F.G. Westinghouse Hanford Co., Richland, WA (United States). 15 May 1995. 129p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013331. Source: OSTI; NTIS; INIS; GPO Dep.

This interim safety basis provides the necessary information to conclude that hazards at the Central Waste Complex are controlled and that current and planned activities at the CWC can be conducted safely. CWC is a multi-facility complex within the Solid Waste Management Complex that receives and stores most of the solid wastes generated and received at the Hanford Site. The solid wastes that will be handled at CWC include both currently stored and newly generated low-level waste, low-level mixed waste, contact-handled transuranic, and contact-handled TRU mixed waste.

20938 (WHC-SD-WM-MAR–006) **B plant mission analysis report.** Lund, D.P. Westinghouse Hanford Co., Richland, WA (United States). 24 May 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013901. Source: OSTI; NTIS; INIS; GPO Dep.

This report further develops the mission for B Plant originally defined in WHC-EP-0722, "System Engineering Functions and Requirements for the Hanford Cleanup Mission: First Issue." The B Plant mission analysis will be the basis for a functional analysis that breaks down the B Plant mission statement into the necessary activities to accomplish the mission. These activities are the product of the functional analysis and will then be used in subsequent steps of the systems engineering process, such as identifying requirements and allocating those requirements to B Plant functions. The information in this mission analysis and the functional and requirements analysis are a part of the B Plant technical baseline.

20939 (WHC-SD-WM-OTP–176) **Operability test procedure for the Rotary Mode Core Sampling System Exhausters 3 and 4.** WSaldo, E.J. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013563. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides a procedure for performing operability testing of the Rotary Mode Core Sampling System Exhausters 3 & 4. Upon completion of testing activities an operability testing report will be issued.

20940 (WHC-SD-WM-OTR–171) **Operability test report for the TK-900 effluent monitoring station.** Weissenfels, R.D. Westinghouse Hanford Co., Richland, WA (United States). 6 Apr 1995. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010595. Source: OSTI; NTIS; INIS; GPO Dep.

This operability test report provides the results of the operability test performed on the TK-900 liquid effluent collection system, installed near the east end of the 6 inch chemical sewer header, by Project W-007H. The system is part of BAT/AKART for the BCE liquid effluent stream.

20941 (WHC-SD-WM-PAP–062) **Statements of work for FY 1995 to 2000.** Mann, F.M. Westinghouse Hanford Co., Richland, WA (United States). 26 Apr 1995. 209p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011508. Source: OSTI; NTIS; INIS; GPO Dep.

The activities and tasks needed to successfully prepare an interim, preliminary, and final performance assessment on the disposal of the low-level fraction of Hanford tank wastes are given. Included are analytic, experimental, computational, writing, and approval tasks. These statements of work will be revised annually.

20942 (WHC-SD-WM-RPT–099-Rev.2) **Compliance matrix for the mixed waste disposal facilities, trenches 31 and 34, burial ground 218-W-5. Revision 2.** Johnson, K.D. Westinghouse Hanford Co., Richland, WA (United States). 3 May 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012587. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides a listing of applicable regulatory requirements to the Mixed Waste Disposal trenches. After the listing of regulations to be followed is a listing of documents that show how the regulations are being implemented and followed for the Mixed Waste trenches.

20943 (WHC-SD-WM-SDD–056) **System design description for the HMT Rotation Motor Heater System.** Vargo, G.F. Jr. Westinghouse Hanford Co., Richland, WA (United States). 18 May 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013339. Source: OSTI; NTIS; INIS; GPO Dep.

This document is the design description for the Rotation Motor Heater System on waste tank 241-SY-101. The description includes the certified vendor (CV) file number, operators instructions, and heater sizing calculations.

20944 (WHC-SD-WM-SP–006-Rev.1) **Testing and development strategy for the tank waste remediation system.** Reddick, G.W. Westinghouse Hanford Co., Richland, WA (United States). 10 May 1995. 99p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012829. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides a strategy for performing radioactive (hot) and nonradioactive testing to support processing tank waste. It evaluates the need for hot pilot plant(s) to support pretreatment and other processing functions and presents a strategy for performing hot test work. A strategy also is provided for nonradioactive process and equipment testing. The testing strategy supports design, construction, startup, and operation of Tank Waste Remediation System (TWRS) facilities.

20945 (WHC-SD-WM-TI–690) **Waste volume reduction factors for potential 242-A evaporator feed.** Sederburg, J.P. Westinghouse Hanford Co., Richland, WA (United States). 4 May 1995. 94p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012790. Source: OSTI; NTIS; INIS; GPO Dep.

Double-shell tank (DST) storage space requirements have been shown to be highly dependent on the end point of 242-A operations. Consequences to the DST of various waste volumes, and concentrations, are evaluated. Only waste streams that are currently planned to be stored in the DST system before the year 2004 are discussed. As of January 1, 1995, approximately 27-million L (7.2-million gal) of dilute wastes are stored in the DSTs available for evaporator processing. Waste streams planned to be transferred to the DSTs before December 31, 2004, are identified. The DST volume for storing slurry from these wastes is presented in this document. At a final slurry specific gravity of ~1.35, 22.5-million L (5.93-million gal) of DST space would be needed on December 31, 2004, to store the product from evaporator processing of these feedstocks. The expected volume needed if the resultant slurry were concentrated to the traditional double-shell slurry feed (DSSF) phase boundary (a specific gravity of ~1.5) would be 17.7-million L (4.67-million gal). An additional 4.8-million L (1.26-million gal) is therefore needed if these wastes are concentrated to a specific gravity of 1.35 instead of the DSSF limit.

20946 (WHC-SD-WM-TP–325) **Tank 241-SX-115 tank characterization plan.** Sasaki, L.M. Westinghouse Hanford Co., Richland, WA (United States). 24 Apr 1995. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012835. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a plan which serves as the contractual agreement between the Characterization Project, Sampling Operations, and WHC 222-S Laboratory. The scope of this plan is to provide guidance for the sampling and analysis of samples for tank 241-SX-115.

20947 (WHC-SD-WM-TP–339) **Tank 241-BX-103 tank characterization plan.** Bell, K.E. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); Los Alamos Technical Associates, Inc., Kennewick,

WA (United States). 21 Apr 1995. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011505. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a plan which serves as the contractual agreement between the Characterization Program, Sampling Operations, and WHC 222-S Laboratory. The scope of this plan is to provide guidance for the sampling and analysis of samples for tank 241-BX-103.

20948 (WHC-SD-WM-TP–354) **Tank 241-B-203 tank characterization plan.** Jo, J. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); Los Alamos Technical Associates, Inc., Kennewick, WA (United States). 16 May 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013366. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the tank characterization plan for waste tank 241-B-203. Topics discussed include: data quality objectives, historical information, and tank status.

20949 (WHC-SD-WM-TP–357) **Test plan for auger sampler improvements.** Francis, P.M. Westinghouse Hanford Co., Richland, WA (United States). 27 Apr 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011510. Source: OSTI; NTIS; INIS; GPO Dep.

At Westinghouse Hanford Company (WHC), one of the functions of the Tank Waste Remediation System (TWRS) division is sampling waste tanks to characterize their contents. The recovery performance of the auger sampler has proven inadequate in certain materials. The current auger configuration relies on cohesion and adhesion (properties dependent on sample media) to retain the sample. The media must maintain its form and stick to the auger flights to recover the sample. Recovery has been satisfactory when sampling in wastes with adequate adhesion and shear strength to overcome the forces of gravity and vibrations associated with retrieval. Multiple variations to the auger design will be tested to determine their ability to increase sample recovery and broaden the sampling capabilities. The designs will be tested in two different media, with the recoveries compared to that of a standard auger sampler. Each design modification will be developed and tested using the method described in this test plan.

20950 (WHC-SD-WM-TP–358) **Tank 241-A-102 tank characterization plan.** Jo, J. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); Los Alamos Technical Associates, Inc., Kennewick, WA (United States). 16 May 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013368. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the tank characterization plan for waste tank 241-A-102. Topic discussed include: data quality objectives for sampling, safety screening, tank configuration, historical information, and tank status.

20951 (WHC-SD-WM-TSAP–003) **Tank 241-B-203 Push Mode Core Sampling and Analysis Plan.** Jo, J. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); Los Alamos Technical Associates, Inc., Kennewick, WA (United States). 16 May 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013361. Source: OSTI; NTIS; INIS; GPO Dep.

This Sampling and Analysis Plan (SAP) will identify characterization objectives pertaining to sample collection, laboratory analytical evaluation, and reporting requirements in accordance with the Tank Safety Screening Data Quality Objective (Babad and Redus 1994). This Data Quality Objective (DQO) is described in the Tank Characterization Plan (Jo, 1995) for tank 241-B-203 (B-203). This SAP will also identify procedures and requirements for collecting and characterizing samples from tank B-203 by the core sampling method.

20952 (WHC-SD-WM-TSAP–004) **Tank 241-A-102 auger sampling and analysis plan.** Jo, J. Westinghouse Hanford Co., Richland, WA (United States). 16 May 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013367. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the Hanford waste tank characterization study for tank 241-A-102. The drivers and objectives of the auger sampling and analysis plan were in accordance with procedures that were presented in other reports.

20953 (WHC-SD-WM-UM–030) **ISO-PC Version 1.98: User's guide.** Rittmann, P.D. Westinghouse Hanford Co., Richland, WA (United States). 2 May 1995. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012788. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes how to use Version 1.98 of the shielding program named ISO-PC. Version 1.98 corrects all known errors in ISOSHLD-II. In addition, a few numeric problems have been eliminated. There are three new namelist variables, 25 additional shielding materials, and 5 more energy groups. The two major differences with the original ISOSHLD-II are the removal of RIBD(radioisotope buildup and decay) source generator, and the removal of the non-uniform source distribution parameter, SSV1. This version of ISO-PC works with photon energies from 10 KeV to 10 MeV using 30 energy groups.

20954 (WHC-SD-WM-WP–299) **Work plan for the identification of techniques for in-situ sensing of layering/interfaces of Hanford high level waste tanks.** Vargo, G.F. Jr. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010926. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a plan that describes the activities in a task to conduct an industry survey to determine the existence of currently available hardware and/or concepts for anticipating and/or identifying layering/interfaces within the materials contained in large tanks located on the Hanford Site in Washington State.

20955 (WHC-SP–0969-48) **Site management system executive summary report – March 1995.** Schultz, E.A. Westinghouse Hanford Co., Richland, WA (United States). Mar 1995. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013581. Source: OSTI; NTIS; INIS; GPO Dep.

Performance data for March 1995 reflects a continued unfavorable schedule variance and favorable cost variance. The March fiscal-year-to-date (FYTD) schedule variance is an unfavorable $105.5M. EM-30 (Office of Waste Management) is the biggest contributor ($81.9 million) to the behind-schedule condition. The majority of the EM-30 schedule variance is associated with the Tank Waste Remediation System (TWRS) program. A breakdown of individual program performance is listed on page 6. The TWRS schedule variance totals a negative $63.0 million and is attributed to the delay in receiving key decision 0 (KD-0) for Project W-314, "Tank Farm Restoration and Safe Operations"; the delay in receiving KD-3 for Project W-320, "106-C Sluicing"; late deployment of the rotary and push mode sampling trucks due to equipment and operational issues; late placement of melter contracts; and the Multi-Function Waste Tank Facility (MWTF) workscope still being a part of the baseline. Class I change requests are in process to rebaseline the activities associated with KDs. An aggressive sampling schedule has been developed for the rotary and push mode sampling activity. Thirty-seven enforceable agreement milestones were schedule FYTD. Thirty-six (97 percent) of the thirty-seven were completed on or ahead of schedule and one (3 percent) is delinquent. The Department of Energy, Richland Operations Office entered into dispute resolution on April 7, 1995, for the delinquent milestone. Six (13 percent) of the 39 remaining enforceable agreement milestones scheduled for FY 1995 are forecast to be late. Additional information on these milestones can be found on pages 13 through 15. Performance data reflects a significant favorable $25.7 million (4 percent) cost variance. The majority of the cost variance is attributed to progress towards achievement of productivity commitment goals and is expected to continue for the remainder of this fiscal year.

20956 (WSRC-MS–95-0038) **The effect of chemical composition on the PCT durability of mixed waste glasses from wastewater treatment sludges.** Bickford, D.F. (Westinghouse Savannah River Co., Aiken, SC (United States)); Cicero, C.A.; Resce, J.L.; Ragsdale, R.G.; Overcamp, T.J. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950216–135: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95010967. Source: OSTI; NTIS; INIS; GPO Dep.

TTP/SR132004.

The Mixed Waste Integrated Program (NMIP) at the Department of Energy (DOE) has taken a serious look at vitrification for treatment of low-level mixed waste streams. This was prompted, in part, by the fact that the EPA has declared that vitrification is the Best Demonstrated Available Technology for the disposal of high-level radioactive waste. Among the low-level mixed waste streams within the DOE complex, which are under consideration for vitrification, are wastewater treatment sludges at the Savannah River Site (SRS), Oak Ridge Reservation (ORR), Rocky Flats Plant (RFP), and Los Alamos National Laboratory (LANL), These sludges typically contain low levels of radioactive and hazardous metals, water, and additives from the waste treatment process itself The treatment additives normally include precipitating and flocculating agents such as sodium, calcium, magnesium, and iron compounds or siliceous filter aids from the dewatering process. These treatment additives tend to be soluble in silicate glass and are thus amenable to vitrification.

20957 (WSRC-MS–95-0064) **Vitrification treatability studies of actual waste water treatment sludges.** Jantzen, C.M. (Westinghouse Savannah River Co., Aiken, SC (United States)); Hutson, N.D.; Gilliam, T.M.; Bleier, A.; Spence, R.D. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950216–134: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95010960. Source: OSTI; NTIS; INIS; GPO Dep.

Treatability studies have been conducted at the laboratory-scale to evaluate vitrification of waste water sludges at the Oak Ridge Reservation (ORR). These studies are being conducted jointly by Westinghouse Savannah River Technology Center (SRTC) and Oak Ridge National Laboratory (ORNL). These studies include testing with surrogate waste formulations at both the laboratory-scale and pilot-scale, and testing with actual waste at the laboratory-scale, pilot-scale, and field-scale. ORR was chosen as the host site for the field-scale demonstration. The Y12 West End Treatment Facility (WETF) waste water treatment sludges, which are RCRA F-listed wastes, were chosen as the candidate waste stream for the first field-scale demonstration. The laboratory-scale "proof-of-principle" demonstrations reported in this study and the pilot-scale studies planned for FY95 on the WETF sludge will provide needed operating parameters for the planned field-scale demonstration. These laboratory-scale "proof-of-principle" and pilot-scale studies also provide needed data for the evaluation of the feasibility of vitrification as a stabilization option for a variety of wastes which do not currently meet RCRA/LDR (Resource Conservation and Recovery Act/Land Disposal Restrictions) requirements for storage/disposal and/or those for which treatment capacity does not presently exist.

20958 (WSRC-MS–95-0138) **Design and Fabrication of a Transportable Vitrification System for Mixed Waste Processing.** Whitehouse, J.C. (Westinghouse Savannah River Company, Aiken, SC (United States)); Jantzen, C.M.; Van Ryn, F.R.; Davis, D.H. Westinghouse Savannah River Co., Aiken, SC (United States). 6 Apr 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950877–11: 3. American Society for Mechanical Engineers biannual mixed waste symposium, Baltimore, MD (United States), 7-11 Aug 1995). Order Number DE95060141. Source: OSTI; NTIS; INIS; GPO Dep.

The stabilization and disposal of mixed wastes, which contain both hazardous and radioactive materials, is a significant waste management challenge to the DOE complex.

20959 (WSRC-RP–94-1227-Rev.2) **Investigation-Derived Waste Management Plan. Revision 2.** Molen, G. Westinghouse Savannah River Co., Aiken, SC (United States). 24 May 1995. 77p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060151. Source: OSTI; NTIS; INIS; GPO Dep.

SRS has implemented a comprehensive environmental program to maintain compliance with environmental regulations and mitigate impacts to the environment. One element of the environmental program is the investigation of inactive waste units. Environmental Investigation-Derived Waste (IDW). IDW may include purge water , soil cuttings, drilling fluids, well pumping test and development water, decontamination solutions, contaminated equipment, and personal protection equipment (PPE). In cases where investigations confirm the presence of contamination and the IDW contains waste constituents in concentrations high enough to be of environmental or health concern, special management procedures are warranted. This IDW Management Plan describes specific SRS initiatives for IDW management. The goal is the development of a plan for prudent management of IDW from environmental investigations that is protective of human health and the environment.

20960 (WSRC-TR–92-427-Rev.3) **Safety evaluation of the ITP filter/stripper test runs and quiet time runs using simulant solution. Revision 3.** Gupta, M.K. Westinghouse Savannah River Co., Aiken, SC (United States). Jun 1994. 78p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95014725. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose is to provide the technical bases for the evaluation of Unreviewed Safety Question for the In-Tank Precipitation (ITP) Filter/Stripper Test Runs (Ref. 7) and Quiet Time Runs Program (described in Section 3.6). The Filter/Stripper Test Runs and Quiet Time Runs program involves a 12,000 gallon feed tank containing an agitator, a 4,000 gallon flush tank, a variable speed pump, associated piping and controls, and equipment within both the Filter and the Stripper Building.

20961 (WSRC-TR–93-451-Rev.2) **Pre-title I safety evaluation for the retrieval operations of transuranic waste drums in the Solid Waste Disposal Facility. Revision 2.** Rabin, M.S. Westinghouse Savannah River Co., Aiken, SC (United States). Aug 1992. 81p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95014722. Source: OSTI; NTIS; INIS; GPO Dep.

Phase I of the Transuranic (TRU) Waste Facility Line Item Project includes the retrieval and safe storage of the pad drums that are stored on TRU pads 2-6 in the Solid Waste Disposal Facility (SWDF). Drums containing TRU waste were placed on these pads as early as 1974. The pads, once filled, were mounded with soil. The retrieval activities will include the excavation of the soil, retrieval of the pad drums, placing the drums in overpacks (if necessary) and venting and purging the retrieved drums. Once the drums have been vented and purged, they will be transported to other pads within the SWDF or in a designated area until they are eventually treated as necessary for ultimate shipment to the Waste Isolation Pilot Plant in Carlsbad, New Mexico. This safety evaluation provides a bounding assessment of the radiological risk involved with the drum retrieval activities to the maximally exposed offsite individual and the co-located worker. The results of the analysis indicate that the risk to the maximally exposed offsite individual and the co-located worker using maximum frequencies and maximum consequences are within the acceptance criteria defined in WSRC Procedural Manual 9Q. The purpose of this evaluation is to demonstrate the incremental risk from the SWDF due to the retrieval activities for use as design input only. As design information becomes available, this evaluation can be revised to satisfy the safety analysis requirements of DOE Orders 4700 and 5480.23.

20962 (WSRC-TR–93-508) **Structural analysis of closure cap barriers: A pre-test study for the Bentonite Mat Demonstration Project.** Gong, Chung. Westinghouse Savannah River Co., Aiken, SC (United States). Oct 1993. 93p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95014724. Source: OSTI; NTIS; GPO Dep.

According to the EPA-recommended closure cap design a waste site can either be covered with a single layer cap made of 36

inches of compacted soil (clay) or with a multilayer cap consisting of an upper vegetative layer underlain by a drainage layer over a low permeability layer. The Bentonite Mat Demonstration Project (BMDP) is a field demonstration study to determine the construction/installation requirements, permeability, and subsidence performance characteristics of a composite barrier. The composite barrier will consist of on-site sandy-clay blanketed by a bentonite mat and a flexible High Density Polyethylene (HDPE) liner (also called flexible membrane liner). Construction of one control test pad and three bentonite test pads are planned. The control test pad will be used to establish baseline data. Underneath the composite clay cap is a four-foot loose sand layer in which cavities will be created by evacuation of sand. The present work provides a mathematical model for the BMDP. The mathematical model will be used to simulate the mechanical and structural responses of the composite clay cap during the testing processes. Based upon engineering experience and technical references, a set of nominal soil parameters have been selected. Currently, detailed soil test data and cavity configuration data are not available to validate the mathematical model. Since the configuration of the cavities created in the testing process is irregular and unpredictable, two extreme configurations are considered in this mathematical model, viz., the circular cavity and the infinitely long trench in the sand underneath the cap. This approach will provide bounds for the testing results.

20963 (WSRC-TR–94-0410) **Cylinder supplied ammonia scrubber testing in IDMS.** Lambert, D.P. Westinghouse Hanford Co., Richland, WA (United States). 31 Aug 1994. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95010961. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes the results of the off-line testing the Integrated DWPF Melter System (IDMS) ammonia scrubbers using ammonia supplied from cylinders. Three additional tests with ammonia are planned to verify the data collected during off-line testing. Operation of the ammonia scrubber during IDMS SRAT and SME processing will be completed during the next IDMS run. The Sludge Receipt and Adjustment Tank (SRAT) and Slurry Mix Evaporator (SME) scrubbers were successful in removing ammonia from the vapor stream to achieve ammonia vapor concentrations far below the 10 ppM vapor exit design basis. In most of the tests, the ammonia concentration in the vapor exit was lower than the detection limit of the analyzers so results are generally reported as <0.05 parts per million (ppM). During SRAT scrubber testing, the ammonia concentration was no higher than 2 ppM and during SME testing the ammonia concentration was no higher than 0.05 m.

20964 (WSRC-TR–94-0478) **Test Plan for Methanotrophic Bioreactor at Savannah River Site-TNX.** Berry, C.J. Westinghouse Savannah River Co., Aiken, SC (United States). 4 Oct 1994. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060143. Source: OSTI; NTIS; INIS; GPO Dep.

The primary purpose of this project is to demonstrate the feasibility and practicality of operating a methanotrophic mobile trickle filter bioreactor (MMB) unit to effectively reduce or eliminate trichloroethylene (TCE) and associated hydrocarbons from contaminated groundwater. The two-column trickle filter system can process 1.67 gallons per minute (gpm) of contaminated groundwater. During this project, the pilot system will evaluate, optimize, and demonstrate methanotrophic treatment technology (MTT). The mobile system will receive a 1–4% methane to air mixture for stimulating the methanotrophic TCE degrading bacteria, thereby increasing the rates of degradation of these contaminants. This project will also evaluate the efficacy of different bacteria for degrading TCE for use in the system at the laboratory-scale sample groundwater monitoring wells at TNX and set up the system for continued operation. The trickle filter system may be used to inexpensively treat other small-scale organic waste streams at SRS after the initial start-up. The MTT was demonstrated as an effective and efficient method of degrading TCE in the laboratory and during a field-scale in situ demonstration for degrading TCE in a groundwater plume at SRS. The methanotrophic bacteria increase significantly in population numbers and in the production of methane monooxygenase (MMO), an extremely powerful oxidizer. MMO was demonstrated as effective in oxidizing TCE and other recalcitrant compounds in laboratory studies. In the presence of MMO, TCE is oxidized to TCE-epoxide, which breaks down spontaneously into simple, easily degraded, daughter compounds. The system will receive a 1–4% methane to air mixture, which will effectively grow and maintain the methanotrophic bacteria that will degrade TCE. This demonstration will have broad applications to bioremediating contaminated groundwater systems where in situ bioremediation is not practical.

20965 (WSRC-TR–94-0608-Ref.) **Proposed Site Treatment Plan (PSTP). STP reference document.** Westinghouse Savannah River Co., Aiken, SC (United States). 22 Feb 1995. 762p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95013475. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy (DOE) is required by Section 3021(b) of the Resource Conservation and Recovery Act (RCRA), as amended by the Federal Facility Compliance Act (FFCAct), to prepare a plan describing the development of treatment capacities and technologies for treating mixed waste (hazardous/radioactive waste). DOE decided to prepare its site treatment plan in a three phased approach. The first phase, called the Conceptual Site Treatment Plan (CSTP), was issued in October 1993. At the Savannah River Site (SRS) the CSTP described mixed waste streams generated at SRS and listed treatment scenarios for each waste stream utilizing an onsite, offsite DOE, and offsite or onsite commercial or vendor treatment option. The CSTP is followed by the Draft Site Treatment Plan (DSTP), due to be issued in August 1994. The DSTP, the current activity., will narrow the options discussed in the CSTP to a preferred treatment option, if possible, and will include waste streams proposed to be shipped to SRS from other DOE facilities as well as waste streams SRS may send offsite for treatment. The SRS DSTP process has been designed to address treatment options for each of the site's mixed waste streams. The SRS Proposed Site Treatment Plan (PSTP) is due to be issued in February 1995. The compliance order would be derived from the PSTP.

20966 (WSRC-TR–95-0025) **Survival of planted tupelo seedlings in F- and H-Area tree-kill zones.** Nelson, E.A.; Rogers, V.A. Westinghouse Savannah River Co., Aiken, SC (United States). Jan 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95010975. Source: OSTI; NTIS; INIS; GPO Dep.

Swamp tupelo seedlings were planted in four areas which experienced previous tree mortality at the seeplines of the F- and H-Area Seepage Basins. The sites represented a range in severity of impact and stage of recovery. Seedlings were planted in February of 1994 and followed through the first growing season in the field. Survival on all sites through the first growing season was excellent, with greater than 92% of the seedlings still alive. Most seedlings appeared healthy with few external signs of stress. The performance of the seedlings will be followed in subsequent years to determine the physical state of the soil environment on seedling growth. Hopefully, the results will indicate that artificial reforestation can begin on similarly impacted sites prior to the beginning of natural revegetation of the site.

20967 (WSRC-TR–95-0029) **Magnetic Survey of K-Area Bingham Pump Outage Pit.** Cumbest, R.J. Westinghouse Savannah River Co., Aiken, SC (United States). 19 Jan 1995. 94p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060135. Source: OSTI; NTIS; INIS; GPO Dep.

A magnetic survey was conducted at the K-Area Bingham Pump Outage Pit to locate buried metallic construction material placed in the pit. The survey was defined by survey lines spaced 10 feet apart and oriented subperpendicular to the pit elongation direction with survey stations spaced at 5-foot intervals along each line. This arrangement resulted in a 10-foot by 5-foot rectangular grid node pattern. The magnetic survey resolved a linear array of magnetic field and gradient anomalies that result from ferric material buried in the pit. The magnetic survey also resolved other isolated anomalies from ferric sources such as signs and monuments located on the surface. Comparison of the magnetic survey data with

radar transects collected in a previous survey indicates that the magnetic anomalies, in most cases, correlate well with diffractions in the radar data. At locations where the anomalies and diffractions do not correlate well, it appears that the radar transect did not pass directly over the anomaly source, resulting in off-line, three-dimensional (3-D) effects in the radar data. Based on the comparison of the two methods, the magnetic data resolves the part of the trench containing the ferrous material; however, the radar data are sensitive to disturbed soil and can resolve the trench boundaries in the absence of buried metallic material.

20968 (WSRC-TR–95-0160) **Decontaminating and Melt Recycling Tritium Contaminated Stainless Steel.** Clark, E.A. Westinghouse Savannah River Co., Aiken, SC (United States). 3 Apr 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060140. Source: OSTI; NTIS; INIS; GPO Dep.

The Westinghouse Savannah River Company, Idaho National Engineering Laboratory, and several university and industrial partners are evaluating recycling radioactively contaminated stainless steel. The goal of this program is to recycle contaminated stainless steel scrap from US Department of Energy national defense facilities. There is a large quantity of stainless steel at the DOE Savannah River Site from retired heavy water moderated Nuclear material production reactors (for example heat exchangers and process water piping), that will be used in pilot studies of potential recycle processes. These parts are contaminated by fission products, activated species, and tritium generated by neutron irradiation of the primary reactor coolant, which is heavy (deuterated) water. This report reviews current understanding of tritium contamination of stainless steel and previous studies of decontaminating tritium exposed stainless steel. It also outlines stainless steel refining methods, and proposes recommendations based on this review.

20969 (WSRC-TR–95-0176) **Electronic Denitration Savannah River Site Radioactive Waste.** Hobbs, D.T. Westinghouse Savannah River Co., Aiken, SC (United States). 11 Apr 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060149. Source: OSTI; NTIS; INIS; GPO Dep.

Electrochemical destruction of nitrate in radioactive Savannah River Site Waste has been demonstrated in a bench-scale flow cell reactor. Greater than 99% of the nitrate can be destroyed in either an undivided or a divided cell reactor. The rate of destruction and the overall power consumption is dependent on the cell configuration and electrode materials. The fastest rate was observed using an undivided cell equipped with a nickel cathode and nickel anode. The use of platinized titanium anode increased the energy requirement and costs compared to a nickel anode in both the undivided and divided cell configurations.

20970 (WSRC-TR–95-0178) **Limits on Annulus Air Outages in Types 1, 2, and 3 Waste Tanks.** Wiersma, B.J.; Sindelar, R. L. Westinghouse Savannah River Co., Aiken, SC (United States). 12 Apr 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060142. Source: OSTI; NTIS; INIS; GPO Dep.

An evaluation was performed on the impact of abnormal air flow conditions on the structural integrity of Types 1, 2, and 3 waste tanks. Warm, dry air in the annular space is necessary to preclude low temperature embrittlement and corrosive conditions for the carbon steel materials. For Type 1 and 2 tanks the annulus air system should be repaired within a month to minimize the potential for low temperature embrittlement and corrosive conditions, for Tanks 29-34, which are Type 3 tanks, it is recommended that the system be repaired within two months to minimize the potential for low temperature embrittlement. For all other Type 3 tanks repair of the system within six months is adequate to minimize general corrosion.

0530 Environmental Aspects

20971 (DOE–95012345) **Environmental surveillance results for 1994 for the Hazelwood Interim Storage Site. FUSRAP technical memorandum Number 140-95-011.** Szojka, S. USDOE, Washington, DC (United States). 1 Jun 1995. 51p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012345. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents analytical results and an interpretation of the results for samples collected as part of the 1994 environmental surveillance program for the Hazelwood Interim Storage Site (HISS) for the interim storage of radiologically contaminated soils. The discussion provides a comparative analysis of local background conditions and applicable regulatory criteria to results reported for external gamma radiation and for samples from the media investigated (air, surface water, sediment, groundwater, and stormwater). Results from the 1994 environmental surveillance program at HISS indicate that Department of Energy (DOE) guidelines were not exceeded for the calculated airborne particulate dose or for the monitored constituents.

20972 (DOE/EA–0808) **Future management of hazardous wastes generated at Brookhaven National Laboratory, Upton, New York. Environmental assessment.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Sep 1994. 47p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012127. Source: OSTI; NTIS; INIS; GPO Dep.

This document assesses the potential environmental impacts of a variety of alternatives which could provide a Resource Conservation and Recovery Act (RCRA) permitted waste packaging and storage facility that would handle all hazardous, radioactive, and mixed wastes generated at Brookhaven National Laboratory (BNL) and would operate in full compliance with all federal, state, and local laws and regulations. Location of the existing Hazardous Waste Management Facility (HWMF) with respect to ground water and the site boundary, technical and capacity limitations, inadequate utilities, and required remediation of the area make the existing facility environmentally unacceptable for long term continued use. This Environmental Assessment (EA) describes the need for action by the Department of Energy (DOE). It evaluates the alternatives for fulfilling that need, including the alternative preferred by DOE, a no-action alternative, and other reasonable alternatives. The EA provides a general description of BNL and the existing environment at the current HWMF and alternative locations considered for a new Waste Management Facility (WMF). Finally, the EA describes the potential environmental impacts of the alternatives considered. The preferred alternative, also identified as Alternative D, would be to construct and operate a new WMF on land formerly occupied by barracks during Camp Upton operations, in an area north of Building 830 and the High Flux Beam Reactor/Alternating Gradient Synchrotron (AGS) recharge basins, east of North Railroad Street, and south of East Fifth Avenue. The purpose of this new facility would be to move all storage and transfer activities inside buildings and on paved and curbed areas, consolidate facilities to improve operations management, and provide improved protection of the environment.

20973 (DOE/EA–0937) **Environmental assessment for the construction and operation of waste storage facilities at the Paducah Gaseous Diffusion Plant, Paducah, Kentucky.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of NEPA Oversight. Jun 1994. 147p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012965. Source: OSTI; NTIS; INIS; GPO Dep.

DOE is proposing to construct and operate 3 waste storage facilities (one 42,000 ft^2 waste storage facility for RCRA waste, one 42,000 ft^2 waste storage facility for toxic waste (TSCA), and one 200,000 ft^2 mixed (hazardous/radioactive) waste storage facility) at Paducah. This environmental assessment compares impacts of this proposed action with those of continuing present practices aof of using alternative locations. It is found that the construction, operation, and ultimate closure of the proposed waste storage facilities would not significantly affect the quality of the human environment

within the meaning of NEPA; therefore an environmental impact statement is not required.

20974 (DOE/EA–1000) **Proposed low-level radioactive waste handling building at Fermi National Accelerator Laboratory, Batavia, Illinois.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). [1995]. 48p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012248. Source: OSTI; NTIS; GPO Dep.

The US Department of Energy (DOE) has prepared an Environmental Assessment (EA), evaluating the impacts associated with the proposed Low-Level Radioactive Waste Building at the Fermi National Accelerator Laboratory (Fermilab) in Batavia, Illinois. As a result of the high energy physics program at Fermilab, small quantities of low-level radioactive wastes are generated. These wastes are collected, sorted and packaged for shipment to an off-site disposal facility in Hanford, Washington. The proposed project includes the construction of a new building to house, all low-level radioactive waste handling operations. The building would provide workspace for five full-time workers. The proposed project would improve the efficiency and safety of the low-level radioactive waste handling at Fermilab by upgrading equipment and consolidating operations into one facility.

20975 (DOE/EA–1005-Vol.1) **Disposition and transportation of surplus radioactive low specific activity nitric acid. Volume 1, Environmental Assessment.** USDOE Richland Operations Office, WA (United States). May 1995. 95p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012966. Source: OSTI; NTIS; INIS; GPO Dep.

DOE is deactivating the PUREX plant at Hanford; this will involve the disposition of about 692,000 liters (183,000 gallons) of surplus nitric acid contaminated with low levels of U and other radionuclides. The nitric acid, designated as low specific activity, is stored in 4 storage tanks at PUREX. Five principal alternatives were evaluated: transfer for reuse (sale to BNF plc), no action, continued storage in Hanford upgraded or new facility, consolidation of DOE surplus acid, and processing the LSA nitric acid as waste. The transfer to BNF plc is the preferred alternative. From the analysis, it is concluded that the proposed disposition and transportation of the acid does not constitute a major federal action significantly affecting the quality of the human environment within the meaning of NEPA; therefore an environmental impact statement is not required.

20976 (DOE/EA–1005-Vol.2) **Disposition and transportation of surplus radioactive low specific activity nitric acid. Volume 2, Environmental Assessment.** USDOE Richland Operations Office, WA (United States). May 1995. 235p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012967. Source: OSTI; NTIS; INIS; GPO Dep.

This volume consists of two appendices: public comments and DOE responses, and public comments not requiring responses.

20977 (DOE/EA–1063) **Disposition of highly enriched uranium obtained from the Republic of Kazakhstan. Environmental assessment.** USDOE Office of Fissile Materials Disposition, Washington, DC (United States). May 1995. 86p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95013323. Source: OSTI; NTIS; INIS; GPO Dep.

This EA assesses the potential environmental impacts associated with DOE's proposal to transport 600 kg of Kazakhstand-origin HEU from Y-12 to a blending site (B&W Lynchburg or NFS Erwin), transport low-enriched UF6 blending stock from a gaseous diffusion plant to GE Wilmington and U oxide blending stock to the blending site, blending the HEU and uranium oxide blending stock to produce LEU in the form of uranyl nitrate, and transport the uranyl nitrate from the blending site to USEC Portsmouth.

20978 (DOE/EA–1065) **Environmental assessment for the proposed construction and operation of a Genome Sequencing Facility in Building 64 at Lawrence Berkeley Laboratory, Berkeley, California.** USDOE, Washington, DC (United States). Apr 1995. 34p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012234. Source: OSTI; NTIS; INIS; GPO Dep.

This document is an Environmental Assessment (EA) for a proposed project to modify 14,900 square feet of an existing building (Building 64) at Lawrence Berkeley Laboratory (LBL) to operate as a Genome Sequencing Facility. This EA addresses the potential environmental impacts from the proposed modifications to Building 64 and operation of the Genome Sequencing Facility. The proposed action is to modify Building 64 to provide space and equipment allowing LBL to demonstrate that the Directed DNA Sequencing Strategy can be scaled up from the current level of 750,000 base pairs per year to a facility that produces over 6,000,000 base pairs per year, while still retaining its efficiency.

20979 (ES/ESH–48) **Environmental monitoring and surveillance on the Oak Ridge Reservation: 1993 Data.** Koncinski, W.S. (ed.) (Oak Ridge National Lab., TN (United States)). Oak Ridge Y-12 Plant, TN (United States); Oak Ridge National Lab., TN (United States); Oak Ridge K-25 Site, TN (United States). Dec 1994. 492p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95013227. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental monitoring and surveillance are conducted on the Oak Ridge Reservation and its environs throughout the year. Environmental monitoring ensures that (1) the reservation is a safe place to work, (2) activities on the reservation do not adversely affect the neighboring communities, and (3) compliance is made with federal and state regulations. This document is a compilation of the monitoring and surveillance data for calendar year 1993. It is a tool for analysts in the fields of environmental monitoring and environmental restoration. The summary information found in the annual site environmental report was drawn from the contents of summary in this document.

20980 (K/GDP/SAR–65) **Application of the HGSYSTEM/UF_6 model to simulate atmospheric dispersion of UF_6 releases from uranium enrichment plants.** Goode, W.D. Jr.; Bloom, S.G.; Keith, K.D. Jr. Oak Ridge K-25 Site, TN (United States). [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (CONF-950927–1: International conference and workshop on modeling and mitigating the consequences of accidental releases of hazardous materials, New Orleans, LA (United States), 26-29 Sep 1995). Order Number DE95007708. Source: OSTI; NTIS; INIS; GPO Dep.

Uranium hexafluoride is a dense, reactive gas used in Gaseous Diffusion Plants (GDPs) to make uranium enriched in the ^{235}U isotope. Large quantities of UF_6 exist at the GDPs in the form of in-process gas and as a solid in storage cylinders; smaller amounts exist as hot liquid during transfer operations. If liquid UF_6 is released to the environment, it immediately flashes to a solid and a dense gas that reacts rapidly with water vapor in the air to form solid particles of uranyl fluoride and hydrogen fluoride gas. Preliminary analyses were done on various accidental release scenarios to determine which scenarios must be considered in the safety analyses for the GDPS. These scenarios included gas releases due to failure of process equipment and liquid/gas releases resulting from a breach of transfer piping from a cylinder. A major goal of the calculations was to estimate the response time for mitigating actions in order to limit potential off-site consequences of these postulated releases. The HGSYSTEM/UF_6 code was used to assess the consequences of these release scenarios. Inputs were developed from release calculations which included two-phase, choked flow followed by expansion to atmospheric pressure. Adjustments were made to account for variable release rates and multiple release points. Superpositioning of outputs and adjustments for exposure time were required to evaluate consequences based on health effects due to exposures to uranium and HF at a specific location.

20981 (LA–12573-MS) **Distribution of potentially hazardous phases in the subsurface at Yucca Mountain, Nevada.** Guthrie, G.D. Jr.; Bish, D.L.; Chipera, S.J.; Raymond, R. Jr. Los Alamos National Lab., NM (United States). May 1995. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95011012. Source: OSTI; NTIS; INIS; GPO Dep.

Drilling, trenching, excavation of the Exploratory Studies Facility, and other surface and underground-distributing activities have the potential to release minerals into the environment from tuffs at

Yucca Mountain, Nevada. Some of these minerals may be potential respiratory health hazards. Therefore, an understanding of the distribution of the minerals that may potentially be liberated during site-characterization and operation of the potential repository is crucial to ensuring worker and public safety. Analysis of previously reported mineralogy of Yucca Mountain tuffs using data and criteria from the International Agency for Research on Cancer (IARC) suggests that the following minerals are of potential concern: quartz, cristobalite, tridymite, opal-CT, erionite, mordenite, and palygorskite. The authors have re-evaluated the three-dimensional mineral distribution at Yucca Mountain above the static water level both in bulk-rock samples and in fractures, using quantitative X-ray powder diffraction analysis. Erionite, mordenite, and palygorskite occur primarily in fractures; the crystalline-silica minerals, quartz, cristobalite, and tridymite are major bulk-rock phases. Erionite occurs in the altered zone just above the lower Topopah Spring Member vitrophyre, and an occurrence below the vitrophyre but above the Calico Hills has recently been identified. In this latter occurrence, erionite is present in the matrix at levels up to 35 wt%. Mordenite and palygorskite occur throughout the vadose zone nearly to the surface. Opal-CT is limited to zeolitic horizons.

20982 (UCRL-ID–119101) **A progress report for the large block test of the coupled thermal-mechanical-hydrological-chemical processes.** Lin, W. (and others); Wilder, D.G.; Blink, J. Lawrence Livermore National Lab., CA (United States). Oct 1994. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95011432. Source: OSTI; NTIS; INIS; GPO Dep.

This is a progress report on the Large Block Test (LBT) project. The purpose of the LBT is to study some of the coupled thermal-mechanical-hydrological-chemical (TMHC) processes in the near field of a nuclear waste repository under controlled boundary conditions. To do so, a large block of Topopah Spring tuff will be heated from within for about 4 to 6 months, then cooled down for about the same duration. Instruments to measure temperature, moisture content, stress, displacement, and chemical changes will be installed in three directions in the block. Meanwhile, laboratory tests will be conducted on small blocks to investigate individual thermal-mechanical, thermal-hydrological, and thermal-chemical processes. The fractures in the large block will be characterized from five exposed surfaces. The minerals on fracture surfaces will be studied before and after the test. The results from the LBT will be useful for testing and building confidence in models that will be used to predict TMHC processes in a repository. The boundary conditions to be controlled on the block include zero moisture flux and zero heat flux on the sides, constant temperature on the top, and constant stress on the outside surfaces of the block. To control these boundary conditions, a load-retaining frame is required. A 3 x 3 x 4.5 m block of Topopah Spring tuff has been isolated on the outcrop at Fran Ridge, Nevada Test Site. Pre-test model calculations indicate that a permeability of at least 10^{-15} m^2 is required so that a dryout zone can be created within a practical time frame when the block is heated from within. Neutron logging was conducted in some of the vertical holes to estimate the initial moisture content of the block. It was found that about 60 to 80% of the pore volume of the block is saturated with water. Cores from the vertical holes have been used to map the fractures and to determine the properties of the rock. A current schedule is included in the report.

20983 (UCRL-JC–119798) **Criteria for calculating the efficiency of deep-pleated HEPA filters with aluminum separators during and after design basis accidents.** Bergman, W. (Lawrence Livermore National Lab., CA (United States)); First, M.W.; Anderson, W.L.; Gilbert, H.; Jacox, J.W. Lawrence Livermore National Lab., CA (United States). Feb 1995. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-940738–12: 23. DOE/NRC nuclear air cleaning and treatment conference, Buffalo, NY (United States), 25-28 Jul 1994). Order Number DE95011438. Source: OSTI; NTIS; INIS; GPO Dep.

The authors have reviewed the literature on the performance of high efficiency particulate air (HEPA) filters under normal and abnormal conditions to establish criteria for calculating the efficiency of HEPA filters in a DOE nonreactor nuclear facility during and after a Design Basis Accident (DBA). This study is only applicable to the standard deep-pleated HEPA filter with aluminum separators as specified in ASME N509. The literature review included the performance of new filters and parameters that may cause deterioration in the filter performance such as filter age, radiation, corrosive chemicals, seismic and rough handling, high temperature, moisture, particle clogging, high air flow and pressure pulses. The deterioration of the filter efficiency depends on the exposure parameters; in severe exposure conditions the filter will be structurally damaged and have a residual efficiency of 0%. Despite the many studies on HEPA filter performance under adverse conditions, there are large gaps and limitations in the data that introduce significant error in the estimates of HEPA filter efficiencies under DBA conditions. Because of this limitation, conservative values of filter efficiency were chosen when there was insufficient data.

20984 (WHC-EP–0466-2) **Facility effluent monitoring plan for 242-A evaporator facility.** Crummel, G.M.; Gustavson, R.D. Westinghouse Hanford Co., Richland, WA (United States). Feb 1995. 204p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008793. Source: OSTI; NTIS; INIS; GPO Dep.

A facility effluent monitoring plan is required by the U.S. Department of Energy in DOE Order 5400.1 for any operations that involve hazardous materials and radioactive substances that could affect employee or public safety or the environment. A facility effluent monitoring plan determination was performed during Calendar Year 1991 and the evaluation showed the need for a facility effluent monitoring plan. This document is prepared using the specific guidelines identified in A Guide for Preparing Hanford Site Facility Effluent Monitoring Plans, WHC-EP-0438-1. This facility effluent monitoring plan assesses effluent monitoring systems and evaluates whether they are adequate to ensure the public health and safety as specified in applicable federal, state, and local requirements. This facility effluent monitoring plan shall ensure long-range integrity of the effluent monitoring systems by requiring an update whenever a new process or operation introduces new hazardous materials or significant radioactive materials. This document must be reviewed annually even if there are no operational changes, and it must be updated, as a minimum, every three years.

20985 (WHC-EP–0536-2) **Quality assurance program plan for radionuclide airborne emissions monitoring.** Boom, R.J. Westinghouse Hanford Co., Richland, WA (United States). Mar 1995. 205p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010579. Source: OSTI; NTIS; INIS; GPO Dep.

This Quality Assurance Program Plan identifies quality assurance program requirements and addresses the various Westinghouse Hanford Company organizations and their particular responsibilities in regards to sample and data handling of airborne emissions. The Hanford Site radioactive airborne emissions requirements are defined in National Emissions Standards for Hazardous Air Pollutants (NESHAP), Code of Federal Regulations, Title 40, Part 61, Subpart H (EPA 1991a). Reporting of the emissions to the US Department of Energy is performed in compliance with requirements of US Department of Energy, Richland Operations Office Order 5400.1, General Environmental Protection Program (DOE-RL 1988). This Quality Assurance Program Plan is prepared in accordance with and to the requirements of QAMS-004/80, Guidelines and Specifications for Preparing Quality Assurance Program Plans (EPA 1983). Title 40 CFR Part 61, Appendix B, Method 114, Quality Assurance Methods (EPA 1991b) specifies the quality assurance requirements and that a program plan should be prepared to meet the requirements of this regulation. This Quality Assurance Program Plan identifies NESHAP responsibilities and how the Westinghouse Hanford Company Environmental, Safety, Health, and Quality Assurance Division will verify that the methods are properly implemented.

20986 (WHC-SD-EN-CSUD–002) **ABCASH plotting program users guide.** Troyer, G.L. Westinghouse Hanford Co., Richland, WA (United States). 25 Apr 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011652. Source: OSTI; NTIS; INIS; GPO Dep.

The Automated Bar Coding of Air Samples at Hanford (ABCASH) system provides an integrated data collection, sample tracking, and data reporting system for radioactive particulate air filter samples. The ABCASH plotting program provides a graphical trend report for ABCASH of the performance of air sample results. This document provides an operational guide for using the program. Based on sample location identifier and date range, a trend chart of the available data is generated. The trend chart shows radiological activity versus time. General indications of directional trend of the concentrations in air over time may be discerned. Comparison limit set point values are also shown as derived from the ABCASH data base.

20987 (WHC-SD-GN-TI–20004) **A method for estimating ground areas contaminated by a postulated fire in a facility containing radioactive material.** Himes, D.A. Westinghouse Hanford Co., Richland, WA (United States). 31 Aug 1994. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010677. Source: OSTI; NTIS; INIS; GPO Dep.

A simple method has been developed for estimating the extent of radiological ground contamination associated with postulated fires in nuclear facilities to be used as input to the estimation of replacement and cleanup cost. The basic model assumes that the radioactive material is released in the form of particles in a wide range of sizes (0 to about 300 μm) and is carried aloft in the thermal plume from the fire. The particles are then assumed to be released where the thermal plume reaches equilibrium height, and to fall to the ground at a continuous range of speeds associated with the various particle sizes. The thermal output of the fire and resulting equilibrium plume height are determined using standard models. The downward movement and dispersion of the particles is modelled using a tilted Gaussian plume. This approach produces a realistic distribution of particulate material on the ground with the larger particles fatting close to the fire and smaller particles being carried further out and dispersed over a Larger area. The model includes simple methods to determine maximum allowable inventory or fire size so as not to exceed a limiting cleanup area (or cost), thus permitting direct calculation of the maximum sizes of inventory modules to be separated by fire barriers.

20988 (WHC-SP–0665-16) **Quarterly environmental radiological survey summary: First quarter 1995 100, 200, 300, and 600 Areas.** McKinney, S.M. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011571. Source: OSTI; NTIS; INIS; GPO Dep.

This report provides a summary of the radiological surveys performed in support of the operational environmental monitoring program at the Hanford Site. The surveys included in this program consist of inactive waste sites; outdoor radiological control areas; tank farm perimeters and associated diversion boxes, lift stations, and vent stations; perimeters of active or uncovered waste sites such as burial grounds, retention basins, ponds, process trenches, and ditches; and road and rail surfaces. This report provides a summary of the radiological surveys performed during the First Quarter of 1995. The status of corrective actions required from current and past reports are also discussed.

20989 (WSRC-TR–91-671-Rev.1) **An atmospheric tritium release database for model comparisons. Revision 1.** Murphy, C.E. Jr.; Wortham, G.R. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95010962. Source: OSTI; NTIS; INIS; GPO Dep.

A database of vegetation, soil, and air tritium concentrations at gridded coordinate locations following nine accidental atmospheric releases is described. While none of the releases caused a significant dose to the public, the data collected are valuable for comparison with the results of tritium transport models used for risk assessment. The largest, potential, individual off-site dose from any of the releases was calculated to be 1.6 mrem. The population dose from this same release was 46 person-rem which represents 0.04% of the natural background radiation dose to the population in the path of the release.

20990 (WSRC-TR–94-0492) **K-Area Acid/Caustic Basin groundwater monitoring report. Third quarter 1994.** Westinghouse Savannah River Co., Aiken, SC (United States). Dec 1994. 71p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95010976. Source: OSTI; NTIS; INIS; GPO Dep.

During third quarter 1994, samples from the KAC monitoring wells at the K-Area Acid/Caustic Basin were collected and analyzed for herbicides/pesticides, indicator parameters, metals, nitrate, radionuclide indicators, and other constituents. Monitoring results that exceeded the final Primary Drinking Water Standards (PDWS), other Savannah River Site (SRS) Flag 2 criteria, or the SRS turbidity standard are provided in this report. No constituents exceeded the final PDWS in the KAC wells. Aluminum and iron exceeded other SRS flagging criteria in one or more of the downgradient wells. Groundwater flow direction and rate in the water table beneath the K-Area Acid/Caustic Basin were similar to past quarters.

20991 (WSRC-TR–94-0545) **D&D Characterization of the 232-F Old Tritium Facility at the Savannah River Site.** Scallon, K.L.; England, J.L. Westinghouse Savannah River Co., Aiken, SC (United States). 17 Jan 1995. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950877–10: 3. American Society for Mechanical Engineers biannual mixed waste symposium, Baltimore, MD (United States), 7-11 Aug 1995). Order Number DE95060130. Source: OSTI; NTIS; INIS; GPO Dep.

The 232-F "Old Tritium Facility" operated in the 1950s as the first tritium production facility at the Savannah River Site (SRS). In 1957, the 232-F operation ceased with tritium production turned over to a larger, technologically improved facility at SRS. The 232-F Facility was abandoned in 1958 and the process areas have remained contaminated with radiological, hazardous and mixed constituents. Decontamination and decommissioning (D&D) of the 232-F Facility is scheduled to occur in the years 1995-1996. This paper presents the D&D characterization efforts for the 232-F Facility.

20992 (ANL/EAD/TM–42) **Derivation of guidelines for uranium residual radioactive material in soil at the former Baker Brothers, Inc., Site, Toledo, Ohio.** Nimmagadda, M.; Kamboj, S.; Yu, C. Argonne National Lab., IL (United States). Apr 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95012410. Source: OSTI; NTIS; INIS; GPO Dep.

Residual radioactive material guidelines for uranium in soil were derived for the former Baker Brothers, Inc., site in Toledo, Ohio. This site has been identified for remedial action under the U.S. Department of Energy's (DOE's) Formerly Utilized Sites Remedial Action Program (FUSRAP). Single-nuclide and total-uranium guidelines were derived on the basis of the requirement that following remedial action, the 50-year committed effective dose equivalent to a hypothetical individual living or working in the immediate vicinity of the site should not exceed a dose constraint of 30 mrem/yr for the current use and likely future use scenarios or a dose limit of 100 mrem/yr for less likely future use scenarios. The DOE residual radioactive material guideline computer code, RESRAD, was used in this evaluation; RESRAD implements the methodology described in the DOE manual for establishing residual radioactive material guidelines. Three scenarios were considered; each assumed that for a period of 1,000 years following remedial action, the site would be used without radiological restrictions. The three scenarios varied with regard to the type of site use, time spent at the site by the exposed individual, and sources of food and water consumed. The evaluation indicates that the dose constraint of 30 mrem/yr would not be exceeded for uranium (including uranium-234, uranium-235,

and uranium-238) within 1,000 years, provided that the soil concentration of total combined uranium (uranium-234, uranium-235, and uranium-238) at the former Baker Brothers site did not exceed 710 pCi/g for Scenario A (industrial worker, current use) or 210 pCi/g for Scenario B (resident - municipal water supply, a likely future use). The dose limit of 100 mrem/yr would not be exceeded at the site if the total uranium concentration of the soil did not exceed 500 pCi/g for Scenario C (subsistence farmer - on-site well water, a plausible but unlikely future use).

20993 (ANL/EAIS/PP–78512) **An object-oriented approach to site characterization decision support.** Johnson, R. Argonne National Lab., IL (United States). [1995]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95012210. Source: OSTI; NTIS; INIS; GPO Dep.

Effective decision support for site characterization is key to determining the nature and extent of contamination and the associated human and environmental risks. Site characterization data, however, present particular problems to technical analysts and decision-makers. Such data are four dimensional, incorporating temporal and spatial components. Their sheer volume can be daunting – sites with hundreds of monitoring wells and thousands of samples sent for laboratory analyses are not uncommon. Data are derived from a variety of sources including laboratory analyses, non-intrusive geophysical surveys, historical information, bore logs, in-field estimates of key physical parameters such as aquifer transmissivity, soil moisture content, depth-to-water table, etc. Ultimately, decisions have to be made based on data that are always incomplete, often confusing, inaccurate, or inappropriate, and occasionally wrong. In response to this challenge, two approaches to environmental decision support have arisen, Data Quality Objectives (DQOS) and the Observational Approach (OA). DQOs establish criteria for data collection by clearly defining the decisions that need to be made, the uncertainty that can be tolerated, and the type and amount of data that needs to be collected to satisfy the uncertainty requirements. In practice, DQOs are typically based on statistical measures. The OA accepts the fact that the process of characterizing and remediating contaminated sites is always uncertain. Decision-making with the OA is based on what is known about a site, with contingencies developed for potential future deviations from the original assumptions about contamination nature, extent, and risks posed.

20994 (ANL/EMO/CP–86349) **Action-oriented characterization at Argonne National Laboratory.** Moos, L.P.; Swale, R.E. Argonne National Lab., IL (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9505101–3: Conference on challenges and innovations in the management of hazardous waste, Washington, DC (United States), 10-12 May 1995). Order Number DE95013444. Source: OSTI; NTIS; INIS; GPO Dep.

Argonne National Laboratory-East and the US Department of Energy have initiated a voluntary corrective action strategy to characterize and clean up some of the on-site solid waste management units that are subject to the Resource Conservation and Recovery Act Corrective Action process. This strategy is designed for the current atmosphere of reduced funding levels and, increased demands for cleanup actions. A focused characterization program is used to identify and roughly delineate the areas of greatest risk, relying as much as possible on existing data about the site; then, removal or interim remedial actions are implemented, where appropriate. Two interim cleanup operations were completed in 1994. Two additional interim actions are planned for 1995. Future actions may include decontamination operations, soil remediation, and construction of containment barriers.

20995 (ANL/ES/PP–80277) **Development of an ultrasonic process for soil remediation.** Wu, J.M.; Huang, H.S.; Livengood, C.D. Argonne National Lab., IL (United States). [1995]. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95012208. Source: OSTI; NTIS; INIS; GPO Dep.

An ultrasonic process for the detoxification of carbon tetrachloride- (CCl_4^-) contaminated soil was investigated in the laboratory by using a batch irradiation reactor equipped with a 600-W ultrasonic power supply operated at a frequency of 20 kHz. Key parameters studied included soil characteristics, irradiation time, CCl_4 concentration, steady-state operating temperature, applied ultrasonic-wave energy, and the ratio of soil to water in the system. The results of the experiments showed that (1) residual CCl_4 concentrations could be decreased with longer irradiation periods and (2) detoxification efficiency was proportional to steady-state operating temperature and applied ultrasonic-wave energy. The characteristics of the contaminated soil were found to be an important factor in the design of an ultrasonic detoxification system. A soil-phase CCl_4 concentration below 1 ppm (initial concentration of 56 ppm) was achieved through this process, indicating that the application of ultrasonic irradiation is feasible and effective in the detoxification of soil contaminated by organic compounds. On the basis of the experimental results, a schematic of a full-scale ultrasonic soil-detoxification system was developed. Improvements to this novel process are discussed.

20996 (CONF-950216–139) **Trade-offs between worker risk and public risk during remediation at DOE sites.** Beam, B.N.; Morris, J.; Blaylock, B.; Travis, C. Oak Ridge National Lab., TN (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Waste management '95; Tucson, AZ (United States); 26 Feb - 2 mar 1995. Order Number DE95012881. Source: OSTI; NTIS; INIS; GPO Dep.

Within the next 30 years, the US Department of Energy (DOE) Environmental Restoration Program will be responsible for remediating thousands of waste sites across the DOE complex. A major concern during remediation will be the protection of thousands of workers engaged in the remediation. In addition to well know safety hazards associated with conventional construction operations, remedial workers at DOE will encounter radiation and chemical exposures from radioactive, hazardous, and mixed waste. Although historically represented as minimal due to a paucity of data related to worker exposures during remediation, potential worker health risk is an important factor that must be taken into account in the selection of remedial strategies, and the potential risk reduction offered by a remedial strategy must be weighed against the potential worker risk incurred during its implementation. Analysis has shown a trend that the worker risk incurred outweighs,the benefits of risk reduction to the public.

20997 (CONF-950570–23) **Radon concentration and working level in the Exploratory Studies Facility (ESF).** Stiver, J.H.; Tung, Chao-Hsiung. Science Applications International Corp., Las Vegas, NV (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC01-91RW00134. From International high-level radioactive waste management conference: progress toward understanding; Las Vegas, NV (United States); 1-5 May 1995. Order Number DE95012996. Source: OSTI; NTIS; INIS; GPO Dep.

Radon-222 (^{222}Rn) and ^{222}Rn progeny WL monitoring in the Exploratory Studies Facility (ESF) was initiated to support regulatory compliance. Measurements were taken over two periods, in Test Alcove No. 1 of the ESF, about 60 m from the tunnel entrance. For both periods, ^{222}Rn concentration was less than 10% of the Derived Air Concentration (DAC) set forth in DOE Order 5480.11. Thus, these assessments were sufficient to demonstrate regulatory compliance. Based on these findings, quarterly ^{222}Rn and ^{222}Rn progeny monitoring was initiated. Two systems each were employed for ^{222}Rn and ^{222}Rn progeny measurement. No significant differences were observed between the respective systems. An interesting finding was that at the time the measurements were taken, barometric pressure appeared to be the predominant factor controlling ^{222}Rn concentration in the ESF. This was true even during periods of ventilation shutdown.

20998 (DOE/AL/62350–177) **Ground water work breakdown structure dictionary.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Apr 1995. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95011234. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains the activities that are necessary to assess in ground water remediation as specified in the UMTRA Project.

These activities include the following: site characterization; remedial action compliance and design documentation; environment, health, and safety program; technology assessment; property access and acquisition activities; site remedial actions; long term surveillance and licensing; and technical and management support.

20999 (DOE/AL/62350–183) **Final audit report of remedial action construction at the UMTRA Project, Grand Junction, Colorado, processing site.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Feb 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95011231. Source: OSTI; NTIS; INIS; GPO Dep.

This final audit report (FAR) for remedial action at the Grand Junction, Colorado, Uranium Mill Tailings Remedial Action (UMTRA) Project processing site consists of a summary of the radiological surveillances/audits, the quality assurance (QA) in-process surveillances, and the QA final close-out inspection performed by the US Department of Energy (DOE) and Technical Assistance Contractor (TAC). The FAR also summarizes other surveillances performed by the US Nuclear Regulatory Commission (NRC). To summarize, a total of one finding and 127 observations were noted during DOE/TAC audit and surveillance activities. The NRC noted general site-related observations during the OSCRs. Follow-up to responses required from MK-Ferguson for the DOE/TAC finding and observations indicated that all issues related to the Grand Junction processing site were resolved and closed out to the DOE's satisfaction. The NRC OSCRs resulted in no issues related to the Grand Junction processing site requiring a response from MK-Ferguson.

21000 (DOE/AL/62350–190) **Private well/spring position paper, Rifle, Colorado, sites.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). May 1995. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95011233. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes the hydrogeochemical relationship between the New and Old Rifle processing sites and 15 domestic wells in their vicinity. The relationship of the domestic wells to the Old and New Rifle tailings sites requires clarification due to recent advances in understanding of Rifle site conceptual models. In order to form a bridge from the Rifle remedial action plan (RAP) and the recent baseline risk assessment to this position paper, several issues require discussion. First, through analysis of long-term ground water level data, the hydraulic gradient between the former tailings and private wells and springs was assessed. Second, in the Rifle RAP there was not a strong emphasis placed on describing regional influences on water quality in the vicinity of the processing sites. This document uses available information coupled with theory of regional ground water flow to describe regional flow systems north of Rifle. Third, the definition of background water quality from the RAP has been refined in several ways. Also, for the recent baseline risk assessment, all alluvial wells used to define background for the sites were located east of Old Rifle. In the RAP, alluvial background wells were also placed between the sites (downgradient of Old Rifle). Two additional wells were installed for the recent baseline risk assessment upgradient of Old Rifle which verified that several of the older wells (RFO-01-0597 and -0598) were in locations representative of background.

21001 (DOE/AL/62350–192) **Ground water elevation monitoring at the Uranium Mill Tailings Remedial Action Salt Lake City, Utah, Vitro processing site.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Apr 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95011232. Source: OSTI; NTIS; INIS; GPO Dep.

In February 1994, a ground water level monitoring program was begun at the Vitro processing site. The purpose of the program was to evaluate how irrigating the new golf driving range affected ground water elevations in the unconfined aquifer. The program also evaluated potential impacts of a 9-hole golf course planned as an expansion of the driving range. The planned golf course expansion would increase the area to be irrigated and, thus, the water that could infiltrate the processing site soil to recharge the unconfined aquifer. Increased water levels in the aquifer could alter the ground water flow regime; contaminants in ground water could migrate off the site or could discharge to bodies of surface water in the area. The potential effects of expanding the golf course have been evaluated, and a report is being prepared. Water level data obtained during this monitoring program indicate that minor seasonal mounding may be occurring in response to irrigation of the driving range. However, the effects of irrigation appear small in comparison to the effects of precipitation. There are no monitor wells in the area that irrigation would affect most; that data limitation makes interpretations of water levels and the possibility of ground water mounding uncertain. Limitations of available data are discussed in the conclusion.

21002 (DOE/AL/82993–10) **Phase II – Photovoltaics for Utility Scale Applications (PVUSA): Safety and health action plan.** Berg, K. Pacific Gas and Electric Co., San Ramon, CA (United States). Dept. of Research and Development. Sep 1994. 144p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC04-92AL82993. Order Number DE95013804. Source: OSTI; NTIS; GPO Dep.

To establish guidelines for the implementation and administration of an injury and illness prevention program for PVUSA and to assign specific responsibilities for the execution of the program. To provide a basic Safety and Health Action Plan (hereinafter referred to as Plan) that assists management, supervision, and project personnel in the recognition, evaluation, and control of hazardous activities and/or conditions within their respective areas of responsibility.

21003 (DOE/EA–0948) **Environmental assessment operation of the HB-Line facility and frame waste recovery process for production of Pu-238 oxide at the Savannah River Site.** USDOE Savannah River Operations Office, Aiken, SC (United States). Apr 1995. 60p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95013800. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy (DOE) has prepared an environmental assessment (EA), DOE/EA-0948, addressing future operations of the HB-Line facility and the Frame Waste Recovery process at the Savannah River Site (SRS), near Aiken, South Carolina. Based on the analyses in the EA, DOE has determined that the proposed action is not a major Federal action significantly affecting the quality of the human environment within the meaning of the National Environmental Policy Act (NEPA) of 1969. Therefore, DOE has concluded that, the preparation of an environmental impact statement is not required, and is issuing this Finding of No Significant Impact.

21004 (DOE/EA–1034) **Replacement of the Idaho National Engineering Laboratory Health Physics Instrumentation Laboratory.** USDOE Idaho Operations Office, Idaho Falls, ID (United States). May 1995. 39p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95013826. Source: OSTI; NTIS; INIS; GPO Dep.

The DOE-Idaho Operations Office (DOE-ID) has prepared an environmental assessment (EA) on the replacement of the Idaho National Engineering Laboratory Health Physics Instrumentation Laboratory at the Idaho National Engineering Laboratory (INEL). The purpose of this project is to replace the existing Health Physics Instrumentation Laboratory (HPIL) with a new facility to provide a safe environment for maintaining and calibrating radiation detection instruments used at the Idaho National Engineering Laboratory. The existing HPIL facility provides portable health physics monitoring instrumentation and direct reading dosimetry procurement, maintenance and calibration of radiation detection instruments, and research and development support-services to the INEL and others. However, the existing facility was not originally designed for laboratory activities and does not provide an adequate, safe environment for calibration activities. The EA examined the potential environmental impacts of the proposed action and evaluated reasonable alternatives, including the no action alternative in accordance with the Council on Environmental Quality (CEQ) Regulations (40 CFR Parts 1500-1508). Based on the environmental analysis in the attached EA, the proposed action will not have a significant effect on the human environment within the

meaning of the National Environmental Policy Act (NEPA) and 40 CFR Parts 1508.18 and 1508.27. The selected action (the proposed alternative) is composed of the following elements, each described or evaluated in the attached EA on the pages referenced. The proposed action is expected to begin in 1997 and will be completed within three years: design and construction of a new facility at the Central Facility Area of the INEL; operation of the facility, including instrument receipt, inspections and repairs, precision testing and calibration, and storage and issuance. The selected action will result in no significant environmental impacts.

21005 (DOE/EH–0488) **OSHWPP model programs guide.** USDOE Energy Information Administration, Washington, DC (United States). Office of Safety and Quality Assurance. Jun 1995. 87p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95013851. Source: OSTI; NTIS; GPO Dep.

Descriptions of model occupational health and safety programs implemented at DOE facilities are presented.

21006 (DOE/EIS–0198) **Draft programmatic environmental impact statement for the Uranium Mill Tailings Remedial Action Ground Water Project.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Apr 1995. 251p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95011264. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) is responsible for performing remedial action to bring surface and ground water contaminant levels at 24 inactive uranium processing sites into compliance with the US Environmental Protection Agency (EPA) standards. DOE is accomplishing this through the Uranium Mill Tailings Remedial Action (UMTRA) Surface and Ground Water Projects. Remedial action will be conducted with the concurrence of the US Nuclear Regulatory Commission (NRC) and the full participation of affected states and Indian tribes. Uranium processing activities at most of 24 the inactive mill sites resulted in the contamination of ground water beneath and, in some cases, downgradient of the sites. This contaminated ground water often has elevated levels of constituents such as uranium and nitrate. The purpose of the UMTRA Ground Water Project is to eliminate, or reduce to acceptable levels, the potential health and the environmental consequences of milling activities by meeting the EPA standards in areas where ground water has been contaminated. The first step in the UMTRA Ground Water Project is the preparation of this programmatic environmental impact statement (PEIS). This document analyzes potential impacts of four programmatic alternatives, including the proposed action. The alternatives do not address site-specific ground water compliance strategies. Rather, the PEIS is a planning document that provides a framework for conducting the Ground Water Project; assesses the potential programmatic impacts of conducting the Ground Water Project; provides a method for determining the site-specific ground water compliance strategies; and provides data and information that can be used to prepare site-specific environmental impacts analyses more efficiently.

21007 (DOE/EM–0232-Vol.2) **Estimating the cold war mortgage: The 1995 baseline environmental management report. Volume II: Site summaries.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). Mar 1995. 740p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012533. Source: OSTI; NTIS; INIS; GPO Dep.

This volume, Volume II presents the site data that was used to generate the Department of Energy's (DOE) initial Baseline Environmental Management Report (BEMR). The raw data was obtained by DOE field personnel from existing information sources and anticipated environmental management strategies for their sites and was tempered by general assumptions and guidance developed by DOE Headquarters personnel. This data was then integrated by DOE Headquarters personnel and modified to ensure that overall constraints such as funding and waste management capacity were addressed. The site summaries are presented by State and broken out by discrete activities and projects. The Volume I Glossary has been repeated to facilitate the reader's review of Volume II. The information presented in the site summaries represents the best data and assumptions available as of February 1, 1995. Assumptions that have not been mandated by formal agreement with appropriate regulators and other stakeholders do not constitute decisions by the Department nor do they supersede existing agreements. In addition, actions requiring decisions from external sources regarding unknowns such as future land use and funding/scheduling alternatives, as well as internal actions such as the Department's Strategic Realignment initiative, will alter the basis and general assumptions used to generate the results for this report. Consequently, the numbers presented in the site summaries do not represent outyear budget requests by the field installations.

21008 (DOE/EM–0234) **Cost quality management assessment report for the Kansas City Plant. Final report.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Office of Engineering and Cost Management. Apr 1995. 104p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95011865. Source: OSTI; NTIS; GPO Dep.

The Office of Engineering and Cost Evaluation (EM-24) conducted a Cost Quality Management Assessment (CQMA) at the Kansas City Plant (KCP) on March 16-27, 1992. The Round II CQMA at the KCP, conducted August 22-31, 1994, reviewed KCP's cost and cost-related management practices against POCs contained in the CQMA Site Handbook. Interviews of Department of Energy Kansas City Area Office (DOE-KCAO) and AlliedSignal personnel and a review of documents show that KCP has made measurable progress since the last CQMA. Of the 48 POCs, KCP meets 31 and partially meets 17. Among the key observations are the following: The DOE-KCAO and AlliedSignal are effectively managing the Environmental Restoration (ER) baseline, validated in FY 1992, through Baseline Change Control Procedures. KCP ER baseline performance is on schedule and under budget. Remedial Action at the KCP is expected to be completed by FY 2000. After FY 2000, only Waste Management (WM) operations in support of Defense Programs will be required. KCP has initiated a Baseline Change Proposal to combine five planned Corrective Measures Studies into one; the expected cost avoidance is $1M. AlliedSignal used the CQMA Handbook (Rev. 0) and the Action Plan developed in response to the Round I CQMA as a basis for improving cost-management systems, processes, and procedures. AlliedSignal is standardizing on Project 2/Series X software for baseline scheduling and cost and schedule performance reporting. For estimating environmental restoration and construction projects, AlliedSignal is converting to Composer Gold software, the commercial version Of MCACES Software developed by the U.S. Army Corps of Engineers. AlliedSignal is beginning to generate a site-specific database in Composer Gold for more accurately estimating constriction and remediation projects. The roles and responsibilities of DOE-KCAO and AlliedSignal managers and staff need to be clarified given the recent reorganization of AlliedSignal.

21009 (DOE/OR–01-1326-D1/V1) **Remedial investigation report on Waste Area Group 5 at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Volume 1: Technical summary.** Oak Ridge National Lab., TN (United States); Bechtel National, Inc., Oak Ridge, TN (United States); CH2M Hill Southeast, Inc., Oak Ridge, TN (United States); Ogden Environmental and Energy Services Co., Oak Ridge, TN (United States); Peer Consultants, Inc., Oak Ridge, TN (United States). Mar 1995. 119p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/ER–284-D1/V1; ORNL/ER/Sub–87-99053/76/V1). Order Number DE95012491. Source: OSTI; NTIS; INIS; GPO Dep.

A remedial investigation (RI) was performed to support environmental restoration activities for Waste Area Grouping (WAG) 5 at the Oak Ridge National Laboratory (ORNL) in Oak Ridge, Tennessee. The WAG 5 RI made use of the observational approach, which concentrates on collecting only information needed to assess site risks and support future cleanup work. This information was interpreted and is presented using the framework of the site conceptual model, which relates contaminant sources and release mechanisms to migration pathways and exposure points that are keyed to current and future environmental risks for both human and ecological receptors. The site conceptual model forms the basis of the WAG 5 remedial action strategy and remedial action objectives.

The RI provided the data necessary to verify this model and allows recommendations to be made to accomplish those objectives.

21010 (DOE/OR–01-1326-D1/V2) **Remedial investigation report on Waste Area Grouping 5 at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Volume 2, Appendix A: Characterization methods and data summary.** Oak Ridge National Lab., TN (United States); Bechtel National, Inc., Oak Ridge, TN (United States); CH2M Hill Southeast, Inc., Oak Ridge, TN (United States); Ogden Environmental and Energy Services Co., Oak Ridge, TN (United States); Peer Consultants, Inc., Oak Ridge, TN (United States). Mar 1995. 335p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/ER–284-D1/V2; ORNL/ER/Sub–87-99053/76/V2). Order Number DE95012490. Source: OSTI; NTIS; INIS; GPO Dep.

This appendix presents background regulatory and technical information regarding the solid waste management units (SWMUs) at Waste Area Grouping (WAG) 5 to address requirements established by the Federal Facility Agreement (FFA) for the Oak Ridge Reservation (ORR). The Department of energy (DOE) agreed to conduct remedial investigations (RIs) under the FFA at various sites at Oak Ridge National Laboratory (ORNL), including SWMUs and other areas of concern on WAG 5. The appendix gives an overview of the regulatory background to provide the context in which the WAG 5 RI was planned and implemented and documents how historical sources of data, many of which are SWMU-specific, were evaluated and used.

21011 (DOE/OR–01-1326-D1/V3) **Remedial investigation report on Waste Area Grouping 5 at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Volume 3, Appendix B, Technical findings and conclusions.** Oak Ridge National Lab., TN (United States); Bechtel National, Inc., Oak Ridge, TN (United States); CH2M Hill Southeast, Inc., Oak Ridge, TN (United States); Ogden Environmental and Energy Services Co., Oak Ridge, TN (United States); Peer Consultants, Inc., Oak Ridge, TN (United States). Mar 1995. 433p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/ER–284-D1/V3; ORNL/ER/Sub–87-99053/76/V3). Order Number DE95012492. Source: OSTI; NTIS; INIS; GPO Dep.

This Remedial Investigation Report on Waste Area Grouping, (NVAG) 5 at Oak Ridge National Laboratory was prepared in accordance with requirements under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) for reporting, the results of a site chacterization for public review. This work was performed under Work Breakdown Structure 1.4.12.6.1.05.40.02 (Activity Data Sheet 3305, "WAG 5"). Publication of this document meets a Federal Facility Agreement milestone of March 31, 1995. This document provides the Environmental Restoration Program with information about the results of investigations performed at WAG 5. It includes information on risk assessments that have evaluated long-term impacts to human health and the environment. Information provided in this document forms the basis for decisions regarding, the need for subsequent remediation work at WAG 5.

21012 (DOE/OR–01-1326-D1/V4) **Remedial investigation report on Waste Area Grouping 5 at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Volume 4: Appendix C, Risk assessment.** Oak Ridge National Lab., TN (United States); Bechtel National, Inc., Oak Ridge, TN (United States); CH2M Hill Southeast, Inc., Oak Ridge, TN (United States); Ogden Environmental and Energy Services Co., Oak Ridge, TN (United States); Peer Consultants, Inc., Oak Ridge, TN (United States). Mar 1995. 959p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Subcontract 95B-99053C. (ORNL/ER–284-D1/V4; ORNL/ER/Sub–87-99053/76/V4). Order Number DE95012540. Source: OSTI; NTIS; INIS; GPO Dep.

Waste Area Grouping (WAG) 5 is part of Oak Ridge National Laboratory (ORNL) and is located on the United States Department of Energy's Oak Ridge Reservation (DOE-ORR). The site lies southeast of Haw Ridge in Melton Valley and comprises approximately 32 ha (80 ac) [12 ha (30 ac) of forested area and the balance in grassed fields]. The western and southern boundaries of WAG are contiguous with the WAG 2 area which includes White Oak Creek and Melton Branch and associated floodplains. Waste Area Grouping 5 consists of several contaminant source areas for the disposal of low-level radioactive, transuranic (TRU), and fissile wastes (1959 to 1973) as well as inorganic and organic chemical wastes. Wastes were buried in trenches and auger holes. Radionuclides from buried wastes are being transported by shallow groundwater to Melton Branch and White Oak Creek. Different chemicals of potential concern (COPCS) were identified (e.g., cesium-137, strontium-90, radium-226, thorium-228, etc.); other constituents and chemicals, such as vinyl chloride, bis(2-ethylhexyl)phthalate, trichloroethene, were also identified as COPCS. Based on the results of this assessment contaminants of concern (COCS) were subsequently identified. The human health risk assessment methodology used in this risk assessment is based on Risk Assessment Guidance for Superfund (RAGS) (EPA 1989). First, the data for the different media are evaluated to determine.usability for risk assessment. Second, through the process of selecting COPCS, contaminants to be considered in the BHHRA are identified for each media, and the representative concentrations for these contaminants are determined. Third, an assessment of exposure potential is performed, and exposure pathways are identified. Subsequently, exposure is estimated quantitatively, and the toxicity of each of the COPCs is determined. The results of the exposure and toxicity assessments are combined and summarized in the risk characterization section.

21013 (DOE/OR/22160–T17) **Demonstration testing and evaluation of in situ soil heating. Management Plan, Revision 2.** Dev, H. IIT Research Inst., Chicago, IL (United States). 6 Mar 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-93OR22160. Order Number DE95007851. Source: OSTI; NTIS; INIS; GPO Dep.

This is the second revision to the Management Plan for US DOE contract entitled, "Demonstration Testing and Evaluation of In Situ Soil Heating," Contract Number DE-AC05-93OR22160, IITRI Project Number C06787. The cost plan and schedule have been revised herein. The Management Plan was revised once before, in March 1994. In this project IITRI will demonstrate its in situ soil heating and decontamination technology which uses 60 Hz AC power to heat soil to a temperature of about 900C. This technology is aimed at the decontamination of soil by the removal of organic hazardous constituents by the action of heat and a vacuum gas collection system.

21014 (DOE/RL–94-107-Rev.1) **Radioactive air emissions program notice of construction for the decommissioning of the 233-S Plutonium Concentration Facility Complex. Revision 1.** USDOE Richland Operations Office, WA (United States); Bechtel Hanford, Inc., Richland, WA (United States). Oct 1994. 75p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95007975. Source: OSTI; NTIS; INIS; GPO Dep.

This Notice of Construction (NOC) presents the required information regarding Phase 1 and 2 of the decommissioning of the 233-S Plutonium Concentration Facility Complex (233-S Complex). Phase 1 includes preparing the site, setting up temporary containments where required, removing inventory and equipment, and final decontamination of the structure. Phase 2 includes dismantling and removing the structure and final site stabilization. The project will include techniques that minimize the volume of the waste. Radioisotopes found include neptunium 237, plutonium 237, 238, 239, 240, 241, and 242, and americium 241. The 233-S building was designed and operated to concentrate the plutonium solutions generated by the REDOX Plant using an ion-exchange process. The process was expanded in 1962 to include neptunium received from the REDOX Plant.

21015 (DUN–2903-RD) **Draft of Mission No. 8 Nuclear Safety Program.** Douglas United Nuclear, Inc., Richland, WA (United States). 28 Jul 1967. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95012654. Source: OSTI; NTIS; GPO Dep.

The Nuclear Safety Program at the Richland facilities consists of seven, concurrent subprograms. Which are: Fuel Temperature Transients Under Accident Conditions; Chemical and Metallurgical Reactions and Fission Product Release from Overheated Fuel; Control of Fission Gases; Meteorological Studies; Ground Fixation of Radioactive Material in Liquid Wastes; Particle Formation and

Release from Overheated Nuclear Material; and Seismic Studies. The Scope and Objective and Incentives of the overall program are discussed and details provided on each of the seven subprograms.

21016 (NUREG–1496-Vol.1) **Generic environmental impact statement in support of rulemaking on radiological criteria for decommissioning of NRC-licensed nuclear facilities. Main report; Draft report for comment: Volume 1.** Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications. Aug 1994. 165p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

The action being considered in this draft Generic Environmental Impact Statement (GEIS) is an amendment to the Nuclear Regulatory Commission's (NRC) regulations in 10 CFR Part 20 to include radiological criteria for decommissioning of lands and structures at nuclear facilities. Under the National Environmental Policy Act (NEPA), all Federal agencies must consider the effect of their actions on the environment. To fulfill NRC's responsibilities under NEPA, the Commission is preparing this GEIS which analyzes alternative courses of action and the costs and impacts associated with those alternatives. In preparing the GEIS, the following approach was taken: (1) a listing was developed of regulatory alternatives for establishing radiological criteria for decommissioning; (2) for each alternative, a detailed analysis and comparison of incremental impacts, both radiological and nonradiological, to workers, members of the public, and the environment, and costs, were performed; and (3) based on the analysis of impacts and costs, preliminary recommendations were provided. Contained in the GEIS are recommendations related to the definition of decommissioning, the scope of rulemaking, the radiological criteria, restrictions on use, citizen participation, use of the GEIS in site-specific cases, and minimization of contamination.

21017 (NUREG–1496-Vol.2) **Generic environmental impact statement in support of rulemaking on radiological criteria for decommissioning of NRC-licensed nuclear facilities. Appendices; Draft report for comment – Volume 2.** Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications. Aug 1994. 574p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

The action being considered in this draft Generic Environmental Impact Statement (GEIS) is an amendment to the Nuclear Regulatory Commission's (NRC) regulations in 10 CFR Part 20 to include radiological criteria for decommissioning of lands and structures at nuclear facilities. Under the National Environmental Policy Act (NEPA), all Federal agencies must consider the effect of their actions on the environment. To fulfill NRC's responsibilities under NEPA, the Commission is preparing this GEIS which analyzes alternative courses of action and the costs and impacts associated with those alternatives. In preparing the GEIS, the following approach was taken: (1) a listing was developed of regulatory alternatives for establishing radiological criteria for decommissioning; (2) for each alternative, a detailed analysis and comparison of incremental impacts, both radiological and nonradiological, to workers, members of the public, and the environment, and costs, were performed; and (3) based on the analysis of impacts and costs, preliminary recommendations were provided. Contained in the GEIS are recommendations related to the definition of decommissioning, the scope of rulemaking, the radiological criteria, restrictions on use, citizen participation, use of the GEIS in site-specific cases, and minimization of contamination.

21018 (NUREG–1500) **Working draft regulatory guide on release criteria for decommissioning: NRC staff's draft for comment.** Daily, M.C.; Huffert, A.; Cardile, F.; Malaro, J.C. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications. Aug 1994. 166p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

The Nuclear Regulatory Commission's (NRC) regulations in 10 CFR 20 are being amended to include radiological criteria for decommissioning of lands and structures at nuclear facilities. 10 CFR Part 20, Subpart E establishes criteria for the remediation of contaminated sites or facilities that will allow their release for future use with or without restrictions. The criteria include a Total Effective Dose Equivalent (TEDE) limit of 15 mrem/year (0.15 mSv/y) that should not be exceeded by an average individual among those who could potentially receive the greatest exposure from any residual activity within a facility or on a site. The criteria also require a licensee to reduce any residual radioactivity to as-low-as-reasonably-achievable (ALARA) levels. This staff draft guide describes acceptable procedures for determining the predicted dose level (PDL) from any residual radioactivity at the site. It describes the basic features of the calculational models and the associated default assumptions and parameter values the NRC staff would find acceptable in calculating PDLs. Appendices A, B, and C provide numerical values that can be used to estimate the dose from residual radioactivity remaining at a site. Since 10 CFR Part 20, Subpart E introduces several new concepts, definitions and discussions are included in a regulatory position concepts section of the guide to assist licensees in understanding some of the philosophy underlying the rule.

21019 (ORNL/ER/Sub–87-99053/75) **Site characterization report for the Old Hydrofracture Facility at Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Oak Ridge National Lab., TN (United States); Bechtel National, Inc., Oak Ridge, TN (United States). Jan 1995. 219p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95013228. Source: OSTI; NTIS; INIS; GPO Dep.

Several Old Hydrofracture Facility (OHF) structures (i.e., Building 7852, the bulk storage bins, the pump house, water tank T-5, and pump P-3) are surplus facilities at Oak Ridge National Laboratory (ORNL) slated for decontamination and decommissioning (D and D). OHF was constructed in 1963 to allow experimentation and operations with an integrated solids storage, handling, mixing, and grout injection facility. It was shut down in 1980 and transferred to ORNL's Surveillance and Maintenance Program. The hydrofracture process was a unique disposal method that involved injecting waste materials mixed with grout and additives under pumping pressures of 2,000 psi or greater into a deep, low-permeability shale formation. The injected slurry spread along fractures and bedding planes for hundreds of feet from the injection points, forming thin grout sheets (often less than 1/8 in. thick). The grout ostensibly immobilized and solidified the liquid wastes. Site characterization activities were conducted in the winter and spring of 1994 to collect information necessary to plan the D and D of OHF structures. This site characterization report documents the results of the investigation of OHF D and D structures, presenting data from the field investigation and laboratory analyses in the form of a site description, as-built drawings, summary tables of radiological and chemical contaminant concentrations, and a waste volume estimate. 25 refs., 54 figs., 17 tabs.

21020 (ORNL/TM–12985) **Cost results from the 1994 Fernald characterization field demonstration for uranium-contaminated soils.** Douthat, D.M.; Stewart, R.N.; Armstrong, A.Q. Oak Ridge National Lab., TN (United States). Apr 1995. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95012541. Source: OSTI; NTIS; INIS; GPO Dep.

One of the principal objectives of the US Department of Energy (DOE) Office of Technology Development is to develop an optimum integrated system of technologies for removing uranium substances from soil. This system of technologies, through demonstration, must be proven in terms of cost reduction, waste minimization, risk reduction, and user applicability. To evaluate the effectiveness of these technologies, a field demonstration was conducted at the Fernald site in the summer of 1994. Fernald was selected as the host site for the demonstration based on environmental problems stemming from past production of uranium metal for defense-related applications. The following six alternative technologies were developed and/or demonstrated by the principal investigators in the Characterization Task Group at the field demonstration: (1) beta scintillation detector by Pacific Northwest Laboratory (PNL), (2) in situ gamma detector by PNL, (3) mobile laser ablation-inductively coupled plasma/atomic emission spectrometry (LA-ICP/AES) laboratory by Ames Laboratory, (4) long-range alpha detector (LRAD)

by Los Alamos National Laboratory (LANL), (5) passive radon monitoring by ORNL, and (6) electret ion chamber by ORNL.

21021 (PNL–10397) **Concentrations of radionuclides in terrestrial vegetation on the Hanford site of potential interest to Native Americans.** Poston, T.M. Pacific Northwest Lab., Richland, WA (United States). Mar 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95010422. Source: OSTI; NTIS; INIS; GPO Dep.

Concentrations of ^{90}Sr and ^{137}Cs in Carey's balsamroot (Balsamorhiza careyana) and Gray's desert parsley (Lomatium grayi) were similar to concentrations observed in other plants collected on the Hanford Site and from offsite locations surrounding the Site as part of annual Hanford Site surveillance. Observed concentrations may be attributed to historic fallout more than to Hanford Site emissions, although the observation that 200 Area plants had slightly higher concentrations of ^{137}Cs than 100 Area plants is consistent with other monitoring data of radioactivity in soil and vegetation collected onsite. The present concentrations of ^{90}Sr and ^{137}Cs in balsamroot and parsley fluctuate around background levels with some of the higher observed concentrations of ^{90}Sr found on the Fitzner/Eberhardt Arid Lands Ecology (ALE) Reserve. Analytical results and summary statistics by species and location are presented in the appendixes.

21022 (PNL–10524) **Arid sites stakeholder participation in evaluating innovative technologies: VOC-Arid Site Integrated Demonstration.** Peterson, T.S. (and others); McCabe, G.H.; Brockbank, B.R. Pacific Northwest Lab., Richland, WA (United States). May 1995. 192p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95012395. Source: OSTI; NTIS; GPO Dep.

Developing and deploying innovative environmental cleanup technologies is an important goal for the U.S. Department of Energy (DOE), which faces challenging remediation problems at contaminated sites throughout the United States. Achieving meaningful, constructive stakeholder involvement in cleanup programs, with the aim of ultimate acceptance of remediation decisions, is critical to meeting those challenges. DOE's Office of Technology Development sponsors research and demonstration of new technologies, including, in the past, the Volatile Organic Compounds Arid Site Integrated Demonstration (VOC-Arid ID), hosted at the Hanford Site in Washington State. The purpose of the VOC-Arid ID has been to develop and demonstrate new technologies for remediating carbon tetrachloride and other VOC contamination in soils and ground water. In October 1994 the VOC-Arid ID became a part of the Contaminant Plume Containment and Remediation Focus Area (Plume Focus Area). The VOC Arid ID's purpose of involving stakeholders in evaluating innovative technologies will now be carried on in the Plume Focus Area in cooperation with Site Technology Coordination Groups and Site Specific Advisory Boards. DOE's goal is to demonstrate promising technologies once and deploy those that are successful across the DOE complex. Achieving that goal requires that the technologies be acceptable to the groups and individuals with a stake in DOE facility cleanup. Such stakeholders include groups and individuals with an interest in cleanup, including regulatory agencies, Native American tribes, environmental and civic interest groups, public officials, environmental technology users, and private citizens. This report documents the results of the stakeholder involvement program, which is an integral part of the VOC-Arid ID.

21023 (PNL-SA–25501) **Radiation screening of excavated waste at Hanford's 118-B-1 burial site.** Stromswold, D.C. (Pacific Northwest Lab., Richland, WA (United States)); Alvarez, J.L.; Davis, A.I.; Duce, S.W.; Frain, J.; Ludowise, J.D. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950495–1: 7. national technology information exchange workshop, Cincinnati, OH (United States), 18-20 Apr 1995). Order Number DE95010724. Source: OSTI; NTIS; INIS; GPO Dep.

Radiation measurements on items excavated from a radioactive-waste burial ground were part of a field test of excavation, radiation screening, and waste sorting techniques being evaluated for the cleanup of Hanford burial sites. The radiation measurements investigated techniques for classifying bulk waste for placement into an environmental restoration disposal facility. Hand-held gamma-ray survey instruments measured exposure rates (mR/h) from contaminated dirt and radioactive objects as they were removed by heavy excavation equipment. Gamma-ray detectors mounted on the excavation equipment provided additional data that were transmitted by radio telemetry. Exposure rates from identifiable objects (e.g., specific reactor components) were compared with expected exposure rates calculated from site-disposal records and computer modeling. Selected objects were subjected to additional on-site measurements using a high-purity germanium detector. The germanium detector enabled specific radioisotope identification based on gamma-ray energies. It also provided a measure of the concentration of gamma-ray-emitting contaminants in soils and the activity of specific objects, based on prior calibration for both distributed and point sources. A large-area neutron detector checked for possible transuranic nuclides. Alpha and beta spectrometry also were tested, but their utility for this application was limited due to the short range of the particles and the difficulty of maintaining a repeatable measurement geometry in field measurements.

21024 (POEF-SH–29) **Evaluation of coverage of enriched UF_6 cylinder storage lots by existing criticality accident alarms.** Lee, B.L. Jr.; Dobelbower, M.C.; Woollard, J.E.; Sutherland, P.J.; Tayloe, R.W. Jr. Martin Marietta Energy Systems, Inc., Piketon, OH (United States). Mar 1995. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-76OR00001. Order Number DE95010274. Source: OSTI; NTIS; INIS; GPO Dep.

The Portsmouth Gaseous Diffusion Plant (PORTS) is leased from the US Department of Energy (DOE) by the United States Enrichment Corporation (USEC), a government corporation formed in 1993. PORTS is in transition from regulation by DOE to regulation by the Nuclear Regulatory Commission (NRC). One regulation is 10 CFR Part 76.89, which requires that criticality alarm systems be provided for the site. PORTS originally installed criticality accident alarm systems in all building for which nuclear criticality accidents were credible. Currently, however, alarm systems are not installed in the enriched uranium hexafluoride (UF_6) cylinder storage lots. This report analyzes and documents the extent to which enriched UF_6 cylinder storage lots at PORTS are covered by criticality detectors and alarms currently installed in adjacent buildings. Monte Carlo calculations are performed on simplified models of the cylinder storage lots and adjacent buildings. The storage lots modelled are X-745B, X-745C, X745D, X-745E, and X-745F. The criticality detectors modelled are located in building X-343, the building X-344A/X-342A complex, and portions of building X-330 (see Figures 1 and 2). These criticality detectors are those located closest to the cylinder storage lots. Results of this analysis indicate that the existing criticality detectors currently installed at PORTS are largely ineffective in detecting neutron radiation from criticality accidents in most of the cylinder storage lots at PORTS, except sometimes along portions of their peripheries.

21025 (RFP–4826) **Evaluation of residue drum storage safety risks.** Conner, W.V. EG and G Rocky Flats, Inc., Golden, CO (United States). Rocky Flats Plant. 17 Jun 1994. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90RF62349. Order Number DE95011899. Source: OSTI; NTIS; INIS; GPO Dep.

A study was conducted to determine if any potential safety problems exist in the residue drum backlog at the Rocky Flats Plant. Plutonium residues stored in 55-gallon drums were packaged for short-term storage until the residues could be processed for plutonium recovery. These residues have now been determined by the Department of Energy to be waste materials, and the residues will remain in storage until plans for disposal of the material can be developed. The packaging configurations which were safe for short-term storage may not be safe for long-term storage. Interviews with Rocky Flats personnel involved with packaging the residues reveal that more than one packaging configuration was used for some of the residues. A tabulation of packaging configurations was developed based on the information obtained from the interviews. A number of potential safety problems were identified

during this study, including hydrogen generation from some residues and residue packaging materials, contamination containment loss, metal residue packaging container corrosion, and pyrophoric plutonium compound formation. Risk factors were developed for evaluating the risk potential of the various residue categories, and the residues in storage at Rocky Flats were ranked by risk potential. Preliminary drum head space gas sampling studies have demonstrated the potential for formation of flammable hydrogen-oxygen mixtures in some residue drums.

21026 (SAND–94-0686) **Determination of kinetic coefficients for the simultaneous reduction of sulfate and uranium by Desulfovibrio desulfuricans bacteria.** Tucker, M.D. Sandia National Labs., Albuquerque, NM (United States). May 1995. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95011839. Source: OSTI; NTIS; INIS; GPO Dep.

Uranium contamination of groundwaters and surface waters near abandoned mill tailings piles is a serious concern in many areas of the western United States. Uranium usually exists in either the U(IV) or the U(VI) oxidation state. U(VI) is soluble in water and, as a result, is very mobile in the environment. U(IV), however, is generally insoluble in water and, therefore, is not subject to aqueous transport. In recent years, researchers have discovered that certain anaerobic microorganisms, such as the sulfate-reducing bacteria Desulfovibrio desulfuricans, can mediate the reduction of U(VI) to U(IV). Although the ability of this microorganism to reduce U(VI) has been studied in some detail by previous researchers, the kinetics of the reactions have not been characterized. The purpose of this research was to perform kinetic studies on Desulfovibrio desulficans bacteria during simultaneous reduction of sulfate and uranium and to determine the phase in which uranium exists after it has been reduced and precipitated from solution. The studies were conducted in a laboratory-scale chemostat under substrate-limited growth conditions with pyruvate as the substrate. Kinetic coefficients for substrate utilization and cell growth were calculated using the Monod equation. The maximum rate of substrate utilization (k) was determined to be 4.70 $days^{-1}$ while the half-velocity constant (K_s) was 140 mg/l COD. The yield coefficient (Y) was determined to be 0.17 mg cells/mg COD while the endogenous decay coefficient (k_d) was calculated as 0.072 $days^{-1}$. After reduction, U(IV) Precipitated from solution in the uraninite (UO_2) phase. Uranium removal efficiency as high as 90% was achieved in the chemostat.

21027 (SAND–94-3188C) **Successful remediation of four uranium calibration pits at Technical Area II, Sandia National Laboratories, Albuquerque, New Mexico, USA.** Conway, R. (Sandia National Labs., Albuquerque, NM (United States)); Wade, M.; Tharp, T.; Copland, J. Sandia National Labs., Albuquerque, NM (United States). [1994]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950917–1: 5. international conference on radioactive waste management and environmental remediation, Berlin (Germany), 3-9 Sep 1995). Order Number DE95006308. Source: OSTI; NTIS; INIS; GPO Dep.

The first remediation of an Environmental Restoration (ER) Project site at Sandia National Laboratories (SNL) was successfully conducted in May and June 1994 at Technical Area II. The removal action involved four Uranium Calibration Pits (UCPs) filled with radioactive or hazardous materials. The concrete culvert pits were used to test and calibrate borehole radiometric logging tools for uranium exploration. The removal action consisted of excavating and containerizing the pit contents and contaminated soil beneath the culverts, removing the four culverts, and backfilling the excavation. Each UCP removal had unique complexities. Sixty 208-L drums of solid radioactive waste and eight 208-L drums of liquid hazardous waste were generated during the VCM. Two of the concrete culverts will be disposed as radioactive waste and two as solid waste. Uranium-238 was detected in UCP-2 ore material at 746 pci/g, and at 59 pci/g in UCP-1 silica sand. UCP-4 was empty; sludge from UCP-3 contained 122 mg/L (ppm) chromium.

21028 (SAND–95-1246) **Kauai Test Facility hazards assessment document.** Swihart, A. Sandia National Labs., Albuquerque, NM (United States). May 1995. 369p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95013854. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy Order 55003A requires facility-specific hazards assessment be prepared, maintained, and used for emergency planning purposes. This hazards assessment document describes the chemical and radiological hazards associated with the Kauai Test Facility, Barking Sands, Kauai, Hawaii. The Kauai Test Facility's chemical and radiological inventories were screened according to potential airborne impact to onsite and offsite individuals. The air dispersion model, ALOHA, estimated pollutant concentrations downwind from the source of a release, taking into consideration the toxicological and physical characteristics of the release site, the atmospheric conditions, and the circumstances of the release. The greatest distance to the Early Severe Health Effects threshold is 4.2 kilometers. The highest emergency classification is a General Emergency at the "Main Complex" and a Site Area Emergency at the Kokole Point Launch Site. The Emergency Planning Zone for the "Main Complex" is 5 kilometers. The Emergency Planning Zone for the Kokole Point Launch Site is the Pacific Missile Range Facility's site boundary.

21029 (SAND–95-8216) **Radiological characterization plan for the Tritium Research Laboratory, Sandia National Laboratories/California.** Garcia, T. Sandia National Labs., Albuquerque, NM (United States). May 1995. 178p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95010746. Source: OSTI; NTIS; INIS; GPO Dep.

In this Radiological Characterization Plan (RCP), the Health Protection Department, 8641 of Sandia National Laboratories/California provides specific information for an assessment of the radiological conditions of Building 968, the Tritium Research Laboratory (TRL), and the TRL Complex area. This RCP provides historical background information on each laboratory within the TRL Complex as related to both radiological conditions and hazardous materials. Since this plan chronicles past and present activities and outlines future actions, a final complex status report will follow the completion of this document. The Health Protection Department, 8641 anticipates that the TRL Complex will ultimately undergo a termination survey; however, this RCP does not include environmental surveys such as soil, vegetation, or ground water. The RCP does provide the basis for a final termination survey plan, when appropriate.

21030 (UCRL-JC–119591) **Use of experience data for seismic evaluations at Department of Energy facilities.** Murray, R.C. (Lawrence Livermore National Lab., CA (United States)); Kimball, J.K.; Guzy, D.J.; Hill, J.R. Lawrence Livermore National Lab., CA (United States). 7 Dec 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-941227–5: 5. symposium on current issues related to nuclear power plant structure, equipment and piping, Orlando, FL (United States), 14-16 Dec 1994). Order Number DE95011741. Source: OSTI; NTIS; INIS; GPO Dep.

Seismic evaluations of essential systems and components at Department of Energy (DOE) facilities will be conducted over the next several years. For many of these systems and components, few, if any, seismic requirements applied to the original design, procurement, installation, and maintenance process. Thus the verification of the seismic adequacy of existing systems and components presents a difficult challenge. DOE has undertaken development of the criteria and procedures for these seismic evaluations that will maximize safety benefits in a timely and cost effective manner. As demonstrated in previous applications at DOE facilities and by the experience from the commercial nuclear power industry, use of experience data for these evaluations is the only viable option for most existing systems and components. This paper describes seismic experience data, the needs at DOE facilities, the precedent of application of nuclear power plants and DOE facilities, and the program underway for the seismic verification task ahead for DOE.

21031 (WHC-EP–0600-Rev.1) **Status report on resolution of Waste Tank Safety Issues at the Hanford Site. Revision 1.** Dukelow, G.T. (Los Alamos Technical Associates, Inc., Kennewick, WA (United States)); Hanson, G.A. Westinghouse Hanford Co., Richland, WA (United States); Los Alamos Technical Associates, Inc., Kennewick, WA (United States). May 1995. 207p. Sponsored

by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012985. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this report is to provide and update the status of activities supporting the resolution of waste tank safety issues and system deficiencies at the Hanford Site. This report provides: (1) background information on safety issues and system deficiencies; (2) a description of the Tank Waste Remediation System and the process for managing safety issues and system deficiencies; (3) changes in safety issue description, prioritization, and schedules; and (4) a summary of the status, plans, order of magnitude, cost, and schedule for resolving safety issues and system deficiencies.

21032 (WHC-SA–2746) **Deactivation and cleanout of the 308 Fuels Laboratory and the 232-Z Incinerator at the Hanford site.** Gerber, M.S.; Bliss, R.J. Westinghouse Hanford Co., Richland, WA (United States). Dec 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950216–138: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95008788. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the deactivation and source term reduction activities conducted over the recent past in two plutonium-contaminated Hanford Site buildings: the 308 Fuels Development Laboratory and the 232-Z Incinerator. Both of these facilities belong to the U.S. Department of Energy, and the projects are unique success stories carried out in direct support of EM-60 functions and requirements. In both cases the buildings, for different reasons, contained unacceptable amounts of plutonium, and were stabilized and placed in a safe, pre-D&D (decontamination and decommissioning) mode. The concept of deactivation as the last step in the operating life of a facility will be discussed. The need for and requirements of EM-60 transition between operations and D&D, the costs savings, techniques, regulations and lessons learned also will be discussed. This paper describes the strategies that led to successful source term reduction: accurate characterization, cooperation among different divisions within DOE and the Hanford Site, attention to regulations (especially unique in this case since the 232-Z Incinerator has been nominated as a Historic Structure to the National Register of Historic Places), and stakeholder concerns involving the proximity of the 308 Building to the Columbia River. The paper also weaves in the history, missions, and plutonium accumulation of the two buildings. The lessons learned are cogent to many other present and future deactivation activities across the DOE complex and indeed across the world.

21033 (WHC-SA–2792) **Implementation strategies for U.S. DOE Order 5480.28 Natural Phenomena Hazards Mitigation.** Conrads, T.J. Westinghouse Hanford Co., Richland, WA (United States). Jan 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950740–39: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95008789. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the strategies used by Westinghouse Hanford Company for implementing a new U.S. Department of Energy Order 5480.28, Natural Phenomena Hazards Mitigation. The order requires that all new and existing structures, systems, and components be designed and evaluated for the effects of natural phenomena (seismic, wind, flood, and volcano) applicable at a given site. It also requires that instrumentation be available to record the expected seismic events and that procedures be available to inspect facilities for damage following a natural phenomena event. This order requires that probabilistic hazards studies be conducted for the applicable natural phenomena to determine appropriate loads to be applied in a graded approach to structures, systems, and components important to safety. This paper discusses the processes, tasks, and methods used to implement this directive, which altered the standard design basis for new and existing structures, systems, and components at the Hanford Site. It also addresses a correlation between the performance category nomenclature of DOE Order 5480.28 and the safety classification described in DOE Order 5480.23, Nuclear Safety Analysis Reports. This correlation was deemed to be a prerequisite for the cost-effective implementation of the new DOE Order on natural phenomena hazards mitigation.

21034 (WHC-SA–2841) **Dose assessment from potential radionuclide emissions from stacks on the Hanford Site.** Davis, W.E.; Barnett, J.M. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-9505101–4: Conference on challenges and innovations in the management of hazardous waste, Washington, DC (United States), 10-12 May 1995). Order Number DE95011572. Source: OSTI; NTIS; INIS; GPO Dep.

On February 3, 1993, the US Department of Energy, Richland Operations Office (RL), received a Compliance Order and Information Request from the Director of the Air and Toxics Division of the US Environmental Protection Agency (EPA), Region 10. The Compliance Order required RL to (1) evaluate all radionuclide emission points at the Hanford Site to determine which points are subject to the continuous emission sampling requirements of Title 40, Code of Federal Regulations, Part 61 (40 CFR 61), Subpart H, and (2) continuously sample radionuclide emissions in accordance with requirements in 40 CFR 61.93. The Information Request required RL to provide a written Compliance Plan to meet the requirements of the Compliance Order. A Compliance Plan was submitted to EPA, Region 10, on April 30, 1993. The Compliance Plan specified that a dose assessment would be performed for 84 Westinghouse Hanford Company (WHC) stacks registered with the Washington State Department of Health on the Hanford Site. Any stack identified in the assessment as having potential emissions to cause an effective dose equivalent (EDE) to a maximum exposed individual (MEI) greater than 0.1 mrem y^{-1} must have a compliant sampling system. In addition, a Federal Facility Compliance Agreement (FFCA) was signed on. February 7, 1994. The FFCA required that all unregistered stacks on the Hanford Site be assessed. This requirement increased the number of stacks to be assessed to 123 stacks. Six methods for performing the assessments are described. An initial assessment using only the HEPA filtration factor for back calculations identified 32 stacks that would have emissions which would cause an EDE to the MEI greater than 0.1 mrem y^{-1}. When the other methods were applied the number was reduced to 20 stacks. The paper discusses reasons for these overestimates.

21035 (WHC-SD-CP-SA–026-Rev.1) **Seismic analyses of equipment in 2736-Z complex. Revision 1.** Ocoma, E.C. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 863p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012487. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the structural qualification for the existing equipment when subjected to seismic loading in the Plutonium Storage Complex. It replaces in entirety Revision 0 and reconciles the U.S. Department of Energy (DOE) comments on Revision 0. The Complex consists of 2736-Z Building (plutonium storage vault), 2736-ZA Building (vault ventilation equipment building), and 2736-ZB Building (shipping/receiving, repackaging activities). The existing equipment structurally qualified in this report are the metal storage racks for 7 inch and lard cans in room 2 of Building 2736-Z; the cubicles, can holders and pedestals in rooms 1, 3, and 4 of Building 2736-Z; the ventilation duct including exhaust fans/motors, emergency diesel generator, and HEPA filter housing in Building 2736-ZA; the repackaging glovebox in Building 2736-ZB; and the interface duct between Buildings 2736-Z and 2736-ZA.

21036 (WHC-SD-ER5480-ER–001) **Hanford facilities tracer study report (315 Water Treatment Facility).** Ambalam, T. (Kaiser Engineers Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); Kaiser Engineers Hanford Co., Richland, WA (United States). 14 Apr 1995. 93p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010870. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the results and findings of a tracer study to determine contact time for the disinfection process of 315 Water Treatment Facility that supplies sanitary water for the 300 Area.

The study utilized fluoride as the tracer and contact times were determined for two flow rates. Interpolation of data and short circuiting effects are also discussed. The 315 Water Treatment Facility supplies sanitary water for the 300 Area to various process and domestic users. The Surface Water Treatment Rule (SWTR), outlined in the 1986 Safe Drinking Water Act Amendments enacted by the EPA in 1989 and regulated by the Washington State Department of Health (DOH) in Section 246-290-600 of the Washington Administrative Code (WAC), stipulates filtration and disinfection requirements for public water systems under the direct influence of surface water. The SWTR disinfection guidelines require that each treatment system achieves predetermined inactivation ratios. The inactivation by disinfection is approximated with a measure called CxT, where C is the disinfectant residual concentration and T is the effective contact time of the water with the disinfectant. The CxT calculations for the Hanford water treatment plants were derived from the total volume of the contact basin(s). In the absence of empirical data to support CxT calculations, the DOH determined that the CxT values used in the monthly reports for the water treatment plants on the Hanford site were invalid and required the performance of a tracer study at each plant. In response to that determination, a tracer study will be performed to determine the actual contact times of the facilities for the CxT calculations.

21037 (WHC-SD-TP-RPT-015-Rev.1) **Transportation impact analysis for the shipment of low specific activity nitric acid. Revision 1.** Green, J.R. Westinghouse Hanford Co., Richland, WA (United States). 16 May 1995. 83p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013330. Source: OSTI; NTIS; INIS; GPO Dep.

This is in support of the Plutonium-Uranium Extraction (PUREX) Facility Low Specific Activity (LSA) Nitric Acid Shipment Environmental Assessment. It analyzes potential toxicological and radiological risks associated with transportation of PUREX Facility LSA Nitric Acid from the Hanford Site to Portsmouth VA, Baltimore MD, and Port Elizabeth NJ.

21038 (WHC-SD-W164-ATP-001) **Fire alarm system acceptance test procedure for Project W-164, Sample Equipment Cleaning Facility.** McKenna, P.J. Westinghouse Hanford Co., Richland, WA (United States). 17 Apr 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010941. Source: OSTI; NTIS; INIS; GPO Dep.

This Acceptance Test Procedure (ATP) has been prepared to demonstrate that the Fire Protection System functions as required by project criteria. The test results will be issued as an acceptance test report (ATR) after all testing is complete. Components that are covered by this procedure are the fire alarm control system, power transfer to battery backup, switching circuits, alarm input devices, and battery capacity and recharge capability. Bldg 6268 is part of the Effluent Treatment and Laboratory Project.

21039 (WHC-SD-W320-SUP-002) **Project W-320 ALARA Plan.** Harty, W.M. Westinghouse Hanford Co., Richland, WA (United States). 6 Jun 1995. 67p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014421. Source: OSTI; NTIS; INIS; GPO Dep.

This supporting document establishes the As Low As Reasonable Achievable (ALARA) Plan to be followed during Sluicing Project W-320 design and construction activities to minimize personnel exposure to radiation and hazardous materials.

21040 (WHC-SD-WM-ATP-125) **241-SY-101 Pump Decon System Acceptance Test Procedure.** Talachy, S.A.; Cleveland, K.J. Westinghouse Hanford Co., Richland, WA (United States). 12 Apr 1995. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010574. Source: OSTI; NTIS; INIS; GPO Dep.

The SY-101 Pump Decon System has components that consist of the water filter skid to assembly operation, the pump pit flooding system, and the system set up using air blow the water out of the decon hose. The Acceptance Test Procedure (ATP) consists of four parts. The first part will calibrate water and flow meters. The second part will determine the pressure loss on the water traveling through the filter skid at various flow rates. The third part will determine the length of time it takes to drain 1350 gallons of water out of a tank through 300 feet of discharge hose. The fourth part will verify that the calculated air volume and pressure in an air receiver is adequate to blow all the water out of a 2 inch diameter water hose.

21041 (WHC-SD-WM-ES-315) **T Plant canyon deck-level allowable floor-load study.** Barlow, D.E. Westinghouse Hanford Co., Richland, WA (United States). 19 Apr 1995. 104p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010942. Source: OSTI; NTIS; INIS; GPO Dep.

T Plant is to become a decontamination facility for the Hanford Site. This mission will require that large pieces of equipment be installed on the deck-level floor of the canyon in 221-T building. The objective of this study is to determine the maximum loads that can be applied safely to the canyon deck-level floor. These loads are caused by the weight of installed equipment. These load limits are to be used as design limits for the installation of the new equipment. The load limits for normal operating conditions are based on American Concrete Institute (ACI) 318.1 permissible stresses. The various floor configurations in building sections 1 through 20 are considered. Cover blocks are considered to be installed in all deck openings to create the worst possible case. The building is designated as safety class 3. The internal stresses, resulting from the inertial forces caused by the concrete during horizontal seismic accelerations, are out of scope for this report. They are considered in the seismic analysis of the building section. Vertical reactions when equipment is subjected to overturning moments during horizontal seismic accelerations must be determined and applied as part of the floor load. The new equipment to be installed has relatively small mass compared to the building weight, and there is a 25% reduction in the load factor during seismic events. Thus, the seismic effects are expected to be accommodated within the envelope of this static analysis.

21042 (WHC-SD-WM-FHA-010) **Fire hazard analysis of the radioactive mixed waste trenchs.** McDonald, K.M. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); Columbia Energy and Environmental Services, Inc., Richland, WA (United States). 27 Apr 1995. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011509. Source: OSTI; NTIS; INIS; GPO Dep.

This Fire Hazards Analysis (FHA) is intended to assess comprehensively the risk from fire associated with the disposal of low level radioactive mixed waste in trenches within the lined landfills, provided by Project W-025, designated Trench 31 and 34 of the Burial Ground 218-W-5. Elements within the FHA make recommendations for minimizing risk to workers, the public, and the environment from fire during the course of the operation's activity. Transient flammables and combustibles present that support the operation's activity are considered and included in the analysis. The graded FHA contains the following elements: description of construction, protection of essential safety class equipment, fire protection features, description of fire hazards, life safety considerations, critical process equipment, high value property, damage potential–maximum credible fire loss (MCFL) and maximum possible fire loss (MPFL), fire department/brigade response, recovery potential, potential for a toxic, biological and/or radiation incident due to a fire, emergency planning, security considerations related to fire protection, natural hazards (earthquake, flood, wind) impact on fire safety, and exposure fire potential, including the potential for fire spread between fire areas. Recommendations for limiting risk are made in the text of this report and printed in bold type. All recommendations are repeated in a list in Section 18.0.

21043 (WHC-SP-0564-36) **Westinghouse Hanford Company health and safety performance report. Fourth quarter calendar year 1994.** Lansing, K.A. Westinghouse Hanford Co., Richland, WA (United States). Mar 1995. 150p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008869. Source: OSTI; NTIS; GPO Dep.

Detailed information pertaining to As Low As Reasonably Achievable/Contamination Control Improvement Project (ALARA/CCIP) activities are outlined. Improved commitment to the WHC ALARA/CCIP Program was experienced throughout FY 1994. During CY

1994, 17 of 19 sitewide ALARA performance goals were completed on or ahead of schedule. Estimated total exposure by facility for CY 1994 is listed in tables by organization code for each dosimeter frequency. Facilities/areas continue to utilize the capabilities of the RPR tracking system in conjunction with the present site management action-tracking system to manage deficiencies, trend performance, and develop improved preventive efforts. Detailed information pertaining to occupational injuries/illnesses are provided. The Industrial Safety and Hygiene programs are described which have generated several key initiatives that are believed responsible for improved safety performance. A breakdown of CY 1994 occupational injuries/illnesses by type, affected body group, cause, job type, age/gender, and facility is provided. The contributing experience of each WHC division/department in attaining this significant improvement is described along with tables charting specific trends. The Radiological Control Program is on schedule to meet all RL Site Management System milestones and program commitments.

21044 (WHC-SP–0671-Rev.3) **Westinghouse Hanford Company ALARA year-end report, Calendar Year 1994: Revision 3, Radiological engineering and ALARA.** Berglund, O.D. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010571. Source: OSTI; NTIS; GPO Dep.

It has long been DOE's Policy that radiation exposures should be maintained as far below the dose limits as is reasonably achievable. This policy, known as the ALARA Principle of radiation protection, maintains that radiation exposures should be maintained as low as reasonably achievable, taking into account social, technical, economic, practical, and public policy considerations. The ALARA Principle is based on the hypothesis that even very low radiation doses carry some risk. As a result, it is not enough to maintain doses at/or slightly below limits; the lower the doses, the lower the risks. Because it is not possible to reduce all doses at DOE facilities to zero, economic and social factors must be considered to determine the optimal level of radiation doses. According to the ALARA principle, if doses are too high, resources should be well spent to reduce them. At some point, the resources being spent to maintain low doses are exactly balanced by the risks avoided. Reducing doses below this point results in a misallocation of resources; the resources could be spent elsewhere and have a greater impact on health and safety. The WHC ALARA sitewide goals were developed by the WHC ALARA Council and the ALARA/CCIP Program Office, while the facility/organizational level ALARA goals were developed by the facility/organizational ALARA committees. Goal statuses have been approved by facility management or their representative and transmitted verbatim in this report. These goals reflect a commitment by management to ensure a quality ALARA program driven by an emphasis on safety, the health of workers, and the protection of the environment. The final status, performance, and lessons learned of ALARA goals developed for Calendar Year (CY) 1994, are provided in this report.

21045 (WSRC-MS–94-0255) **The Savannah River Environmental Technology Field Test Platform: Phase 2.** Rossabi, J.; Riha, B.D.; Eddy-Dilek, C.A.; Pemberton, B.E.; May, C.P.; Jarosch, T.R.; Looney, B.B.; Raymond, R. Westinghouse Savannah River Co., Aiken, SC (United States). 14 Mar 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060138. Source: OSTI; NTIS; INIS; GPO Dep.

The principal goal in the development of new technologies for environmental monitoring and characterization is transferring them to organizations and individuals for use in site assessment and compliance monitoring. The DOE complex has devised several strategies to facilitate this transfer including joint research projects between private industries and government laboratories or universities (CRADAs) and streamlined licensing procedures. One strategy that has been under-utilized is a planned sequence gradually moving from laboratory development and field demonstration to long term evaluation and onsite use. Industrial partnership and commercial production can be initiated at any step based on the performance, market, user needs, and costs associated with the technology. This approach allows use of the technology by onsite groups for compliance monitoring tasks (e.g. Environmental Restoration and Waste Management), while following parallel research and development organizations the opportunity to evaluate the long term performance and to make modifications or improvements to the technology. This probationary period also provides regulatory organizations, potential industrial partners, and potential users with the opportunity to evaluate the technology's performance and its utility for implementation in environmental characterization and monitoring programs.

21046 (WSRC-MS–94-0628) **The visual and radiological inspection of a pipeline using a teleoperated pipe crawler.** Fogle, R.F. (Westinghouse Savannah River Co., Aiken, SC (United States). Savannah River Site); Kuelske, K.; Kellner, R. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9506178–1: International Association of Science and Technology for Development conference on robotics and manufacturing, Cancun (Mexico), 14-17 Jun 1995). Order Number DE95010964. Source: OSTI; NTIS; GPO Dep.

In the 1950s, the Savannah River Site built an open, unlined retention basin to temporarily store potentially radionuclide contaminated cooling water from a chemical separations process and storm water drainage from a nearby waste management facility that stored large quantities of nuclear fission byproducts in carbon steel tanks. The retention basin was retired from service in 1972 when a new, lined basin was completed. In 1978, the old retention basin was excavated, backfilled with uncontaminated dirt, and covered with grass. At the same time, much of the underground process pipeline leading to the basin was abandoned. Since the closure of the retention basin, new environmental regulations require that the basin undergo further assessment to determine whether additional remediation is required. A visual and radiological inspection of the pipeline was necessary to aid in the remediation decision making process for the retention basin system. A teleoperated pipe crawler inspection system was developed to survey the abandoned sections of underground pipelines leading to the retired retention basin. This paper will describe the background to this project, the scope of the investigation, the equipment requirements, and the results of the pipeline inspection.

21047 (BNL–61068) **INFCIRC/153 as the basis for verification of a special nuclear materials production cutoff convention.** Parsick, R.; Sanborn, J. Brookhaven National Lab., Upton, NY (United States). Aug 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95005933. Source: OSTI; NTIS; INIS; GPO Dep.

Although safeguards practice under the Nuclear Non-Proliferation Treaty (NPT) has evolved considerably over the lifetime of the agreement, INFCIRC/153 remains the defining document of NPT verification. It is the only available document that might be adopted as an element of a special nuclear materials production cutoff convention to define an "NPT-like" verification regime. The clearly stated objective of INFCIRC/153 safeguards is the ability to "detect diversion," which is achieved by verifying the state's nuclear material accounting system. Although the way in which the verification objectives of a cutoff convention will be formulated is not yet known, it is clear that there will not be an exact fit between the two. The mismatch becomes greater to the extent that material in declared facilities is "grandfathered" under cutoff. It also increases as a cutoff regime focuses verification on the physical process of production (in operating facilities) or on facility operational status or capability (at non-operating facilities) rather than on the nuclear material itself. This paper compares the technical objectives which may be assigned to the IAEA under a cutoff convention with those described in INFCIRC/153. It also deals with means and limitations of verification activities which are closely linked to these objectives. The broader political and legal objectives associated with the convention are not considered.

21048 (DOE/MD–0001) **Storage and disposition of weapons-usable fissile materials Programmatic Environmental Impact Statement. Scoping meeting comment summary report.** USDOE Office of Fissile Materials Disposition, Washington, DC (United States). 30 Nov 1994. 221p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95011045. Source: OSTI; NTIS; INIS; GPO Dep.

On September 27, 1993, President Clinton announced the establishment of a framework for US efforts to prevent proliferation of weapons of mass destruction. This policy commits the US to undertake a comprehensive approach to the growing accumulation of fissile materials from dismantled nuclear weapons and from within civil nuclear programs. In response to national policy, the Secretary of Energy, on January 24, 1994, created a Department wide project reporting to the Under Secretary, to focus on the control and disposition of surplus fissile materials and improve coordination of efforts within the Department concerning these fissile materials. Consequently, the Office of Fissile Materials Disposition was created and is responsible for all activities of the Department relating to the management, storage and disposition of fissile materials from weapons and weapons systems that are excess to the national security of the US.

21049 (LA–12929-MS) **IAEA safeguards for the Fissile Materials Disposition Project.** Close, D.A. Los Alamos National Lab., NM (United States). Jun 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95012976. Source: OSTI; NTIS; INIS; GPO Dep.

This document is an overview of International Atomic Energy Agency (IAEA) safeguards and the basic requirements or elements of an IAEA safeguards regime. The primary objective of IAEA safeguards is the timely detection of the diversion of a significant quantity of material and the timely detection of undeclared activities. The two important components of IAEA safeguards to accomplish their primary objective are nuclear material accountancy and containment and surveillance. This overview provides guidance to the Fissile Materials Disposition Project for IAEA inspection requirements. IAEA requirements, DOE Orders, and Nuclear Regulatory Commission regulations will be used as the basis for designing a safeguards and security system for the facilities recommended by the Fissile Materials Disposition Project.

21050 (LA–12941-T) **A research study to determine the perception of security awareness within Los Alamos National Laboratory.** Kerstiens, F.L. Los Alamos National Lab., NM (United States); Phoenix Univ., AZ (United States). Dept. of Organizational Management. Apr 1995. 117p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95010680. Source: OSTI; NTIS; INIS; GPO Dep.

The DOE is opening its doors and much of the Cold War secrets are being declassified. There still remains, however, much information which cannot be declassified at this time. The classified material which cannot be released coupled with new technology research and development still makes security a major issue within the DOE complex. Chapter 1 provides background information on the organizations involved in this research and a discussion of the problem. Three populations were selected for this research: EG and G/EM, a DOE contractor used by Los Alamos; a Los Alamos population of division identified as having committed a security infraction within the six months prior to this study; and a Los Alamos population who had not committed a security infraction during the same time frame. Since security within Los Alamos is still a major issue, the DOE periodically performs security audits to ensure DOE policies are being implemented and that security requirements are being met. This study analyzed security awareness perceptions and the possible relationship to infractions. Chapter 2 discusses other research that has been done in areas which relate directly to the seven hypotheses of this study. Chapter 3 deals with the methodology used to conduct the research. Surveys were sent out to randomly selected employees from each population. Chapter 4 discusses the collected data and presents the statistical results of the study. A detailed discussion of the data analyzed in Chapter 4 is presented in Chapter 5 with recommendations to management. This chapter also looks at the limitations of the study and the implications on future studies in this area.

21051 (LA–12964-MS) **Measuring the fill height of sealed cans with a compound pendulum.** Rinard, P.M. Los Alamos National Lab., NM (United States). Jun 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95012975. Source: OSTI; NTIS; INIS; GPO Dep.

A compound pendulum has been designed, fabricated, tested, and used to determine the fill height of material in sealed cans. The specific cans that stimulated this work are partially filled with uranium and plutonium oxide. Fill height affects nondestructive assays using fission neutrons, but corrections for various fill heights can be made once the height is known. Heights vary with use as the powder compacts or loosens, so it is necessary to determine the height at the time of the neutron measurement. The pendulum is small and readily portable so it can be taken to the location of the neutron measurement. Tests with open cans filled with sand to various known heights had accuracies generally within 3%. Factors that can affect the accuracy are examined and discussed. Experience in using the pendulum on sealed cans is related.

21052 (LA-UR–95-323) **Precision estimates for tomographic nondestructive assay.** Prettyman, T.H. Los Alamos National Lab., NM (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950923–1: 5. international conference on facility-safeguards interface, Jackson Hole, WY (United States), 24-30 Sep 1995). Order Number DE95006279. Source: OSTI; NTIS; GPO Dep.

Requirements for effective safeguards during the transition to environmental management at nuclear material production facilities within the DOE complex are deriving improvements in the accuracy of nondestructive assay (NDA) techniques. An important aspect of the transition is the need for facilities to terminate safeguards on waste materials, thus reducing the cost for safeguards at the facility. Requirements for the termination of safeguards on candidate waste material have been established by DOE to minimize the potential for diversion or theft of nuclear material. Because heterogenous waste and residue materials are stored in large containers such as 208-L drums, conventional assay techniques such as segmented gamma scanning (SGS) that were developed to assay small samples cannot always provide accurate measurements. Consequently, facilities using the conventional NDA instrumentation may be limited in their ability to discard waste materials in compliance with DOE requirements. One technique being applied to improve the accuracy of assays of waste in large containers is computerized tomography (CT). Research on the application of CT to improve both neutron and gamma-ray assays of waste is being carried out at Los Alamos National Laboratory. For example, tomographic gamma scanning (TGS) is a single-photon emission CT technique that corrects for attenuation of gamma rays emitted from the sample using attenuation images from transmission CT.

21053 (LA-UR–95-1282) **Production of an English/Russian glossary of terminology for nuclear materials control and accounting.** Schachowskoj, S.; Smith, H.A. Jr. Los Alamos National Lab., NM (United States). [1995]. 122p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95010852. Source: OSTI; NTIS; INIS; GPO Dep.

The program plans for Former Soviet Union National Nuclear Materials Control and Accounting (MC and A) Systems Enhancements call for the development of an English/Russian Glossary of MC and A terminology. This glossary was envisioned as an outgrowth of the many interactions, training sessions, and other talking and writing exercises that would transpire in the course of carrying out these programs. This report summarizes the status of the production of this glossary, the most recent copy of which is attached to this report. The glossary contains over 950 terms and acronyms associated with nuclear material control and accounting for safeguards and nonproliferation. This document is organized as follows: English/Russian glossary of terms and acronyms; Russian/English glossary of terms and acronyms; English/Russian glossary of acronyms; and Russian/English glossary of acronyms.

21054 (LA-UR–95-1393) **SR (Shift Register) COLLECT users manual. Version 2.00.** Hansen, W.; Painter, J.A.; Augustson, R.H. Los Alamos National Lab., NM (United States). 19 Dec 1994. 37p. Sponsored by USDOE, Washington, DC

(United States). DOE Contract W-7405-ENG-36. Order Number DE95012053. Source: OSTI; NTIS; GPO Dep.

SR COLLECT is intended to be used by International Energy Agency (IAEA) inspectors in facilities in Japan for remote unattended collection of data recorded by a shift register electronics unit. In addition, it will send a signal to a monitoring camera to record the occurrence of significant events. SR COLLECT organizes the collected data into a set of files that can be copied to floppy diskettes. The data copied to these diskettes can, in turn, be imported into the SR Review program for analysis. Unattended data collection requires a high degree of reliability. SR COLLECT is capable of restarting itself after loss of power to the collect computer. SR COLLECT is also capable of recovering from loss of communications with the shift electronics unit. Data is recorded in files on the hard disk immediately after it is collected. All significant events, called critical events, are recorded in a file. The set of parameters in effect is recorded in a file. Disk write caching is NOT used to prevent the loss of data caused by a sudden power failure.

21055 (PNL–D-410) **ADP Security Plan, Math Building, Room 1139.** Melton, R. Pacific Northwest Lab., Richland, WA (United States). 27 Aug 1985. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95012633. Source: OSTI; NTIS; GPO Dep.

This document provides the draft copy of an updated (ADP) Security Plan for an IBM Personal Computer to be used in the Math Building at PNL for classified data base management. Using the equipment specified in this document and implementing the administrative and physical procedures as outlined will provide the secure environment necessary for this work to proceed.

21056 (SAND–95-1038) **Smart gun technology requirements preliminary report.** Weiss, D.R.; Brandt, D.J.; Tweet, K.D. Sandia National Labs., Albuquerque, NM (United States). May 1995. 68p. Sponsored by National Inst. of Law Enforcement and Criminal Justice, Washington, DC (United States). DOE Contract AC04-94AL85000. Contract IAA-94-IJ-R-021. Order Number DE95013886. Source: OSTI; NTIS; GPO Dep.

Goal of the Smart Gun Technology project is to eliminate the capability of an unauthorized user from firing a law enforcement officer's firearm by implementing user-recognizing-and-authorizing surety technologies. This project is funded by the National Institute of Justice. This document reports the projects first objective: to find and document the requirements for a user-recognizing-and-authorizing firearm technology that law enforcement officers will value. This report details the problem of firearm takeaways in law enforcement, the methodology used to develop the law enforcement officers' requirements, and the requirements themselves.

21057 (UCRL-ID–119970) **Decision model for evaluating reactor disposition of excess plutonium.** Edmunds, T. Lawrence Livermore National Lab., CA (United States). Feb 1995. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95011527. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy is currently considering a range of technologies for disposition of excess weapon plutonium. Use of plutonium fuel in fission reactors to generate spent fuel is one class of technology options. This report describes the inputs and results of decision analyses conducted to evaluate four evolutionary/advanced and three existing fission reactor designs for plutonium disposition. The evaluation incorporates multiple objectives or decision criteria, and accounts for uncertainty. The purpose of the study is to identify important and discriminating decision criteria, and to identify combinations of value judgments and assumptions that tend to favor one reactor design over another.

21058 (UCRL-ID–120749) **Plutonium-bearing materials feed report for the DOE Fissile Materials Disposition Program alternatives.** Brough, W.G. (Lawrence Livermore National Lab., CA (United States)); Boerigter, S.T. Lawrence Livermore National Lab., CA (United States). 6 Apr 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95011721. Source: OSTI; NTIS; INIS; GPO Dep.

This report has identified all plutonium currently excess to DOE Defense Programs under current planning assumptions. A number of material categories win clearly fan within the scope of the MD (Materials Disposition) program, but the fate of the other categories are unknown at the present time. MD planning requires that estimates be made of those materials likely to be considered for disposition actions so that bounding cases for the PEIS (Programmatic Environmental Impact Statement) can be determined and so that processing which may be required can be identified in considering the various alternatives. A systematic analysis of the various alternatives in reachmg the preferred alternative requires an understanding of the possible range of values which may be taken by the various categories of feed materials. One table identifies the current total inventories excess to Defense Program planning needs and represents the bounding total of Pu which may become part of the MD disposition effort for all materials, except site return weapons. The other categories, principally irradiated fuel, rich scrap, and lean scrap, are discussed. Another table summarizes the ranges and expected quantities of Pu which could become the responsibility of the MD program. These values are to be used for assessing the impact of the various alternatives and for scaling operations to assess PEIS impact. Determination of the actual materials to be included in the disposition program will be done later.

21059 (WSRC-MS–94-0575) **Plutonium Disposition Now!.** Buckner, M.R. Westinghouse Savannah River Co., Aiken, SC (United States). 24 May 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950919–1: ANS international conference on evaluation of emerging nuclear fuel cycle systems, Versailles (France), 11-14 Sep 1995). Order Number DE95060147. Source: OSTI; NTIS; INIS; GPO Dep.

A means for use of existing processing facilities and reactors for plutonium disposition is described which requires a minimum capital investment and allows rapid implementation. The scenario includes interim storage and processing under IAEA control, and fabrication into MOX fuel in existing or planned facilities in Europe for use in operating reactors in the two home countries. Conceptual studies indicate that existing Westinghouse four-loop designs can safety dispose of 0.94 MT of plutonium per calendar year. Thus, it would be possible to consume the expected US excess stockpile of about 50 MT in two to three units of this type, and it is highly likely that a comparable amount of the FSU excess plutonium could be deposed of in a few VVER-1000's. The only major capital project for this mode of plutonium disposition would be the weapons-grade plutonium processing which could be done in a dedicated international facility or using existing facilities in the US and FSU under IAEA control. This option offers the potential for quick implementation at a very low cost to the governments of the two countries.

This conference involves subjects of radiation physics, implementation of ICRP, egypt air radioactive sources and radon daughters measurement. it contains figures, tables and data.

21061 (NUREG/CR–0200-Vol.1-Rev.4) **SCALE: A modular code system for performing standardized computer analyses for licensing evaluation. Control modules – Volume 1, Revision 4.** Landers, N.F. (Oak Ridge National Lab., TN (United States)); Petrie, L.M.; Knight, J.R. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Industrial and Medical Nuclear Safety; Oak Ridge National Lab., TN (United States). Apr 1995. 767p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/NUREG/CSD–2/R4-Vol.1). Source: OSTI; NTIS; GPO; INIS.

SCALE–a modular code system for Standardized Computer Analyses Licensing Evaluation–has been developed by Oak Ridge National Laboratory at the request of the US Nuclear Regulatory Commission. The SCALE system utilizes well-established computer codes and methods within standard analysis sequences that (1) allow an input format designed for the occasional user and/or novice, (2) automate the data processing and coupling between modules, and (3) provide accurate and reliable results. System development has been directed at problem-dependent cross-section processing and analysis of criticality safety, shielding, heat transfer, and depletion/decay problems. Since the initial release of SCALE in 1980, the code system has been heavily used for evaluation of nuclear fuel facility and package designs. This revision documents Version 4.2 of the system. This manual is divided into three volumes: Volume 1–for the control module documentation, Volume 2–for the functional module documentation, and Volume 3 for the documentation of the data libraries and subroutine libraries.

21062 (NUREG/CR–0200-Vol.2-Pt.1-Rev.4) **SCALE: A modular code system for performing standardized computer analyses for licensing evaluation. 21063 (LA–12944-MS) **Use of the Los Alamos Hot-Cell Facility for target fabrication and separation of molybdenum-99.** Field, L.; Ledbetter, J.; Knobeloch, D. Los Alamos National Lab., NM (United States). Apr 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95010553. Source: OSTI; NTIS; GPO Dep.

Congress has tasked the Department of Energy (DOE) with developing a domestic source of the radioisotope molybdenum-99 (^{99}Mo) for use by the medical research community. At present, there are no commercial facilities in the United States that are capable of producing ^{99}Mo, and few DOE facilities have suitable reactor and hot-cell facilities for the extraction and purification of the isotopes. This report addresses the implementation of a limited-term ^{99}Mo production program at Los Alamos National Laboratory. We present our proposal for generating ^{99}Mo: the fabrication and processing of uranium targets at Los Alamos and the irradiation of targets at Sandia National Laboratories. Los Alamos already has a hot-cell facility that can be readily converted to the production of ^{99}Mo and other commercially important radioisotopes, such as iodine-131 and xenon-131. Because the ^{99}Mo production process will be combined into an already existing facility, the cost of developing this capability is much lower than any other alternative being considered by the DOE. In this report, we describe the ^{99}Mo production process, provide a cost analysis for converting the hot-cell facility, and outline the schedule necessary to implement this capability to meet current DOE plans. Also discussed in this report are issues related to the hot-cell operations, including waste management, the transportation of targets between Los Alamos and Sandia, and the shipment of ^{99}Mo to radiopharmaceutical companies.

21064 **Molecular separation method and apparatus.** Villa-Aleman, E. To Dept. of Energy. 1993. Filed date 6 Jan 1993. U.S. Patent Application 8-002,352. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95009954. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A method and apparatus are disclosed for separating a gaseous mixture of chemically identical but physically different molecules based on their polarities. The gaseous mixture of molecules is introduced in discrete quantities into the proximal end of a porous glass molecular. The molecular sieve is exposed to microwaves to excite the molecules to a higher energy state from a lower energy state, those having a higher dipole moment being excited more than those with a lower energy state. The temperature of the sieve kept cold by a flow of liquid nitrogen through a cooling jacket so that the heat generated by the molecules colliding with the material is transferred away from the material. The molecules thus alternate between a higher energy state and a lower one, with the portion of molecules having the higher dipole moment favored over the others. The former portion can then be extracted separately from the distal end of the molecular sieve.

2.edition (compiled and revided).

The present report is prepared for planners of radiation processing of any material. Calculations are focused on accelerators of electrons, divided into two groups: versatile linacs of energy up to 13 MeV, and accelerators of lower energy, below 2 MeV, of better energy yield but of limited applications. The calculations are connected with the confrontation of the author's technological expectations during the preparation of the linac project in the late '60s, with the results of 25 years of exploitation of the machine. One has to realize that from the 200 kW input power from the mains, only 5 kW of bent and scanned beam is recovered on the conveyor. That power is only partially used for radiation induced phenomena, because of the demanded homogeneity of the dose, of the mode of packing of the object and its shape, of edges of the scanned area and in the spaces between boxes, and of loses during the idle time due to the tuning of the machine and dosimetric operations. The use of lower energy accelerators may be more economical than that of linacs in case of objects of specific type. At the first stage already, that is of the conversion of electrical power into that of low energy electron beam, the yield is 2-3 times better than in the case of linacs. Attention has been paid to the technological aspects of electron beam conversion into the more penetrating Bremsstrahlung similar to gamma radiation. The advantages of technologies, which make possible a control of the shape of the processed object are stressed. Special attention is focused to the relation between the yield of processing and the ratio between the maximum to the minimum dose in the object under the irradiation. (author). 14 refs, 14 figs.

21066 (LA-UR–95-1486) **Quasi-optical gyrotron materials processing at Los Alamos.** Katz, J.D.; Rees, D.E. Los Alamos

National Lab., NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950401–5: 97. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 30 Apr - 1 may 1995). Order Number DE95011994. Source: OSTI; NTIS; GPO Dep.

Los Alamos has recently obtained and installed quasi-optical gyrotrons of 37 and 84 GHz with power outputs up to 35 kW. A quasi-optical gyrotron is unique in that the output is a Gaussian beam which can be focused and manipulated using mirrors. The Gaussian beam output is ideally suited for one and two dimensional materials processing applications such as joining and surface treatment. Working with the National Center for Manufacturing Sciences (NCMS) we have formed a consortium of companies to investigate several materials processing applications.

The objective of this research is to optimize conditions for the enzymatic production of hydrogen gas from biomass-derived glucose. This new project is funded at 0.5 PY level of effort for FY 1995. The rationale for the work is that cellulose is, potentially, a vast source of hydrogen and that enzymes offer a specific and efficient method for its extraction with minimal environmental impact. This work is related to the overall hydrogen program goal of technology development and validation. The approach is based on knowledge that glucose is oxidized by the $NADP^+$ requiring enzyme glucose dehydrogenase (GDH) and that the resulting NADPH can donate its electrons to hydrogenase (H_2ase) which catalyzes the evolution of H_2. Thus hydrogen production from glucose was achieved using calf liver GDH and Pyrococcus furiosus H_2ase yielding 17% of theoretical maximum expected. The cofactor $NADP^+$ for this reaction was regenerated and recycled. Current and future work includes understanding the rate limiting steps of this process and the stabilization/immobilization of the enzymes for long term hydrogen production. Cooperative interactions with the Universities of Georgia and Bath for obtaining thermally stable enzymes are underway.

21068 (DOE/GO/10039–2) **Solar powered hydrogen generating facility and hydrogen powered vehicle fleet. Technical progress report, October 1, 1994–December 31, 1994.** Provenzano, J.J. Clean Air Now, Santa Monica, CA (United States). Feb 1995. 78p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC36-94GO10039. Order Number DE95009193. Source: OSTI; NTIS; GPO Dep.

The status of the project is updated.

21069 (DOE/GO/10039–T1) **Solar powered hydrogen generating facility and hydrogen powered vehicle fleet. Technical progress report, January 1, 1995–March 31, 1995.** Provenzano, J.J. Clean Air Now, Santa Monica, CA (United States). Project Office. Apr 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC36-94GO10039. Order Number DE95013838. Source: OSTI; NTIS; GPO Dep.

The project proceeded generally according to schedule, with most of the work directed at procurement of materials, initiation of equipment fabrication by contractors, and development of educational materials. The first vehicle retrofit was completed in March 1995, and prepared for delivery to DOE's Energy Technology Engineering Center.

0802 Storage, Transport, and Handling

21070 (LA-UR–95-1370) **Sn-substituted $LaNi_5$ alloys for metal hydride electrodes.** Wasz, M.L. (Los Alamos National Lab., NM (United States). Center for Materials Science); Schwarz, R.B.; Srinivasan, S.; Sridhar Kumar, M.P. Los Alamos National Lab., NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950412–10: Spring meeting of the Materials Research Society (MRS), San Francisco, CA (United States), 17-21 Apr 1995). Order Number DE95012059. Source: OSTI; NTIS; GPO Dep.

This research examines the efficacy of tin additions to $LaNi_5$ in improving the hydrogen storage capacity of the material during charging/discharging. Alloys were prepared using high energy ball milling (mechanical alloying), a technique superior to arc casting for alloying elements with a wide disparity in melting points. Characterization by X-ray diffraction and Rietveld analysis shows that tin preferentially occupies the Ni(3g) sites in the $LaNi_5$ structure, and the unit cell volume increases linearly with tin content to the maximum tin solubility of 7.33 atomic percent ($LaNi_{4.56}Sn_{0.44}$). The authors found that powders prepared by mechanical alloying and not exposed to air require no activation to induce hydrogen absorption. The hydrogen storage capacity in the gas and electrochemical phase was measured as a function of tin content. They found that with increasing tin, the plateau pressure decreases logarithmically, whereas the hydrogen storage capacity decreases linearly.

With relation to bagasse as biomass resource, surplus power and economic efficiency were examined when producing electric power from bagasse in case of changing the purpose of using bagasse in sugar manufacturing plants from steam as main product/power as secondary product to power as main/steam as secondary. Surplus power in the sugar manufacturing plant is made salable to the commercial power system. In the trial design, it is clarified that in case of a sugar manufacturing plant processing sugarcane of 1,000 tons/day, the existing power generation capacity, 1,140 kW, increases by approximately three times to 3,340 kW at maximum. Judging from the worldwide annual bagasse production of 1.65 million tons against the annual cane sugar production of 75.033 million tons, the worldwide potential power generation capacity to be brought by the system will actually be 7.68 million kW even if steam needed for processing in the sugar manufacturing plant is surely obtained from bagasse. If aged boiler facilities of sugar manufacturing plants in the world' main sugar producing countries are renewed in this design idea, effects of the system will be immeasurably enormous. 42 figs., 55 tabs.

0908 Production

21072 (CONF-9411229–1) **Bioenergy: What's in it for the grower? The cost of producing dedicated energy crops. Comparisons with conventional crops.** Walsh, M. Oak Ridge National Lab., TN (United States). [1994]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Preparing for rural energy and economic development; Knoxville, TN (United States); 9-10 Nov 1994. Order Number DE95012880. Source: OSTI; NTIS; GPO Dep.

Dedicated energy crops must be at least as profitable as conventional crops that could be grown on a given site before farmers will produce energy crops on that site. This report concentrates on the cost of producing dedicated energy crops and compare those costs to the profitability of conventional crops. This comparison allows one to estimate a breakeven price, that is, a price for which the profitability of dedicated energy crops is equivalent to the profitability of conventional crops. Switchgrass and hybrid poplar have been chosen as representative herbaceous and woody crop species for the estimation.

21073 (DOE/NV/11432–T6) **Performance of stem flow gauges in greenhouse and desert environments.** Levitt, D.G. (Reynolds Electrical and Engineering Co., Inc., Las Vegas, NV (United States)); Simpson, J.R.; Tipton, J.L. Reynolds Electrical and Engineering Co., Inc., Las Vegas, NV (United States). [1995]. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-94NV11432. Order Number DE95013095. Source: OSTI; NTIS; GPO Dep.

This study was conducted to evaluate the accuracy and general performance of a heat balance method for estimating transpirational sap flow through plant stems on two tree species in greenhouse and field experiments in Tucson, Arizona. Sap flow through 20-mm diameter stems of oak (Quercus virginiana 'Heritage') and mesquite (Prosopis alba 'Colorado'.) trees in containers was measured using stem flow gauges and a precision balance, from January to October, 1991. Overall gauge accuracy, and the effects of gauge location on the tree stem, gauge ventilation, gauge insulation, sheath conductance factor (Ksh) selection method, and increased numbers of vertical thermocouple pairs on gauge performance were evaluated.

21074 (DOE/CE/40905–57) **Development of a prototype lignin concentration sensor. Final report.** Jeffers, L.A. Babcock and Wilcox Co., Alliance, OH (United States). Research and Development Div. Nov 1994. 206p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC05-90CE40905. Order Number DE95010951. Source: OSTI; NTIS; GPO Dep.

The workscope covered in this report is the first step toward the development of an instrument for the on-line measurement of lignin concentration in wood pulp. This first-step program consisted of a series of laboratory measurements of the fluorescence spectra of well-defined pulp samples. The objective of the program was to develop the data base necessary to design a field-testable prototype instrument, to define the range of conditions over which the prototype can be expected to provide satisfactory performance, and to provide the background for interpretation of the results obtained when field testing the prototype.

21075 (DOE/GO–10095-089) **Biomass Power: Program overview fiscal years 1993–1994.** National Renewable Energy Lab., Golden, CO (United States). Mar 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE94000241. Source: OSTI; NTIS; GPO Dep.

The Biomass Power Program and industry are developing technologies to expand the use of biomass that include methods of feedstock production and the equipment to convert feedstocks into electric power or process heat. With the help of advanced biomass power technologies and new feedstock supply systems, as much as 50,000 megawatts (MW) of biomass power capacity will be in place by the year 2010. The Biomass Power Program supports the development of three technologies–gasification, pyrolysis, and direct combustion–from the laboratory bench scale to the prototype commercial scale. Gasification equipment produces biogas that is burned in high-efficiency turbine-generators developed for the electric power industry. Pyrolysis processes produce oils from renewable biomass that burn like petroleum to generate electricity. In direct combustion technology, power plants today burn bulk biomass directly to generate electricity. Improving the direct combustion technology of these plants increases efficiency and reduces emissions. In addition to developing these three technologies, the Biomass Power Program supports joint ventures to plan and construct facilities that demonstrate the benefits of biomass power. The Program is supporting joint ventures to conduct 10 case studies of dedicated feedstock supply systems.

21076 (DOE/GO–10095-166) **Biomass power: An old resource for a new technology.** National Renewable Energy Lab., Golden, CO (United States). May 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95004081. Source: OSTI; NTIS; GPO Dep.

As many as 50,000 MW of electricity could be generated by biomass power plants in the year 2010 with advanced technologies and improved feedstock supplies. This pamphlet describes the current status and capacity of biomass power plants in the US, advanced technologies under development, a way to guarantee a dedicated fuel supply, and sources for further information.

21077 (ETDE-DE–124) **Transverse flow micro-filtration with vibrating modules to retain biomass on woven materials. Final report.** Dortmund Univ. (Germany). Fachbereich Chemietechnik. 29 Jan 1993. 26p. (In German). Sponsored by Arbeitsgemeinschaft Industrieller Forschungsvereinigungen e.V., Koeln (Germany). Contract AIF 8042. Order Number DE95780303. Source: OSTI; NTIS (US Sales Only).

To increase the spatial/temporal yield in bio-technological fermentation, continuous transverse flow micro-filtration is available among the filtration processes. The times of use of filter materials were examined by applying mechanical vibrations in the range of 10 to 120 Hz. It was found that the vibration-supported filtration only showed an increase of the filtration flow in purely toplayer controlled systems. Blocking of the pores of a filter material could not be prevented by the effect of vibration. The twisted weaves examined did not show the required degrees of separation for biological suspensions. (BBR)

21078 (ETDE-DE–142) **New supporting materials for cell immobilisation. Final report.** Technische Hochschule Koethen (Germany). Inst. fuer Biologie und Biochemie. [1993]. 9p. (In German). Sponsored by Arbeitsgemeinschaft Industrieller Forschungsvereinigungen e.V., Koeln (Germany). Contract AIF 42D. Order Number DE95786064. Source: OSTI; NTIS (US Sales Only).

As an alternative to the commonly used yrast-immobilising matrices of ionotrope polysaccharide gel (e.g. Ca alginate) we used 1-1.5 mm spherical, depigmented, delipidated specimen of the duckweed Wolffia arrhiza. Fermentation was conducted in a fluidised-bed bioreactor according to the procedural principles of fluidised bed reactors. Progressively larger quantities starting from 0.1 l to 6.5, 9 and then 10 l posed no problems. Volumetric productivities of P = 55-65 g ethanol/l.h were obtained using saccharose (140 g/l) as a substrate, immobilised baker's yeast (saccharomyces cerevisiae), a dilution rate of 0.75-1.3 h^{-1} and a biomass fraction of approx. 80 g HTS/l support. The system is suitable for long-time fermentation (tested for up to 200 days). (orig./EF)

21079 (GSF–01/95) **Energy from renewable raw materials. Seminar materials of Zentrale Informationsstelle Umweltberatung Bayern. Vol. 5.** Kohmanns, B. (comp.); Littmann, A. (comp.); Haury, H.J. (comp.). GSF - Forschungszentrum fuer Umwelt und Gesundheit Neuherberg GmbH, Oberschleissheim (Germany). Jan 1995. 76p. (In German). Sponsored by Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany). (CONF-9409350–: 4. seminar of Zentrale Informationsstelle Umweltberatung Bayern: Energy from renewable raw materials, Nuernberg (Germany), 22 Sep 1994). Order Number DE95779579. Source: OSTI; NTIS (US Sales Only).

The potential of energy production from biomass is reviewed, including environmental effects and aspects of environmental policy. The processes of vegeteable oil production are reviewed, as well as its applications and environmental impact. The process of biogas production by means of anaerobic digestion of waste is described, and a performance report is given for a bark-fuelled heating power station. (orig.)

This volume contains the abstracts of oral and poster presentations made at the Seventeenth Symposium on Biotechnology for Fuels and Chemicals. Session titles include Thermal, Chemical, and Biological Processing; Applied Biological Research; Bioprocessing Research; Special Topics Discussion Groups; Process Economics and Commercialization; and Environmental Biotechnology.

0910 Properties and Composition

21081 (NEI-DK–2010) **Combustion of polluted waste wood. Investigation of environmentally pollutive substances issuing from waste incineration plants with or without the addition of polluted waste wood to the volume of waste.** Energiministeriets Forskningsudvalg for produktion og fordeling af el og varme. Braendsler og forbraendingsteknik. Terkildsen, L. Dk-Teknik, Soeborg (Denmark). Dec 1994. 128p. (In Danish). Contract ENS-1323/91-0020. Order Number DE95779221. Source: OSTI; NTIS.

EFP-91.

Waste wood which has been used for outdoor constructions is often impregnated with protective substances such as coal tar, arsenic, copper, chromium and/or pentachlorophenol. Currently in Denmark this kind of waste wood must be brought to a special depot. It is suggested that it would be better to burn it so that it could be used to produce energy (this would also save time and money otherwise used on sorting processes) but the environment must be protected from the resulting pollutive and poisonous emission. It has been calculated that by 2015 there will be 400.000 tons of this kind of impregnated waste wood, taken from torn-down buildings in Denmark, which could make up 4-5% of total fuel consumption. The aim of the project was to discover whether it would be possible to use polluted waste wood as fuel for the production of electricity and heating in a non-pollutive way. Investigations were carried out on the combustion of waste woods at a Danish waste incineration plant. Results are presented in detail. It was found that copper almost always ran out into the slag, that chromium, manganese and nickel usually ran out into the slag, that cadmium was almost always found in the waste product, that arsenic and lead usually ended in the waste product and that mercury was most often found in the flue gas. There was an increased risk of the formation of dioxins. It was also found that if the moisture content of the waste wood was ca. 25% (the same as ordinary waste) it would be possible to add ca. 14 w/w % of wood to the wastes to be incinerated and still retain optimal combustion. (AB) (17 refs.)

EFP-89.

The project has developed a vision system for the combustion on a Voelund 'cigar-burner' (straw combustion) on the Haslev cogeneration plant. The system has been connected to the process control system of the power plant and can prevent the formation of projecting unburned areas on the burning bale. The system is configurable and can be adapted to other geometries and combustion processes. A rugged and compact camera house and flange system for monitoring of combustion processes has been developed. The best supervision of the combustion processes, is obtained with a fast shutter speed infra-red CCD camera. The project has been accomplished in five phases: the development of a rugged monitoring system for the straw fired 'cigar burners' at Haslev cogeneration plant, trials with video recordings of relevant combustion patterns, the development of a realtime computer program for analysis of video pictures of relevant situations of the burners, testing of picture analysis program at Haslev co-generation plant and testing the entire vision system. The stickiness of the straw ashes is decisive for the cooling conditions around the camera housing. The vision system developed could soon detect the formation of unburned, advanced regions on the 'cigar burner'. Through an automatic change of the feed rate the burner was brought back to the optimal combustion pattern. The installation of video monitoring or computer vision on plants with combustion of solid fuels, can optimize the combustion process and prevent shut-downs. dk-TEKNIK has also tested the video monitoring system at several combustion plants burning different kinds of biomass. (AB)

21084 (NEI-DK–2000) **Testing of the superheater materials for waste and biofuel boiler systems.** Energiministeriets Forskningsudvalg for produktion og fordeling af el og varme. Braendsler og forbraendingsteknik. Teilslev, B. (Voelund R and D Center (Denmark)); Nielsen, V.; Jansen, P.; Andersen, F.; Gotthjaelp, K.; Broendsted, P. Risoe National Lab., Roskilde (Denmark). Materials Dept. Apr 1995. 92p. (In Danish). Contract ENS-1323/93-0012. Order Number DE95779200. Source: OSTI; NTIS.

EFP-93.

In the EFP93- project 'Testing of superheater materials for refuse- or biofuel fueled boilers' various prospective overheater materials were tested in order to determine conditions for achievement of improved steam parameters in biomass-fueled boilers. Overheater materials were exposed as a corrosion probe to flue gas action in a temperature range from 475 to 575 deg.C. Flue gas was produced by combustion of wastes or straw in the boiler. In these conditions Ni-Cr alloy steels were proved to have lower corrosion rate then the low alloy steel 15Mo3. The Ni-Cr alloys generally have the same resistance, and no correlation between corrosion and Ni+Cr contents was observed. Compared to Ni-Cr alloy steels, the Ni Alloy 625 shows the best corrosion rate. Differences in the flue gas composition and temperature cause essential differences in corrosive losses, depending on various boiler- and fuel types. Flue gas from waste incineration was found to be far more corrosive than flue gas from straw combustion. However the respective corrosive properties within the same group of alloys remain the same irrespective of differences in exposure environment. (EG)

21085 (NEI-DK–2016) **Cleaning flue gas from smaller straw-fired boilers by using electric filters. Sub-report, phase 1. Collecting information.** Nielsen, C. Dk-TEKNIK, Soeborg (Denmark). Energi og Miljoe. Jan 1995. 139p. (In Danish). Contract ENS-51161-94.0032. Order Number DE95779212. Source: OSTI; NTIS.

Electric filters can be used for cleaning flue gas from straw-fuelled heating plants established on farms. The technique is explained. The sub-project aims at collecting information on this subject. No literature on electric filters used on small straw-fired heating plants was found. The four plants in Denmark that utilized these filters declared them satisfactory when flue gas temperature is under 130 grades, and emission was not more that 40-50 mg/

m^3,n. One firm in Germany and one in Austria manufactures electric filters suitable for small straw-fired heating plants located on farms. Technical details of these filters, and the names of the two firms are given. It is the aim of the main project to develop an electric filter for the purpose described above, and to prove that its use will reduce the emission of dusts etc. from straw-fuelled plants in accordance with Danish environmental demands. (AB)

Sponsored by: NTH. Division of Thermal Energy and Nordic Council of Ministers.

The report comprises a collection of papers from a seminar arranged as a part of the Nordic Energy Research Program. The aim of this program is to strengthen the basic competence in the energy field at universities and research organizations in the Nordic countries. In the program 1991-1994 six areas are selected for cooperation such as energy and society, solid fuels, district heating, petroleum technology, bioenergy and environment, and fuel cells. The topics deal both with biomass combustion and gasification, and combustion of municipal solid waste (MSW) and refuse derived fuel (RDF). A number of 11 papers are prepared. 97 refs., 91 figs., 11 tabs.

21087 (NEI-NO–569, pp. 61-77) **Formation and reduction of nitric oxides from fixed bed combustion of wood.** Keller, R. (Swiss Federal Inst. of Technology, Zuerich (Switzerland)). Nordisk Ministerraad. 1993. (CONF-9308267–: Nordic seminar on biomass gasification and combustion, Trondheim (Norway), 30 Aug 1993). In *Nordic seminar on biomass gasification and combustion.* 322p. Order Number DE95779284. Source: OSTI; NTIS.

Sponsored by: NTH. Division of Thermal Energy and Nordic Council of Ministers.

Nitric oxides (NO) from wood combustions originate mainly from the nitrogen contained in the wood. The goal of this work is to minimize the NO formation during the staged combustion of wood. For this study a special 25 kW test reactor which consists of the fixed bed gasification chamber, the reduction chamber and the combustion chamber was built. Concentrations of carbon, hydrogen and nitrogen in particle along the axis of the fixed bed and the distribution of the fuel nitrogen on gasification gases were determined. Under optimized staged combustion conditions with a heated reduction chamber and a residence time of 0.5 s NO_2 emissions from wood combustion were reduced from 200 mg/m^3 (at 11% O_2) to 93 mg/m^3. With multiple staged combustion of wood NO_2 emissions of 74 mg/m^3 can be achieved. 11 refs., 14 figs.

Source: OSTI; NTIS.

Sponsored by: NTH. Division of Thermal Energy and Nordic Council of Ministers.

The present paper describes a computer model for the calculation of the steady and non-steady behaviour of surface combusting straw bales. The mathematical formulation is one-dimensional and the flow of gas through the straw bales is described by means of Darcy's law for flow through a porous medium. The model treats important phenomena such as evaporation, condensation and diffusion of water, pyrolysis of straw, combustion of gas, combustion of straw char, thermal radiation, heat conduction in the straw, and straw-gas heat transfer. The straw bale properties such as porosity, permeability and water content may vary with time and the location in the bale. Numerical experiments show that the results obtained with the model exhibit trends similar to those that would be expected and which have been observed in preliminary experiments. 7 refs., 6 figs.

21089 (NEI-NO–569, pp. 187-199) **Modelling of black liquor pyrolysis.** Saastamoinen, J. (Technical Research Centre of Finland. Combustion and Thermal Engineering Lab., Jyvaeskylae (Finland)). Nordisk Ministerraad. 1993. (CONF-9308267–: Nordic seminar on biomass gasification and combustion, Trondheim (Norway), 30 Aug 1993). In *Nordic seminar on biomass gasification and combustion.* 322p. Order Number DE95779284. Source: OSTI; NTIS.

Sponsored by: NTH. Division of Thermal Energy and Nordic Council of Ministers.

The paper describes a mathematical model for pyrolysis of black liquor droplets in high temperature atmosphere. Black liquor as a fuel has similarities to different liquid fuels as heavy fuel oil droplet, multicomponent liquid fuel and coal water slurry. Models for heavy fuel oil, coal water slurry and multicomponent liquid fuel vaporization and pyrolysis have been presented. The black liquor droplets contain a great amount of water and the drying and pyrolysis occurs partly simultaneously according to calculations based on the present model even when the droplet size is small. The black liquor droplets swell significantly during drying and pyrolysis. The droplet volume increases to a size about 30 times the original size. The model presented here is based on a previous model used for wood particle pyrolysis. The combustion properties of black liquor have recently been studied. 7 refs., 5 figs., 1 tab.

21090 (SH-IR–1995-50) **Optimization of combustion in smaller straw-fired boilers. Testing of HZT oxygen control.** Kristensen, J.K. (Forskningscenter Bygholm, Afd. for Jordbrugsteknik, Sektion for Maskinteknik (Denmark)); Heide Joergensen, M. Statens Husdyrbrugsforsoeg, Copenhagen (Denmark). May 1995. 18p. (In Danish). Contract ENS-51161-94.0032. Order Number DE95779211. Source: OSTI; NTIS.

A system (originated by Hans Z. Thellesen. (HZT)) which measures the content of oxygen in smoke from burning straw, and which following regulates the stoking of the straw in accordance with the air volume, is tested. The control system incorporates an oxygen probe, ('Lambda Sonde' manufactured by Bosch) which, via a frequency module, is connected to a computer programme. It was found efficient in stabilizing the combustion of the straw by stoking-dosage regulation in relation to the content of oxygen in the smoke. There was also a slight improvement of boiler efficiency, but emission of carbon monoxide and dust remained the same when using this system. Because of variations in the quality of the straw fuelled, it is normally necessary to continually adjust a combustion system, and this is why the HZT system is particularly useful, both in making such constant adjustments unnecessary and by the fact that it conduces stable combustion which, in its turn, produces less air pollutants. If the oxygen sensor registers carbon monoxide the system sends more oxygen into the flue gas, and this normally reduces the content of carbon monoxide. By the use of this system, energy consumption for the operation of the electric motors is reduced by 20%. The HZT system is robust and needs no maintenance. Registration by the oxygen sensor is not influenced by variations in flue gas temperature or by condensation in the flue gas outlet at shutdown. (AB)

0950 Environmental Aspects

21091 (NEI-DK–2015) **Development of air-treatment plant Linkogas 1993.** Linkogas AmbA, Lintrup (Denmark). Sep 1994. 16p. (In Danish). Contract ENS-51161-93.0072. Order Number DE95779210. Source: OSTI; NTIS; INIS.

One of the first larger biomass conversion plants built in South Jutland, Denmark (1990) was designed to take 300 tons of animal manure and 60 tons of industrial waste per 24 hrs. The bio air-filter proved unsatisfactory and neighbours complained of a very unpleasant smell. Other methods of air cleaning were also tried out with little success, and the plant was threatened with closure. Finally the air extraction system was totally retrofitted. The new extractor sucked air from the tanks (the pressure was held at 0 - minus 1 mm Vs). The extracted air was used up in the boiler, and combustion here was continual. If the combustion should discontinue the extracted air is lead through the bio- and coal-fiber filters. The conversion and design are described. There have since been only one or two complaints about unpleasant odour, and these

problems have been dealt with by ordinary servicing and/or detection and closing of leaks. (AB)

21092 (NEI-DK–2032) **Gasification versus combustion of solid wastes. Environmental aspects. Main report.** Stenholm, M. (ed.); Dalager, S.; Kristensen, O. Dk-TEKNIK, Soeborg (Denmark). Energi og Miljoe; Voelund R og D Center, Kolding (Denmark); Dansk Teknologisk Inst., Taastrup (Denmark). Apr 1994. 93p. (In Danish). Order Number DE95787770. Source: OSTI; NTIS; INIS.

The project covers the three main areas of fuel (a designation for that part of the total volume of Danish solid waste that is not reused and could thus be utilized as fuel for energy production) waste combustion and gasification of wastes. The expected volume and nature of solid wastes in Denmark up to 2000 is described and the wastes' suitability for gasification is evaluated. Investigations were undertaken of plants for gasification and pyrolysis of biomass in Europe, USA and Canada in order to evaluate technology development there, especially with regard to the use of wastes as fuel. The processes were compared. It was concluded that combustion had the advantage as no commercial waste gasification plants were found in connection with this investigation. Commercial two-stage combustion was examined in USA and Canada. This can compete with combustion plants on the question of price and emission. The authors still consider that gasification, dependent on the extent of financial resources available, could be an important alternative to combustion. (AB) 12 refs.

21093 (NEI-DK–2033) **Gasification versus combustion of solid wastes. Environmental aspects. Supplementary report.** Stenholm, M. (ed.); Dalager, S.; Kristensen, O. Dk-TEKNIK, Soeborg (Denmark). Energi og Miljoe; Voelund R og D Center, Kolding (Denmark); Dansk Teknologisk Inst., Taastrup (Denmark). Apr 1994. 89p. (In Danish). Order Number DE95787771. Source: OSTI; NTIS; INIS.

The report is supplementary to the main one of the same title and contains detailed descriptions of the plants for gasification and pyrolysis of biomass visited in Europe, Canada and USA in order to evaluate the technology development, especially with regard to the use of solid wastes as fuel. (AB)

21094 (NEI-DK–2034) **Ashes from straw and wood-chip fired plants for agricultural usage. Pilot project.** Morsing, M. (Forskningscentret for Skov og Landskab (Denmark)); Westborg, S. Forskningscentret for Skov og Landskab, Lyngby (Denmark). Aug 1994. 44p. (In Danish). Contract ENS-51161-94.0006. Order Number DE95787767. Source: OSTI; NTIS; INIS.

The content of nutrients and heavy metals in ashes from the combustion of straw and wood chips at district heating plants is studied, on the basis of results of analyses from Danish municipalities, to determine whether such ashes are suitable for use as fertilizers. Results of the analysis of ashes from 9 wood-chip fired and 26 straw-fired plants are presented. They show significant variations in nutrient and heavy metal content which could be caused by combustion and operational conditions and/or testing methods. On condition that the phosphorous content of straw and wood-chip ashes amount to 1% of the dry matter, 50%-75% of the straw ashes and under 50% of wood chip ashes analyses are within the limit for cadmium stipulated in the Danish Ministry of the Environment's Executive Order no. 736 on the use of wastes for agricultural purposes. This is found to be unsatisfactory. It is suggested that a closer investigation should be undertaken in order to determine which amount of straw and wood-chip ashes can be accepted for use as fertilizers in consideration of the stipulated limits for cadmium content of wastes to be used for agricultural purposes. In addition the technological and economic potentials of dosing of these ashes for this use should be investigated. Fly ash and slag were also included in the analysis results studied and it was found that the cadmium content of slag did not prevent its use as fertilizer, but that the distribution of cadmium in slag, in fly ash and in slam from flue gas cleaning systems related to the combustion of wood chips should be further investigated. (AB)

21095 (NEI-NO–569, pp. 81-87) **Greenhouse gas emissions from wood stoves.** Karlsvik, E. (Norwegian Inst. of Technology. Foundation for Scientific and Industrial Research (Norway)); Hustad, J.E.; Skreiberg, Oe.; Soenju, O.K. Nordisk Ministerraad. 1993. (CONF-9308267–: Nordic seminar on biomass gasification and combustion, Trondheim (Norway), 30 Aug 1993). In *Nordic seminar on biomass gasification and combustion.* 322p. Order Number DE95779284. Source: OSTI; NTIS; INIS.

Sponsored by: NTH. Division of Thermal Energy and Nordic Council of Ministers.

The present paper deals with the use of biomass for energy in Scandinavia. It accounts for 127 TWh (457 PJ) which is 9% of the total energy consumption. Combustion of biomass is CO_2-neutral in the greenhouse effect balance. However, emissions of NO_x, N_2O, CO and CH_4 contribute either direct or indirect to the greenhouse effect. Experiments have been performed in three different wood stove units, a traditional stove and two new stoves. The two new stoves consist of a staged combustion unit and a catalytic stove. The emissions of NO_x, N_2O, CO and UHC in addition to O_2 and CO_2 are measured with continuous analyzers. The emissions of NO_x tend to decrease (in ppm) during the combustion cycle, while the emissions during the combustion cycle in g/kg wood increase in the charcoal phase compared to the pyrolysis phase. The average NO_x emissions are higher for the catalytic stove than for the staged stove, but the average CO and UHC emissions are lower. The emissions of N_2O are in general low, below 10 ppm. The total emissions of greenhouse gases for different wood stoves are calculated and compared to oil combustion. 9 refs., 12 figs., 1 tab.

21096 (NEI-NO–569, pp. 89-114) **Emissions from RDF combustion.** Rosvold, H. (Stiftelsen for Industriell og Teknisk Forskning (SINTEF). Applied Thermodynamics, Trondheim (Norway)). Nordisk Ministerraad. 1993. (CONF-9308267–: Nordic seminar on biomass gasification and combustion, Trondheim (Norway), 30 Aug 1993). In *Nordic seminar on biomass gasification and combustion.* 322p. Order Number DE95779284. Source: OSTI; NTIS; INIS.

Sponsored by: NTH. Division of Thermal Energy and Nordic Council of Ministers.

The paper deals with the emissions from refuse derived fuel (RDF) combustion. The disposal of refuse has during the last years been a matter of increasing concern for many municipalities. The environment options for waste disposal has not been focusing much. This means that first the waste generation must be reduced. Then recycling of a portion of the waste must be considered before a solution with combustion of waste is chosen. Two methods are currently in use for the combustion of municipal solid waste (MSW) which are the mass burning of unprocessed MSW and RDF. The RDF product consists of the burnable organic fraction of raw MSW. In contrast to mass burning systems, the RDF-system is pre-processing the raw MSW to make a more homogeneous fuel product. By processing the MSW, it is possible to recover RDF and other materials. The RDF process is a low cost approach to resource recovery. RDF is a merchant fuel, and can be used in existing boilers alone or as a supplement to conventional fuels as oil and coal. It is important that the RDF processing technology and RDF quality matches the energy user requirements. The RDF-processing-systems is of great importance to the RDF quality. The paper shows the different steps in the RDF process. 4 refs., 15 figs.

21097 (NEI-NO–569, pp. 115-131) **Influence of aerodynamics on combustion efficiency and NO_x emission.** Collin, R. Nordisk Ministerraad. 1993. (In Swedish). (CONF-9308267–: Nordic seminar on biomass gasification and combustion, Trondheim (Norway), 30 Aug 1993). In *Nordic seminar on biomass gasification and combustion.* 322p. Order Number DE95779284. Source: OSTI; NTIS; INIS.

Sponsored by: NTH. Division of Thermal Energy and Nordic Council of Ministers.

The paper deals with the improvement of combustion techniques in order to minimize the emission of NO_x from biomass-fuelled ovens and boilers. Four methods are referred to covering stepwise air-adding, recycling of exhaust gases, stepwise adding of fuel, and finally the injection of ammonia or urea etc. The injection method reduces NO to N_2. The verification of model tests and mathematical modelling are discussed in connection with two industrial projects on waste combustion using the methods of recycling and urea injection. 2 refs., 13 figs.

21098 (NEI-NO–569, pp. 133-144) **Pressurized biomass combustion with respect of wood fuel.** Jaanu, K. (Technical Research Centre of Finland. Combustion and Thermal Engineering Lab., Jyvaeskylae (Finland)); Orjala, M. Nordisk Ministerraad. 1993. (CONF-9308267–: Nordic seminar on biomass gasification and combustion, Trondheim (Norway), 30 Aug 1993). In *Nordic seminar on biomass gasification and combustion.* 322p. Order Number DE95779284. Source: OSTI; NTIS; INIS.

Sponsored by: NTH. Division of Thermal Energy and Nordic Council of Ministers.

The paper deals with a research project investigating the reactivities of three different wood fuels, particle size less than 500 microns in a pressurized entrained flow reactor. The major issues have been the combustion efficiency related to unburned carbon, risk of slagging, alkali balance, and the reduction of gaseous emissions like CO, NO_x and SO_2 from gas turbines by varying the temperature and pressure level. 8 refs., 13 figs., 2 tabs.

21099 (NEI-NO–569, pp. 201-229) **Emissions from small scale biofuel combustion. Research needs.** Gustavsson, L. (Statens Provningsanstalt (Sweden)); Karlsson, M.L.; Larfeldt, J.; Leckner, B. Nordisk Ministerraad. 1993. (In Swedish). (CONF-9308267–: Nordic seminar on biomass gasification and combustion, Trondheim (Norway), 30 Aug 1993). In *Nordic seminar on biomass gasification and combustion.* 322p. Order Number DE95779284. Source: OSTI; NTIS; INIS.

Sponsored by: NTH. Division of Thermal Energy and Nordic Council of Ministers.

The paper deals with the exhaust gas emission from small-sized boilers or cylindrical iron stoves. The biomass-fuelled boilers and stoves are designed for district heating or space heating. The boilers, which are equipped with ceramic lining or water cooling systems, have an output of up to 10 MW. The required limits of tar emissions are to be 30 mg/MJ and 40 mg/MJ for the boilers and stoves respectively. The paper discusses the demand of further improvements in minimizing the emission of volatile organic compounds (VOC) and NO_x. 15 refs., 11 figs., 1 tab.

21100 (NREL/TP–433-7867) **Environmental impacts of thermochemical biomass conversion. Final report.** Elliott, D.C. (Pacific Northwest Lab., Richland, WA (United States)); Hart, T.R.; Neuenschwander, G.G.; McKinney, M.D.; Norton, M.V.; Abrams, C.W. National Renewable Energy Lab., Golden, CO (United States); Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 142p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95009210. Source: OSTI; NTIS; INIS; GPO Dep.

Thermochemical conversion in this study is limited to fast pyrolysis, upgrading of fast pyrolysis oils, and gasification. Environmental impacts of all types were considered within the project, but primary emphasis was on discharges to the land, air, and water during and after the conversion processes. The project discussed here is divided into five task areas: (1) pyrolysis oil analysis; (2) hydrotreating of pyrolysis oil; (3) gas treatment systems for effluent minimization; (4) strategic analysis of regulatory requirements; and (5) support of the IEA Environmental Systems Activity. The pyrolysis oil task was aimed at understanding the oil contaminants and potential means for their removal. The hydrotreating task was undertaken to better define one potential means for both improving the quality of the oil but also removing contaminants from the oil. Within Task 3, analyses were done to evaluate the results of gasification product treatment systems. Task 4 was a review and collection of regulatory requirements which would be applicable to the subject processes. The IEA support task included input to and participation in the IEA Bioenergy activity which directly relates to the project subject. Each of these tasks is described along with the results. Conclusions and recommendations from the overall project are given.

21101 (ANL/ET/CP–84639) **Mixed-conducting ceramic membranes for partial oxygenation of methane.** Balachandran, U. (Argonne National Lab., IL (United States)); Dusek, J.T.; Maiya, P.S.; Mieville, R.L.; Kleefisch, M.S.; Udovich, C.A.; Bose, A.C. Argonne National Lab., IL (United States). May 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950401–9: 97. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 30 Apr - 1 may 1995). Order Number DE95013375. Source: OSTI; NTIS; GPO Dep.

The most significant cost associated with the conventional partial oxidation of methane is that of an oxygen plant. Our new technology offers a way to lower this cost, and in this paper we explore the technology that is based on dense ceramic membranes and that uses air as the oxidant for methane-conversion reactions. Mixed-conducting ceramic materials have been produced from mixed-oxide systems of the La-Sr-Fe-Co-O (SFC) type, in the form of tubes and bars. Thermodynamic stability of the tubes was studied as a function of oxygen partial pressure by high-temperature XRD. Mechanical properties were measured and found to be adequate for a reactor in the case of SFC-2: Electronic and ionic conductivities were measured; SFC-2 is unique in the sense that the ratio of ionic to electronic conductance is close to unity. Performance of the membrane tubes was good only with SFC-2. Fracture of other SFC tubes was the consequence of an oxygen gradient that introduced a volumetric lattice difference between the inner and outer walls. SFC-2 tubes provided methane conversion efficiencies of >99% in a reactor. These tubes have operated for >1000 h.

21102 (DOE/MC–00098-95/C0463) **Steady-state and transient catalytic oxidation and coupling of methane.** Iglesia, E.; Perry, D.L.; Heinemann, H. Lawrence Berkeley Lab., CA (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-950494–21: Natural gas research, development and demonstration contractors review meeting, Baton Rouge, LA (United States), 4-6 Apr 1995). Order Number DE95012321. Source: OSTI; NTIS; GPO Dep.

This project addresses the conversion of methane from natural gas into ethane, ethylene and higher hydrocarbons. Our research explores the mechanistic and practical implications of carrying out the methane oxidative coupling reaction in reactor designs other than conventional packed-beds with co-fed reactants. These alternate reactor designs are needed to prevent the full oxidation of methane, which limits C_2, yields in methane oxidative coupling reactions. The research strategy focuses on preventing contact between the 0_2 reactant required for favorable overall thermodynamics and the C_{2+} products of methane coupling. The behavior of various reactor designs are simulated using detailed kinetic transport models. These simulations have suggested that the best way to prevent high CO_2 yields is to separate the oxygen and hydrocarbon streams altogether. As a result, the project has focused on the experimental demonstration of proton transport membrane reactors for the selective conversion of methane into higher hydrocarbons.

21103 (DOE/MC–26029-95/C0461) **Catalytic conversion of light alkanes: Proof of concept stage.** Lyons, J.E. Sun Co., Inc., Marcus Hook, PA (United States). Research and Development Dept. [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-90MC26029. (CONF-950494–14: Natural gas research, development and demonstration contractors review meeting, Baton Rouge, LA (United States), 4-6 Apr 1995). Order Number DE95012318. Source: OSTI; NTIS; GPO Dep.

During the stage at which this work ended, our program consisted of two phases which were running concurrently, a research phase and a proof-of-concept phase. The function of the research phase is to design synthesize and perform laboratory tests on new materials in order to enhance the catalytic properties of the suprabiotic systems generated in our laboratories. Increases in catalytic activity and process selectivity as well as extensions of structure-activity relationships are examined. The research phase is intended to provide the process development phases with catalysts having superior properties for light alkane oxidation. The second concurrent phase, is the proof-of-concept phase. In this phase process development of oxidations which have succeeded in the research phase are carried out in a pre-pilot PDU. At the conclusion of the cooperative agreement we were developing a process for the conversion of isobutane to (TBA), We have identified two routes for this transformation: a one-step route directly from isobutane to TBA, and a two-step route in which the isobutane is oxidized first to tert-butyl hydroperoxide and then transformed into TBA catalytically. This paper presents the results of these activities.

21104 (DOE/MC/29228–95/C0462) **Selective methane oxidation over promoted oxide catalysts.** Klier, K.; Herman, R.G. Lehigh Univ., Bethlehem, PA (United States). [1995]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG21-92MC29228. (CONF-950494–12: Natural gas research, development and demonstration contractors review meeting, Baton Rouge, LA (United States), 4-6 Apr 1995). Order Number DE95012319. Source: OSTI; NTIS; GPO Dep.

Principal accomplishments have been achieved in all three areas of selective catalytic oxidation of methane that have been pursued in this research project. These accomplishments are centered on the development of catalyst systems that produce high space time yields of C_2 hydrocarbon products, formaldehyde, and methanol from methane/air mixtures at moderate temperatures and at ambient pressure. The accomplishments can be summarized as the following: the $SO_4^{2-}/SrO/La_2O_3$ catalyst developed here has been further optimized to produce 2 kg of C_2 hydrocarbons/kg catalyst/hr at 550C; $V_2O_5SiO_2$ catalysts have been prepared that produce up to 1.5 kg formaldehyde/kg catalyst/hr at 630C with CO_2 selectivities; and a novel dual bed catalyst system has been designed and tested that produces over 100 g methanol/kg catalyst/hr at 600C.

21105 (DOE/PC/92112–T9) **Novel catalysts for methane activation. Quarterly report No. 9, October 1, 1994–December 31, 1994.** Hirschon, A.S.; Wu, H.J.; Malhotra, R.; Wilson, R.B. SRI International, Menlo Park, CA (United States). 20 Apr 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC92112. Order Number DE95014323. Source: OSTI; NTIS; GPO Dep.

Fullerenes are a recently discovered allotrope of carbon that have been found to possess unusual properties, some of which may be ideal for methane activation. This project is designed to evaluate these carbon-based materials for conversion of methane into higher hydrocarbons. The project is divided into three technical tasks. Task 1 deals with synthesis and characterization of the fullerenes and fullerene soots, Task 2 with testing of the catalysts, and Task 3 with evaluation of the results and technical reporting. The results and accomplishments for this quarter are as follows: Reconstituted fullerene soot was prepared by adding C_{60} to a toluene-extracted Terrasimco fullerene soot; K-doped fullerene soots of different potassium concentrations were prepared; Fullerene soot doped with cesium was prepared by addition of cesium carbonate; The reconstituted fullerene soot was tested for methane activation. K-doped soots at different K concentrations were tested for methane activation. K-doped soot was examined for methane activation in the presence of co-feeds of either ethane or ethylene; a higher selectivity to C_3 and C_4 hydrocarbons was observed for the K-soot than when these reactions were conducted using soot as a catalyst, or when thermally induced. The Cs-doped soot was tested for methane activation; the selectivity for hydrocarbons from the methane conversion catalyzed by this soot was found to be higher than catalyzed by fullerene soot but lower than by K-soot.

21106 (DOE/PC/92113–T7) **Methane coupling by membrane reactor, Quarterly technical progress report, September 1994–December 24, 1994.** Ma, Yi Hua. Worcester Polytechnic Inst., MA (United States). 14 Apr 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC92113. Order Number DE95012418. Source: OSTI; NTIS; GPO Dep.

Experimental studies presented in this report discuss the performance of porous VYCOR membrane reactors in which the oxidative coupling of methane was carried out in an excess of oxygen. This was accomplished by shortening the porous section of the membrane reactor and operating at lower W/F ratios. Results are also discussed from experiments in which methane gas flow was metered in from the high pressure shell side into the oxygen stream on the tube side of the membrane reactor. These studies indicated that the presence of gas phase oxygen downstream to the catalyst bed was detrimental for the C_2 selectivity in the methane coupling reaction. Dense membrane synthesis and characterization results are presented which describe new approaches to dense membrane synthesis. Modifications to the 40 Angstrom pore diameter gamma alumina membranes to enhance their stability and pore filling of micron size pores on alpha alumina supports are discussed. $Sr_{0.8}La_{0.2}FeO_3$, an oxygen conducting perovslcite synthesized in the Microfluidizer showed interesting DSC (Differential Scanning Calorimetry) and TGA (Thermo Gravimetric Analysis) spectra that indicated a change in the crystal structure at relatively moderate temperatures of 150°C and 350°C. This report also presents details of the design and experimental set-up of a catalytic membrane reactor in which the porous membrane is doped with the active catalyst and methane coupling occurs as the reactant gases pass through the membrane pores.

21107 (NREL/TP–425-7607) **The origin and fate of organic pollutants from the combustion of alternative fuels.** National Renewable Energy Lab., Golden, CO (United States); Dayton Univ., OH (United States). Research Inst. Jun 1995. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95009232. Source: OSTI; NTIS; INIS; GPO Dep.

The overall objective of this project is to determine the impact of alternative fuels on air quality, particularly ozone formation. The objective will be met through three steps: (1) qualitative identification of alternative fuel combustion products, (2) quantitative measurement of specific emission levels of these products, and (3) determination of the fate of the combustion products in the atmosphere. The alternative fuels of interest are methanol, ethanol, natural gas, and LP gas. The role of the University of Dayton Research Institute (UDRI) in this project is two-fold. First, fused silica flow reactor instrumentation is being used to obtain both qualitative identification and quantitative data on the thermal degradation products from the fuel-lean (oxidative), stoichiometric, and fuel-rich (pyrolytic) decomposition of methanol, ethanol, liquefied petroleum gas, and natural gas. Secondly, a laser photolysis/laser-induced fluorescence (LP/LIF) apparatus is being used to determine the rates and mechanisms of reaction of selected degradation products under atmospheric conditions. This draft final report contains the results of the second year of the study. The authors initially discuss the results of their flow reactor studies. This is followed by a discussion of the initial results from their LP/LIF studies of the reaction of hydroxyl (OH) radicals with methanol and ethanol. In the coming year, they plan to obtain quantitative data on the oxidation of methyl-t-butyl-ether and reformulated gasoline under fuel-lean, stoichiometric, and fuel-rich conditions. They also plan to conduct a mechanistic analysis of the reaction of OH with acetaldehyde and formaldehyde over an extended temperature range.

13 HYDRO ENERGY

1305 Economic, Industrial and Business Aspects

21108 (ANL/DIS/CP–85855) **Optimizing hourly hydro operations at the Salt Lake City Area integrated projects.** Veselka, T.D. (Argonne National Lab., IL (United States)); Hamilton, S.; McCoy, J. Argonne National Lab., IL (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950414–2: 57. annual American power conference, Chicago, IL (United States), 18-20 Apr 1995). Order Number DE95012925. Source: OSTI; NTIS; INIS; GPO Dep.

The Salt Lake City Area (SLCA) office of the Western Area Power Administration (Western) is responsible for marketing the capacity and energy generated by the Colorado Storage, Collbran, and Rio Grande hydropower projects. These federal resources are collectively called the Salt Lake City Area Integrated Projects (SLCA/IP). In recent years, stringent operational limitations have been placed on several of these hydropower plants including the Glen Canyon Dam, which accounts for approximately 80% of the SLCA/IP resources. Operational limitations on SLCA/IP hydropower plants continue to evolve as a result of decisions currently being made in the Glen Canyon Dam Environmental Impact Statement (EIS) and the Power Marketing EIS. To analyze a broad range of issues associated with many possible future operational restrictions, Argonne National Laboratory (ANL), with technical assistance from Western has developed the Hydro LP (Linear Program) Model. This model simulates hourly operations at SLCA/IP hydropower plants for weekly periods with the objective of maximizing Western's net revenues. The model considers hydropower operations for the purpose of serving SLCA firm loads, loads for special projects, Inland Power Pool (IPP) spinning reserve requirements, and Western's purchasing programs. The model estimates hourly SLCA/IP generation and spot market activities. For this paper, hourly SLCA/IP hydropower plant generation is simulated under three operational scenarios and three hydropower conditions. For each scenario an estimate of Western's net revenue is computed.

1306 Environmental Aspects

21109 (DOE/EA–0934) **Snake River Sockeye Salmon Sawtooth Valley Project: Conservation & rebuilding program: Supplemental final environmental assessment.** USDOE Bonneville Power Administration, Portland, OR (United States). Mar 1995. 47p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012244. Source: OSTI; NTIS; GPO Dep.

This document announces Bonneville Power Administration's (BPA) proposal to fund three separate but interrelated actions which are integral components of the overall Sawtooth Valley Project to conserve and rebuild the Snake River Sockeye salmon run in the Sawtooth Valley of south-central Idaho. The three actions are as follows: (1) removing a rough fish barrier dam on Pettit Lake Creek and constructing a weir and trapping facilities to monitor future sockeye salmon adult and smolt migration into and out of Pettit Lake; (2) artificially fertilizing Readfish Lake to enhance the food supply for Snake River sockeye salmon juveniles released into the lake; and (3) trapping kokanee fry and adults to monitor the fry population and to reduce the population of kokanee in Redfish Lake. BPA has prepared a supplemental EA (included) which builds on an EA compled in 1994 on the Sawtooth Valley Project. Based on the analysis in this Supplemental EA, BPA has determined that the proposed actions are not major Federal actions significantly affecting the quality of the human environment. Therefore an Environmental Impact Statement is not required.

21110 (DOE/EA–0940) **Hellsgate Winter Range: Wildlife Mitigation Project. Final Environmental Assessment.** USDOE Bonneville Power Administration, Portland, OR (United States). Mar 1995. 82p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012404. Source: OSTI; NTIS; INIS; GPO Dep.

BPA proposes to fund the Hellsgate Winter Range: Wildlife Mitigation Project (Project) in a cooperative effort with the Colville Confederated Tribes and the Bureau of Indian Affairs (BIA). The Project is intended to mitigate for wildlife and wildlife habitat adversely affected by the construction of Grand Coulee and Chief Joseph Dams and their reservoirs. The Project would allow the sponsors to secure land and conduct wildlife habitat improvement and long-term management activities within the boundaries of the Colville Indian Reservation. BPA has prepared an Environmental Assessment (EA) (DOE/EA-0940) evaluating the potential environmental effects of the proposed Project (Alternative B) and No Action (Alternative A). Protection and re-establishment of riparian and upland habitat on the Colville Indian Reservation, under Alternative B, would not have a significant adverse environmental impact because: (1) there would be only limited, mostly short-term adverse impacts on soils, water quality, air quality, vegetation, and wildlife (including no effect on endangered species); and (2) there would be no adverse effect on water quantity, cultural resources, or land use. Based on the analysis in the EA, BPA has determined that the proposed action is not a major Federal action significantly affecting the quality of the human environment, within the meaning of the National Environmental Policy Act (NEPA) of 1969. Therefore, the preparation of an Environmental Impact Statement (EIS) is not required and BPA is issuing this FONSI.

21111 (INIS-BR–3538) **Caxingo - a promising model for integrating the hydroelectric work camps to the site communities.** Luna, A.M. Companhia Hidroeletrica do Sao Francisco (CHESF), Recife, PE (Brazil)); Falcao, A.A. Companhia Paranaense de Energia (COPEL), Curitiba, PR (Brazil). 1989. 5p. (In Portuguese). (CONF-8910591–: 10. national seminar on production and transmission of electric power, Curitiba (Brazil), 1-5 Oct 1989). Order Number DE95632376. Source: OSTI; NTIS (US Sales Only); INIS.

The social and economical impacts caused by the hydroelectric work camps in the sites where the hydroelectric will be constructed are studied, analysing the great supply of works when the hydroelectric is been constructed face to the reduction one when the works are concluded; the neglect by the State in providing medical and educational assistances to the neighbour populations; the appearance of a commerce in the neighbour areas; the employer stableness in the camp after the pension and the lack by the neighbour cities of a social and economical substructure to offer to the population, that come with the hydroelectric construction. A new solution for these problems is presented in the Xingo camp, where the camp will be as a district of city near to the work, with community services provide by the State and the needful substructure to its construction and the equipment provide by the concessionaire. 21112 (NEI-DK–2068) **The utilization of water courses for the production of electric power. Report from a working group.** Skov- og Naturstyrelsen, Hoersholm (Denmark). 1992. 49p. (In Danish). Order Number DE95787833. Source: OSTI; NTIS; INIS.

The problems connected with damming Danish water courses to enable the production of hydroelectricity are discussed. These constraints are generally related to conservation principles and cultural historical interests. It is observed that attempts are usually made to remove dams constructed in water courses such as streams and brooks, in order to ensure the free passage of fish and small animals and it is the opinion of the working group that this policy should continue to be followed. Otherwise alternative methods (such as fish staircases and fish sluices) should be set up to enable the fish to pass through without getting entangled with any turbines. Consideration must be given to the preservation of items of cultural-historical interest. Where waters are stagnant, at least half of the water volume should be left untouched for fish passage, and in other non-stagnant water areas water should be reserved for fish passage. The amount of necessary water volume should be assessed in individual cases. The local authorities have agreed that legislation on dams, the establishment of fauna and fish passages and the dedication of free waters to fish passage should be coordinated. (AB)

21113 (BNL–61769) **Waste reduction options for manufacturers of copper indium diselenide photovoltaic cells.** DePhillips, M.P.; Fthenakis, V.M.; Moskowitz, P.D. Brookhaven National Lab., Upton, NY (United States). Mar 1994. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95012517. Source: OSTI; NTIS; GPO Dep.

This paper identifies general waste reduction concepts and specific waste reduction options to be used in the production of copper indium diselenide (CIS) photovoltaic cells. A general discussion of manufacturing processes used for the production of photovoltaic cells is followed by a description of the US Environmental Protection Agency (EPA) guidelines for waste reduction (i.e., waste minimization through pollution prevention). A more specific discussion of manufacturing CIS cells is accompanied by detailed suggestions regarding waste minimization options for both inputs and outputs for ten stages of this process. Waste reduction from inputs focuses on source reduction and process changes, and reduction from outputs focuses on material reuse and recycling.

21114 (NREL/TP–413-7991) **Fabrication of stable, large-area thin-film CdTe photovoltaic modules. Final subcontract report, May 10, 1991–February 28, 1995.** Zhou, T.X. (Solar Cells, Inc., Toledo, OH (United States)). National Renewable Energy Lab., Golden, CO (United States); Solar Cells, Inc., Toledo, OH (United States). Jun 1995. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95009222. Source: OSTI; NTIS; GPO Dep.

During the period of this subcontract, May 1991 through February 1995, Solar Cells, Inc. has developed and demonstrated a low-cost process to fabricate stable large-area cadmium telluride based thin-film photovoltaic modules. This report summarizes the final phase of the project which is concentrated on process optimization and product life tests. One of the major post-deposition process steps, the $CdCl_2$ heat treatment, has been experimentally replaced with alternative treatments with vapor chloride or chlorine gas. Material and device qualities associated with alternative treatments are comparable or superior to those with the conventional treatment. Extensive experiments have been conducted to optimize the back-electrode structure in order to ensure long term device stability. Numerous small-area cells and minimodules have been subjected to a variety of stress tests, including but not limited to continuous light soak under open or short circuit or with resistive load, for over 10,000 hours. Satisfactory stability has been demonstrated on 48 cm^2 and 64 cm^2 minimodules under accelerated tests and on 7200 cm^2 large modules under normal operating conditions. The conversion efficiency has also been significantly improved during this period. The total area efficiency of 7200 cm^2 module has reached 8.4%, corresponding to a 60.3W normalized output; the efficiency of 64 cm^2 minimodules and 1.1 cm^2 cells has reached 10.5% (aperture area) and 12.4% (total area), respectively.

21115 (NREL/TP–413-8008) **Novel two-stage selenization methods for fabrication of thin-film CIS cells and submodules. Final subcontract report, March 1, 1993–March 31, 1995.** Basol, B. (International Solar Electric Technology, Inglewood, CA (United States)); Kapur, V.; Halani, A.; Leidholm, C.; Minnick, A. National Renewable Energy Lab., Golden, CO (United States); International Solar Electric Technology, Inglewood, CA (United States). Jun 1995. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95009229. Source: OSTI; NTIS; GPO Dep.

This is the Phase 11 Final Technical Report of the subcontract titled "Novel Two-Stage Selenization Methods for Fabrication of Thin Film CIS Cells and Submodules." The general objectives of the program are the development of a cost-effective, large-area process for CIS film deposition, optimization of the various layers forming the CIS device structure, and fabrication of high efficiency submodules using these optimized device components. During this research period, growth parameters of ZnO window layers were varied to optimize their electrical and optical properties. Investigation of the chemical interactions between the glass substrates, Mo layers and the selenization atmosphere revealed that the nature of the glass/Mo substrate greatly influenced the quality of the solar cells fabricated on them. Moderate amounts of sodium diffusing from the soda-lime glass substrate into the CIS film improved the efficiencies of the solar cells fabricated on such films. Mo layers allowing excessive Na diffusion through them, on the other hand, reacted excessively with the H^2Se environment and deteriorated the solar cell performance. Addition of Ga into the CIS layers by the two-stage selenization technique yielded graded absorber structures with higher Ga content near the Mo/absorber interface. Cu-rich CIS layers were grown with grain sizes of larger than 5 μm. In the Phase I Annual Report large area CIS submodules with efficiencies of about 3% were reported. During the present Phase II program 1 ft^2 size CIS submodule efficiency was improved to 7%. Smaller area submodules with efficiencies as high as 9.79% were also fabricated using CIS layers obtained by the H_2Se selenization method. The processing yield of the devices based on a non-vacuum CIS deposition approach was improved and solar cells with efficiencies greater than 10% were fabricated.

21116 (NREL/TP–451-8017) **Processing and modeling issues for thin-film solar cell devices. Annual subcontract report, January 16, 1994–January 15, 1995.** Birkmire, R.W. (Delaware Univ., Newark, DE (United States). Inst. of Energy Conversion); Phillips, J.E.; Buchanan, W.A.; Hegedus, S.S.; McCandless, B.E.; Shafarman, W.N. This report describes results achieved during the second phase of a four year subcontract to develop and understand thin film solar cell technology related to a-Si and its alloys, $CuIn_{1-x}Ga_xSe_2$, and CdTe. Accomplishments during this phase include, development of equations and reaction rates for the formation of $CuIn_{1-x}Ga_xSe_2$ films by selenization, fabrication of a 15% efficient $CuIn_{1-x}Ga_xSe_2$ cell, development of a reproducible, reliable Cu-diffused contact to CdTe, investigation of the role of CdTe-CdS interdiffusion on device operation, investigation of the substitution of HCl for $CdCl_2$ in the post-deposition heat treatment of CdTe/CdS, demonstration of an improved reactor design for deposition of a-Si films, demonstration of improved process control in the fabrication of a ten set series of runs producing ~8% efficient a-Si devices, demonstration of the utility of a simplified optical model for determining quantity and effect of current generation in each layer of a triple stacked a-Si cell, presentation of analytical and modeling procedures adapted to devices produced with each material system, presentation of baseline parameters for devices produced with each material system, and various investigations of the roles played by other layers in thin film devices including the Mo underlayer, CdS and ZnO in $CuIn_{1-x}Ga_xSe_2$ devices, the CdS in CdTe devices, and the ZnO as window layer and as part of the back surface reflector in a-Si devices. In addition, collaborations with over ten research groups are briefly described. 73 refs., 54 figs., 34 tabs.

21117 (DOE/GO–10095-072) **Public utilities supply solar energy to eager customers.** National Renewable Energy Lab., Golden, CO (United States). Jan 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95000289. Source: OSTI; NTIS; GPO Dep.

This articles examines how photovoltaic power is an alternative source of energy that can help utilities earn goodwill from their customers for being innovative, saving money, and reducing harmful emissions. Planners at municipal utilities are discovering the advantages that photovoltaic (PV) power offers. In addition to the thousands of private, federal, state, and commercial PV systems installed during the last 20 years, more than 65 cities in 24 states also have installed such systems. PV power is cost effective in selected utility applications today, and those applications are expanding every year. PV can be useful in applications ranging from

low-power uses to decentralized applications to large, central stations. Public utilities in Austin and Sacramento are among those successfully using PV power for all three types of applications.

21118 (NEDO-P–9317) **Investigation on designing form of introduction of the photovoltaic power generation system for international cooperation.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1994. 139p. (In Japanese). Order Number DE95786814. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

An investigational study was carried out to effectively make a concrete design in case of introducing the photovoltaic power generation for international cooperation. To well-balancedly integrate it into energy plans of developing countries, it is presently necessary to conduct detailed investigation and design at each target point for introduction and to obtain various technical knowledges. In fiscal 1992, target points for introduction were selected, load patterns, specifications for component equipment, required areas and roughly estimated price are prepared and standardized so that appropriate introduction form can be selected based on meteorological data. A guide for basic design was also formed. In fiscal 1993, programming of this guide was studied, and the basic design was made easily possible using general-purpose computer. By inputting solar radiating conditions and load conditions, specifications for each equipment are automatically selected. Designers make simulational calculation through interaction with personal computer and check supply/demand balance. Further, data to be referred to in the simulation are arranged and filed. 49 figs., 27 tabs.

21119 (NREL/TP–411-8006) **Technical evaluation of a USSC Integrated/Direct Mount PV Roofing Module system at NREL.** Strand, T.; Hansen, R.; Mrig, L. National Renewable Energy Lab., Golden, CO (United States). May 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. (CONF-950585–2: 13. NREL photovoltaics program review meeting, Lakewood, CO (United States), 16-19 May 1995). Order Number DE95009217. Source: OSTI; NTIS; GPO Dep.

The results of a 16 month technical evaluation performed on a nominal 1 kW_{ac} utility-interconnect amorphous silicon PV system deployed at the National Renewable Energy Laboratory's PV outdoor test site are given here. The system employs 64 prototype United Solar Systems Corp. Integrated/Direct Mount PV Roofing Modules mounted on simulated attic/roof structures. In this paper we show that the PV array fill factor has been relatively stable with respect to time and that the seasonal variations in performance can be largely attributed to seasonal variations in current. We also show that in determining the summer and winter ac power output, the summation of the manufacturer-supplied module peak powers at STC for a similarly located and configured a-Si PV array should be derated by factors of approximately of 0.83 and 0.78 for summer and winter operation, respectively.

21120 (NREL/TP–472-7850) **Building-integrated photovoltaics (BIPV): Analysis and US market potential. Final report.** Frantzis, L. (Little (Arthur D.), Inc., Cambridge, MA (United States)); Friedman, D.; Hill, S.; Teagan, P.; Strong, S.; Strong, M. National Renewable Energy Lab., Golden, CO (United States); Little (Arthur D.), Inc., Cambridge, MA (United States); Solar Design Associates, Harvard, MA (United States). Feb 1995. 176p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95004055. Source: OSTI; NTIS; GPO Dep.

Arthur D. Little, Inc., in conjunction with Solar Design Associates, conducted a study for the US Department of Energy (DOE), Office of Building Technologies (OBT) to determine the market potential for grid-connected, building-integrated photovoltaics (BIPV). This study defines BIPV as two types of applications: (1) where the PV modules are an integral part of the building, often serving as the exterior weathering skin; and (2) the PV modules are mounted on the existing building exterior. Both of these systems are fully integrated with the energy usage of the building and have potential for significant market penetration in the US. Off-grid building applications also offer a near-term market for BIPV, but are not included in the scope of this study.

21121 (SAND–95-0904C) **National electrical code changes for 1996 and USA participation in International Energy Agency activities related to photovoltaics safety and grid interconnection.** Bower, W. Sandia National Labs., Albuquerque, NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950725–2: SOLAR '95: national solar energy conference: 10,000 solutions - paths to a renewable future, Minneapolis, MN (United States), 15-20 Jul 1995). Order Number DE95011892. Source: OSTI; NTIS; GPO Dep.

As photovoltaic (PV) systems gain more acceptance in utility-interactive applications throughout the world, many organizations are placing increasingly higher priorities on writing guidelines, codes and standards. These guidelines and codes are being written to improve safety, installation, acceptance, listing or certification of the PV components or systems. Sandia National Laboratories' PV System Applications Department is working closely with the PV industry to address issues that are associated with fire and personnel safety and with National Electrical Code (NEC) requirements. Additionally, the United States has agreed to participate in two of the International Energy Agency (IEA) Annexes (topical tasks) of the Implementing Agreement for a Cooperative Programme on Photovoltaic Power Systems. This paper describes events and activities associated with the NEC and the IEA that are being led by Sandia National Laboratories with broad participation by the US PV industry.

21122 (SAND–95-1082C) **Technical status of the Dish/Stirling Joint Venture Program.** Bean, J.R. (Cummins Power Generation, Inc., Columbus, IN (United States)); Diver, R.B. Sandia National Labs., Albuquerque, NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950729–6: 30. Intersociety energy conversion conference, Orlando, FL (United States), 30 Jul - 5 aug 1995). Order Number DE95013021. Source: OSTI; NTIS; GPO Dep.

Initiated in 1991; the Dish/Stirling Joint Venture Program (DSJVP) is a 5-year, $17.2 million joint venture which is funded by Cummins Power Generation, Inc. (CPG) of Columbus, Indiana and the United States Department of Energy's (DOE) Solar Thermal and Biomass Power Division. Sandia National Laboratories administers and provides technical management for this contract on the DOE's behalf. In January, 1995; CPG advanced to Phase 3 of this three-phase contract. The objective of the DSJVP is to develop and commercialize a 7-kW. Dish/Stirling System for remote power markets by 1997. In this paper, the technical status of the major subsystems which comprise the CPG 7-kW_e Dish/Stirling System is presented. These subsystems include the solar concentrator, heat pipe receiver, engine/alternator, power conditioning, and automatic controls.

21123 (CONF-950336–25) **Experimental evaluation of a simulation model for wrap-around heat exchanger, solar storage tanks.** Miller, J.A.; Hittle, D.C. Colorado State Univ., Fort Collins, CO (United States). Solar Energy Applications Lab. [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG36-86SF16306. From American Society of Mechanical Engineers/Japanese Society of Mechanical Engineers/Japan Solar Energy Society international solar energy conference; Lahaina, HI (United States); 19-24 Mar 1995. Order Number DE95011598. Source: OSTI; NTIS; GPO Dep.

The thermal performance of a commercially available 80 gallon, solar storage tank with an integral wrap-around heat exchanger is characterized experimentally an indoor test stand. The experimental results are used to evaluated the accuracy of a previously developed simulation model. Heat input on the collector side of the heat exchanger is held constant causing the heat transfer to reach

a quasi-steady state. Temperatures in the heat exchanger and tank increase with time, however, the temperature differences across the heat exchanger remain nearly constant. Several combinations of heat input and collector loop flow are investigated. The development of the tank temperature profiles over time and the overall heat transfer performance predicted by the model are compared with experimental results. The influence of an electric auxiliary heater located in the top of the solar storage tank on the heat exchanger performance is investigated. Experimental normalization of the model is considered and modifications to the model and experiments are recommended.

21124 (DTU-LV-MEDD–275) **Solar heating system based on the drain-back principle.** Boye-Hansen, L.; Furbo, S. Danmarks Tekniske Univ., Lyngby (Denmark). Lab. for Varmeisolering. Mar 1995. 70p. (In Danish). Contract ENS-51181-93.0019. Order Number DE95787736. Source: OSTI; NTIS.

The use of the drain back principle makes it possible to design cheaper, more reliable solar heating systems with increased thermal performances. Nevertheless almost no drain back systems have so far been built in Denmark. In this project a number of small laboratory investigations concerning different details of the design of drain back systems have been carried out. It was investigated for which conditions there is a freezing risk in the pipe connecting the heat storage with the solar collector on cold mornings when water is pumped from the storage to the collector. It was also investigated how to design the system to avoid water to be sucked up in the solar collector during cold nights. It was further investigated which tilt is needed for the pipes in the solar collector loop to ensure a complete draining of the solar collector. Furthermore, it was investigated if evaporation from the water surface in the solar collector loop during cold nights can result in condensation, ice formation and frost burst in the cold parts of the solar collector loop. In a cooperation with solar collector producers three small test DHW solar heating systems were built. The three systems are drain-back systems making use of water as the solar collector fluid. The systems have different designs. Measurements of the thermal performances of the systems have been carried out. Based on the investigations it is possible to estimate the reliability and thermal performance of the systems. A 52 m^2 drain back solar heating system was built in a building in the spring of 1994. The net utilized solar energy of the system was measured and the measurements were compared with calculated quantities. (au) 15 refs.

21125 (NEI-DK–2022) **Analysis of building-integrated solar heating for Globorama. Final report.** Cowiconsult Raadgivende Ingenioerer A/S, Lyngby (Denmark). May 1995. 37p. (In Danish). Contract ENS-51181-94.0055. Order Number DE95787773. Source: OSTI; NTIS.

Globorama is a permanent exhibition building planned to be built in Herning. It should constitute a tourist attraction the aim of which is to promote awareness of global and local environmental problems and to suggest what the individual can do to help mitigate them. The institution will include activities related to energy and the environment and interactive exhibits will demonstrate the dynamic interplay between nature, human beings and technology. The building itself will be constructed in harmony with the concept of environmental protection, and will integrate solar heating. This model building is described in detail, both architecturally and with relation to energy conservation, ventilation, building materials, heat recovery, temperature regulation, environmental protection and especially the design of the solar heating facilities. (AB)

21126 (NEI-DK–2066) **Development of a multi-function expansion tank.** Dansk Teknologisk Inst., Taastrup (Denmark). Proevestationen for Solenergi; Ringsted Energi Center, Ringsted (Denmark). Jun 1995. 54p. (In Danish). Contract ENS-51181-93.0017. Order Number DE95787836. Source: OSTI; NTIS.

The aim was to develop and test an expansion tank for a solar heating system. The tank should have a number of built-in functions including a safety valve allowing the escape of air and steam, a counter-valve in the form of a liquid lock connected to the solar collector, an automatic deflation of air bubbles from the solar collector, a visual system for checking the level of liquid and the circulation through transparent tubes and the collection of liquid when boiling occurs in the solar collector. This system is less expensive and makes adjustments easier to carry out. The system includes pumps, control equipment and all other necessary equipment with the exception of the solar collector, some tubes and the storage tank. It is suitable for do-it-yourself experts. The system should be on the market by September 1995. (AB)

21127 (DTU-LV–95-7) **Efficiencies of solar collectors for different tilts. Measurements.** Furbo, S.; Holck, O. Danmarks Tekniske Univ., Lyngby (Denmark). Lab. for Varmeisolering. May 1995. 7p. Order Number DE95779208. Source: OSTI; NTIS.

The measured heat loss coefficients of solar collectors and by that the efficiencies of the collectors are influenced by the collector tilt. The efficiency is especially influenced by the tilt during operation periods with large (T_m - T_{amb})/G-ratios. The influence of the tilt on the efficiency is different from one collector to another. (au)

21128 (KTH-IT-M–36) **Solar collector model for testing and simulation.** Isakson, P. Royal Inst. of Tech., Stockholm (Sweden). Div. for Building Services Engineering. May 1995. 190p. Project BFR-900280-1. Order Number DE95779292. Source: OSTI; NTIS.

An outdoor test of a collector module requires measurements during a few clear days, which in practice may take weeks to accomplish. Furthermore, performance evaluations of solar heating plants in Sweden are typically expensive and take a couple of years to carry out. Thus, three dynamic flat plate collector software models have been developed by the author; 1. The MFC that models a single collector module, 2. The MFCA that models parallel rows of collectors connected with buried pipes, and 3. The FFC model - a set of frequency functions that extends the collector efficiency factor F' and the heat removal factor F_R to the dynamic case. The MFC model has been thoroughly validated. It faithfully reproduces daylong sequences of measured data, but for transients caused by stepwise changes in the input signals. However, we noted bias errors in our day to day cross-validations. We conclude that the weather varies from one day to another in a way that is neither accounted for in the particular models nor in the measurements. Nevertheless, the results suggest that an outdoor collector test procedure that requires measurements during no more than a few days with fair weather is possible. We proposed a performance test for large collector arrays based on the MFCA model parameterized with one free parameter. The test requires data from regular operation during no more than one month, thus avoiding the cost of specially designed experiments. The accuracy achieved in the long term predictions does not fully satisfy our requirements. Nevertheless, we find the result encouraging and we are confident that some improvements will make the test useful in practice. 60 refs

21129 (PNL–10416) **Final project report - CRADA with United Solar Technologies and Pacific Northwest Laboratory (PNL-021): Thin film materials for low-cost high performance solar concentrators.** Martin, P.M.; Affinito, J.D.; Gross, M.E.; Bennett, W.D. Pacific Northwest Lab., Richland, WA (United States). Mar 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95010423. Source: OSTI; NTIS; GPO Dep.

The objectives of this project were as follows: To develop and evaluate promising low-cost dielectric and polymer-protected thin-film reflective metal coatings to be applied to preformed continuously-curved solar reflector panels to enhance their solar reflectance, and to demonstrate protected solar reflective coatings on preformed solar concentrator panels. The opportunity for this project arose from a search by United Solar Technologies (UST) for organizations and facilities capable of applying reflective coatings to large preformed panels. PNL was identified as being uniquely qualified to participate in this collaborative project.

21130 (SAND–94-1832) **The lustering of TBC-2.** Diver, R.B.; Jones, S.; Robb, S.; Mahoney, A.R. Sandia National Labs., Albuquerque, NM (United States). May 1995. 30p. Sponsored by

USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95012113. Source: OSTI; NTIS; GPO Dep.

Two test bed concentrators (TBCs) were designed to provide high-performance test beds for advanced solar receivers and converters. However, the second-surface silvered-glass mirror facets on the TBCs, which were originally manufactured by the Jet Propulsion Laboratory, have experienced severe silver corrosion. To restore reflectance, TBC-2 was refurbished with a lustering technique developed at Sandia National Laboratories. In the lustering technique, second-surface silvered thin-glass mirrors were applied over the corroded facets, thereby increasing the dish reflectivity and raising the available power of TBC-2 from approximately 70 to 78 kW_t. Degradation of the original optical accuracy of the TBC facets was determined to be minimal. Lustering was chosen over facet replacement because of the lower cost, the anticipated improvement in corrosion resistance, and the shorter project duration. This report includes background information, details of the lustering process, and test results from TBC-2 characterization, both before and after lustering.

21131 (SAND–94-1884) **Test results: SEGS LS-2 solar collector.** Dudley, V.E. (EG&G Special Projects, Albuquerque, NM (United States)); Kolb, G.J.; Mahoney, A.R.; Mancini, T.R.; Matthews, C.W.; Sloan, M.; Kearney, D. Sandia National Labs., Albuquerque, NM (United States). Dec 1994. 139p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95010682. Source: OSTI; NTIS; GPO Dep.

A SEGS LS-2 parabolic trough solar collector was tested to determine the collector efficiency and thermal losses with two types of receiver selective coatings, combined with three different receiver configurations: glass envelope with either vacuum or air in the receiver annulus, and glass envelope removed from the receiver. As expected, collector performance was significantly affected by each variation in receiver configuration. Performance decreased when the cermet selective coating was changed to a black chrome coating, and progressively degraded as air was introduced into the vacuum annulus, and again when the glass envelope was removed from the receiver. For each receiver configuration, performance equations were derived relating collector efficiency and thermal losses to the operating temperature. For the bare receiver (no glass envelope) efficiency and thermal losses are shown as a function of wind speed. An incident angle modifier equation was also developed for each receiver case. Finally, equations were derived showing collector performance as a function of input insolation value, incident angle, and operating temperature. Results from the experiments were compared with predictions from a one-dimensional analytical model of the solar receiver. Differences between the model and experiment were generally within the band of experimental uncertainty.

21132 (SAND–94-2059C) **Development of a 75-kW heat-pipe receiver for solar heat-engines.** Adkins, D.R.; Andraka, C.E.; Moss, T.A. Sandia National Labs., Albuquerque, NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9505155–2: 9. international heat pipe conference, Albuquerque, NM (United States), 1-5 May 1995). Order Number DE95011604. Source: OSTI; NTIS; GPO Dep.

A program is now underway to develop commercial power conversion systems that use parabolic dish mirrors in conjunction with Stirling engines to convert solar energy to electric power. In early prototypes, the solar concentrator focused light directly on the heater tubes of the Stirling engine. Liquid-metal heat-pipes are now being developed to transfer energy from the focus of the solar concentrator to the heater tubes of the engine. The dome-shaped heat-pipe receivers are approximately one-half meters in diameter and up to 77-kW of concentrated solar energy is delivered to the absorber surface. Over the past several years, Sandia National Laboratories, through the sponsorship of the Department of Energy, has conducted a major program to explore receiver designs and identify suitable wick materials. A high-flux bench-scale system has been developed to test candidate wick designs, and full-scale systems have been tested on an 11-meter test-bed solar concentrator. Procedures have also been developed in this program to measure the properties of wick materials, and an extensive data-base on wick materials for high temperature heat pipes has been developed. This paper provides an overview of the receiver development program and results from some of the many heat-pipe tests.

May 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-950514–13: World geothermal congress: worldwide utilization of geothermal energy, Florence (Italy), 18-31 May 1995). Order Number DE95012382. Source: OSTI; NTIS; GPO Dep.

The performance of TOUGH2, Lawrence Berkeley Laboratory's general purpose simulator for mass and heat flow and transport enhanced with the addition of a set of preconditioned conjugate gradient solvers, was tested on three PCs (486-33, 486-66, Pentium-90), a MacIntosh Quadra 800, and a workstation IBM RISC 6000. A two-phase, single porosity, 3-D geothermal reservoir model with 1,411 irregular grid blocks, with production from and injection into the reservoir was used as the test model. The code modifications to TOUGH2 and its setup in each machine environment are described. Computational work per time step and CPU time requirements are reported for each of the machines used. It is concluded that the current PCs provide the best price/performance platform for running large-scale geothermal field simulations that just a few years ago could only be executed on mainframe computers and high-end workstations.

1501 Resources and Availability

21134 (NEDO-P–9325) **Fundamental investigation for widening utilization of hot dry rock resource.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1994. 321p. (In Japanese). Order Number DE95786806. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

For the purpose of making wide use of hot dry rock resource, investigation was conducted into grasp of its resource amount and potential utilization. The amount of hot dry rock resource (unit: 10^{15}kcal) in 29 areas investigated this time was as follows: as to shallow-area resource; it was 200 and 145 in the depth up to 3 km and at temperatures over 200°C and over 250°C, respectively, and as to deep-area resource in the depth of 3-5 km, it was 491. Among the areas, 7 areas were regarded as promising. Models proposed by Greengarten and others are improved to calculate potential power generation amount. In case it is in the shallow area and more than 30,000 kW in size, hot dry rock energy is possibly competitive with other energy. In case it is 3,000 kW in size, it is low in economy as energy for power generation and necessary to be regarded as local energy which should be multi-purposely used. If it is in the deep area, hot dry rock energy is low in economy in case of about 10,000 kW in size, but possibly competitive with other energy in case of large scale development of more than 100,000 kW in size. Also studied was a possibility of expanding use of hot dry rock energy except power generation. 63 refs., 160 figs., 53 tabs.

1502 Geology and Hydrology of Geothermal Systems

21135 (USGS-OFR–94-553) **Volcanic activity and ground deformation hazard analysis for the Hawaii Geothermal Project Environmental Impact Statement.** Kauahikaua, J. (Geological Survey, Hawaii National Park, HI (United States). Hawaiian Volcano

Observatory); Moore, R.B.; Delaney, P. Minerals Management Service, Menlo Park, CA (United States); Geological Survey, Hawaii National Park, HI (United States). Hawaiian Volcano Observatory; Geological Survey, Denver, CO (United States); Geological Survey, Flagstaff, AZ (United States). [1994]. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI05-93OR22089. Order Number DE95013084. Source: OSTI; NTIS; GPO Dep.

The Hawaii Geothermal Project involves the development of a geothermal resource for electrical power production within three geothermal subzones on the east rift zone of Kilauea volcano. The Project includes overland transmission of this power to the west coast of Hawai'i and via submarine cable to O'ahu. In this report, lava flow and ground deformation hazard are evaluated for the three geothermal subzones and for the three proposed overland transmission routes. The time interval for evaluating hazards was chosen as 50 years because that is consistent with seismic design standards in the Uniform Building Code, and because of limited information on occurrence dates.

1503 Geothermal Exploration and Exploration Technology

21136 (ETDE/JP-mf–95786807) **Report on verification survey on fiscal 1993 geothermal exploration technology. Development of fracture type reservoir exploring method/ development of electromagnetic wave utilization probing method (development of Array CSMT method).** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1994. 144p. (In Japanese). Order Number DE95786807. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

The paper reports the results of development of an array type CSMT method conducted in fiscal 1993. As for the array CSMT method probing system, such improvements are made as addition of a function of the MT method for receiving natural signal to the receiver, and employment of multi-core cable, etc. As to software, the MT method data and the array CSMT method data are connected, and the program is improved so that the data can be processed without near field effects. Further, the following were carried out: take-in of resistivity logging data, improvement of noise resistance, response to discontinued frequency data. The experiment on application of this system was conducted in the Sumikawa area in Akita Pref. As a result, the following results were obtained despite of noise from construction work of the power plant: acquisition of good data, improvement of traverse line setting efficiency, quality improvement of high frequency band data using signal booster, etc. In the inversion analysis made jointly with MT method data, well reflected were fracture type structures and alteration zones. 48 figs., 8 tabs.

21137 (ETDE/JP-mf–95786815) **Geothermal development promotion survey in fiscal 1993 (Yamaaoizawa area No.C-2). Fiscal annual influence survey report on the environment.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1994. 207p. (In Japanese). Order Number DE95786815. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

As a survey in fiscal 1993 to promote the geothermal development, the first annual influence was surveyed on the environment in Yamaaoizawa Area No. C-2. The present survey was conducted to grasp the influence of geothermal exploration drilling on the environment, and simultaneously, present status of necessary environmental elements before starting the survey and development. Located in a mountainous district, about 14km southeast of the center of Okachi Town, Akita Prefecture, the surveyed area covers Takamatsu Region, Yuzawa City, and a part of Akinomiya Region, Okachi Town. Having an area of about 8km^2, it is a hardly flat land lying at the altitude of about 500 to 1200m. Kawarage Spa which is naturally fumarolic is located in its northeast, while both Doroyu and Niiyu Spas are done in its east. With the exception of Kigiyama Spa and swimming pool use hot spring well, fluctuation is observed in hot water temperature and discharging rate in Takamatsu Spa, both Ogura and Okuyama Hotels of Doroyu Spa, Arayu Spa, Yunotai-Shingoro Spa, and Well T-501 through before, during and after the exploratory drilling. However, this fluctuation is judged to be not attributable to the exploratory drilling, but to the change in mateorological and seasonal conditions. 47 figs., 26 tabs.

21138 (ETDE/JP-mf–95786816) **Geothermal development promotion survey report in fiscal 1992. 37. Influence survey on the environment in Hongu Area.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1994. 45p. (In Japanese). Order Number DE95786816. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

The area around Hongu Town, Wakayama Prefecture was surveyed to know the influence of exploratory drilling and other geothermal development works on the hot spring and other environments. The influence of exploratory drilling and HG-2 well hot water collection test was surveyed at six Na-HCO3/Cl type hot springs, of which the hot water temperature, discharging rate and pH were 66.5 to 91.5°C, 17 to 402l/min and 7.2 to 7.9, respectively. Their evaporation residue can be classified by weight per liter into two groups, i.e., 1100 to 1200mg/l and 810 to 970mg/l. No particularly large difference was made in chemical composition between the pre-fumarolic survey and second annual survey. With the exception of discharging rate, all the other survey items hardly fluctuated with a smaller fluctuation coefficient than 10%. No remarkable change was observed through before, during and after the exploratory drilling, which therefore suggested that the hot spring was stable during the fluctuation survey, continuously conducted since the beginning of pre-fumarolic survey. The hot spring did not remarkably change during the hot water collection as well as through before, during and after the well drilling. 5 figs., 5 tabs.

21139 (DOE/OR/22088–T1) **Surveys of forest bird populations found in the vicinity of proposed geothermal project subzones in the district of Puna, Hawaii.** Jacobi, J.D.; Reynolds, M.; Ritchotte, G.; Nielsen, B.; Viggiano, A.; Dwyer, J. Fish and Wildlife Service, Hawaii National Park, HI (United States). Hawaii Research Station. Oct 1994. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI05-93OR22088. Order Number DE95013081. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents data on the distribution and status of forest bird species found within the vicinity of proposed geothermal resource development on the Island of Hawaii. Potential impacts of the proposed development on the native bird populations found in the project are are addressed.

21140 (DOE/OR/22088–T2) **Vegetation component of geothermal EIS studies: Introduced plants, ecosystem stability, and geothermal development.** Fish and Wildlife Service, Hawaii National Park, HI (United States). Hawaii Research Station. Oct 1994. 93p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI05-93OR22088. Order Number DE95013080. Source: OSTI; NTIS; INIS; GPO Dep.

This paper contributes new information about the impacts from introduced plant invasions on the native Hawaiian vegetation as consequences of land disturbance and geothermal development activities. In this regard, most geothermal development is expected to act as another recurring source of physical disturbance which favors the spread and maintenance of introduced organisms throughout the region. Where geothermal exploration and development activities extend beyond existing agricultural and residential development, they will become the initial or sole source of disturbance to the naturalized vegetation of the area. Kilauea has a unique ecosystem adapted to the dynamics of a volcanically active landscape. The characteristics of this ecosystem need to be realized in order to understand the major threats to the ecosystem and to evaluate the effects of and mitigation for geothermal development in Puna. The native Puna vegetation is well adapted to disturbances associated with volcanic eruption, but it is ill-adapted

to compete with alien plant species in secondary disturbances produced by human activities. Introduced plant and animal species have become a major threat to the continued presence of the native biota in the Puna region of reference.

21141 (ETDE/JP-mf–95786813) **Survey of fiscal 1993 geothermal development promotion. 38. Western area of Mt. Aso (Report on the third year environmental effect survey).** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Jan 1995. 45p. (In Japanese). Order Number DE95786813. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

In the western area of Mt. Aso, a survey was conducted of effects of drilling of exploration wells on the environment for geothermal development. Following fiscal 1991, the survey was carried out in terms of ingredient and variations of the five spas in the area. The results of the survey are as follow: No. 1 spa is large in variations of amount of discharge water, anion, and electric conductivity, but there are no correlations among items of survey. No. 2 spa is large in variations of amount of discharge, but stable in the other items. No. 3 showed large variations in every item, and indicated positive correlation between temperature of the spa and amount of discharge and negative correlation between PH and EC. No. 4 spa showed small variations in every item and stable in amount of discharge. No. 5 spa is stable in temperature of the spa and PH, but after much rainfall the discharge rapidly increased, and ion and EC decreased. It is thought that these are caused by large influence of difference in the climate situation such as precipitation of every fiscal year. No variations are seen which are thought to be brought about by drilling of the exploration well. 3 refs., 6 figs., 10 tabs.

21142 (LBL–36849) **Numerical simulation of water injection into vapor-dominated reservoirs.** Pruess, K. Lawrence Berkeley Lab., CA (United States). Jan 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-950514–12: World geothermal congress: worldwide utilization of geothermal energy, Florence (Italy), 18-31 May 1995). Order Number DE95012390. Source: OSTI; NTIS; GPO Dep.

Water injection into vapor-dominated reservoirs is a means of condensate disposal, as well as a reservoir management tool for enhancing energy recovery and reservoir life. We review different approaches to modeling the complex fluid and heat flow processes during injection into vapor-dominated systems. Vapor pressure lowering, grid orientation effects, and physical dispersion of injection plumes from reservoir heterogeneity are important considerations for a realistic modeling of injection effects. An example of detailed three-dimensional modeling of injection experiments at The Geysers is given.

21143 (NEI-DK–2067) **Description and evaluation of foreign wind turbine technology.** Petersen (H.) Consult, Broenshoej (Denmark); Darup Associates ApS (Denmark). Jun 1995. 87p. (In Danish). Contract ENS-51171-93.0045. Order Number DE95787835. Source: OSTI; NTIS; INIS.

It is stated that sales of Danish-manufactured wind turbines abroad are decreasing due to an increase in production, marketing and technology research in other countries. The aim was to give an account of this international development which could form the basis for the future strategies of the Danish Wind turbine industry. The study is based on a survey of relevant literature, interviews with experts on the subject and the collection of the latest data. The survey is limited to wind turbines with a larger capacity than 50 kW. Recommendations are given as to how to conserve and develop the market for Danish wind turbines. (AB) 17 refs.

1705 Environmental Aspects

21144 (DOE/EIS–0206) **Proposed Columbia Wind Farm #1. Joint NEPA/SEPA draft environmental impact statement.** US-DOE Bonneville Power Administration, Portland, OR (United States). Mar 1995. 255p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012240. Source: OSTI; NTIS; INIS; GPO Dep.

This Draft Environmental Impact Statement (DEIS) addresses the Columbia Wind Farm #1 (Project) proposal for construction and operation of a 25 megawatt (MW) wind power project in the Columbia Hills area southeast of Goldendale in Klickitat County, Washington. The Project would be constructed on private land by Conservation and Renewable Energy System (CARES) (the Applicant). An Environmental Impact Statement is required under both NEPA and SEPA guidelines and is issued under Section 102 (2) (C) of the National Environmental Policy Act (NEPA) at 42 U.S.C. 4321 et seq and under the Washington State Environmental Policy Act (SEPA) as provided by RCW 43.21C.030 (2) (c). Bonneville Power Administration is the NEPA lead agency; Klickitat County is the nominal SEPA lead agency and CARES is the SEPA co-lead agency for this DEIS. The Project site is approximately 395 hectares (975 acres) in size. The Proposed Action would include approximately 91 model AWT-26 wind turbines. Under the No Action Alternative, the Project would not be constructed and existing grazing and agricultural activities on the site would continue.

21145 (NEI-DK–2065) **Does noise from wind turbines change due to age? Noise generated by gears at Kyndby wind turbine array.** Astrup, T. Oedegaard og Danneskiold-Samsoee ApS, Copenhagen (Denmark). Mar 1995. 17p. (In Danish). Contract ENS-1363/94-0008. Order Number DE95787839. Source: OSTI; NTIS; INIS.

EFP-94.

Continuous measurements were taken of noise emission from the gears of two wind turbines at Kyndby wind turbine array in Denmark during the period 1989-94 in order to determine whether the character of the noise altered with time. The gears were renovated during 1992. In the case of wind turbine 11 the dominating gear noise changed from 400 Hz to 416 Hz and noise emission from the gears of wind turbine 13 changed from 400 Hz to 350 Hz. After the renovation the noise from turbine 11 and turbine 13 respectively was reduced by 13 dB and 11 dB. The gear-noise is determined as A-weighted sound effect level of sound with a reference wind velocity of 8 m/a. During 1990-94 the gear-noise from turbine 11 increased by 6 dB while it decreased by a further 3 dB in the case of turbine 13. It is concluded that in the case of one turbine the noise emission constantly increased after renovation in contrast to the other where noise pollution decreased after renovation. Meshing at 416 Hz is close to the torsional resonances in the gearbox. These results could indicate that the frequency of meshing close to torsional resonances should be avoided when designing gearboxes. (AB)

EFP-93.

This report describes a series of field measurements of sound propagating from a loudspeaker 22 m above ground. The measurement results are used as a basis for a method to predict noise from wind turbines. The outline of the method seems rather clear even if a number of details still have to be worked out. We combined the field data with theory and found that downwind ground effect can be accurately described by theory for straight-line propagation (no wind) provided we increase the source height in the calculations. We propose this as a method for predicting downwind noise levels from wind turbines and we believe the results can be generalized to be valid outside the range of distances, heights and terrain roughness represented in our present data. We also believe the theoretical calculations in 1/3 octave bands could be approximated by accurate yet simple octave band calculations but time did not permit us to do so within the project. Crosswind data showed more spread than downwind data. This is natural, since crosswind in practice sometimes is slightly upwind and sometimes slightly downwind. The data showed a fair agreement with straight-line predictions and we propose to predict crosswind ground effect based on theory for 'no wind' without modifying the source height. Also data from upwind propagation measurements showed considerable spread. At low frequencies we propose ground effect to be predicted based on theory for straight-line propagation but with reduced source height. At high frequencies upwind noise attenuation seems to be determined by 'shadow-zone' formation. We did not find an accurate way to predict noise levels in the shadow zone but we do not consider this a serious drawback for practical prediction work. To be useful in practical prediction a set of simple formulas for octave band calculations should be developed based on the theory. (au) 15 refs.

21148 (RISO-R–773(EN)) **Experimental determination of stiffness distributions and mode shapes of wind turbines blades.** Larsen, G.C.; Kretz, A. Risoe National Lab., Roskilde (Denmark). Test Station for Wind Turbines. Mar 1995. 59p. Contract ENS-5332/93-0001. Order Number DE95779206. Source: OSTI; NTIS; Also available from Risoe Library, P.O. Box 49, DK-4000 Roskilde, Denmark.

Two non-destructive experimental methods, related to the structural properties of wind turbine blades, have been formulated and applied to two different blades. The first method deals with determination of the flexural rigidities of wind turbine blades and is based on static deflection measurements. The procedure has been applied to determine distribution of flapwise- and edgewise flexural rigidities of the LM17 m and the LM19 m blade. The findings have been compared to results obtained from cross section calculations, and the overall agreement between measured and calculated flexural rigidities is good, except for the edgewise rigidities related to the LM19 m blade, where some deviations are observed. The reason for this disagreement is believed to be a poor resolution of the curvature in the root part of the blade due to a seemingly hinge like edgewise deformation mechanism here. The second method deals with the determination of blade mode shapes. The method is founded on an experimental determination of the transfer function relating a dynamic loading with the corresponding acceleration response in a suitable number of points along the structure. The method has successfully been used to determine the first flapwise and edgewise natural modes of the LM17 m blade, and natural modes of the Lm19 m blade related of the first flapwise-, the second flapwise-, and the first edgewise natural frequency. (au) (13 tabs., 28 ills., 4 refs.)

21149 (RISO-R–799(EN)) **A design study of a 1 MW stall regulated rotor.** Fuglsang, P.L.; Madsen, H.Aa. Risoe National Lab., Roskilde (Denmark). Test Station for Wind Turbines. May 1995. 108p. Contract ENS-1363/95-0001; Contract ENS-1363/94-0001; Contract E Order Number DE95787780. Source: OSTI; NTIS; Also available from Risoe Library, P.O. Box 49, DK-4000 Roskilde, Denmark.

EFP-95; EFP-94; EFP-91.

The main objective of the present work has been to design a 1 MW stall regulated rotor and investigate the potential improvements by using special tailored airfoils. The target rotor should have an improved cost performance compared to existing rotors. Cost performance is the annual production of energy seen relative to the material consumption. A newly developed numerical optimization tool and an aeroelastic code have been used in the study. Design parameters have been the blade chord, twist, tip pitch angle, angular velocity and airfoil characteristics. The objective function for the optimization has been the annual production of energy in the Danish roughness class 1. Constraints have been put on mean and extreme blade root flapwise moments, rated power, tip speed and blade geometry. By performing aeroelastic calculations on the optimized designs with different levels of constraints on the mean blade root flapwise moments, an almost linear correlation between the mean blade root flapwise moment and the equivalent fatigue loads appears. The optimum ratio of rated power to swept area appears to be around 400 W/m^2 having the mean flapwise blade root moment constrained to 80%. The maximum annual production of energy has been obtained for the airfoil section maximum lift coefficient, C_{Lmax}, being high over the entire blade independent on constrained loads. The direct improvement from the use of special tailored airfoils has been found to be around 4% on the annual energy production and 1.5% on the material consumption. When the entire rotor geometry is included as optimization variables, the choice of C_{Lmax} becomes less important since the design space is flat in the neighbourhood of the optimum. The results indicate a potential improvement of the cost performance of about 11% of which 5.5% can be achieved with the use of traditional airfoils. (Abstract Truncated)

21150 (SAND–94-2604C) **All wind farm uncertainty is not the same: The economics of common versus independent causes.** Veers, P.S. Sandia National Labs., Albuquerque, NM (United States). [1994]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950309–7: 25. annual conference and exhibition on wind power, Washington, DC (United States), 26-30 Mar 1995). Order Number DE95011894. Source: OSTI; NTIS; INIS; GPO Dep.

There is uncertainty in the performance of wind energy installations due to unknowns in the local wind environment, machine response to the environment, and the durability of materials. Some of the unknowns are inherently independent from machine to machine while other uncertainties are common to the entire fleet equally. The FAROW computer software for fatigue and reliability of wind turbines is used to calculate the probability of component failure due to a combination of all sources of uncertainty. Although the total probability of component failure due to all effects is sometimes interpreted as the percentage of components likely to fail, this perception is often far from correct. Different amounts of common versus independent uncertainty are reflected in economic risk due to either high probabilities that a small percentage of the fleet will experience problems or low probabilities that the entire fleet will have problems. The average, or expected cost is the same as would be calculated by combining all sources of uncertainty, but

the risk to the fleet may be quite different in nature. Present values of replacement costs are compared for two examples reflecting different stages in the design and development process. Results emphasize that an engineering effort to test and evaluate the design assumptions is necessary to advance a design from the high uncertainty of the conceptual stages to the lower uncertainty of a well engineered and tested machine.

1707 Health and Safety

21151 (NREL/SP–441-7814) **Proceedings of National Avian-Wind Power Planning Meeting, Lakewood, Colorado, July 20-21, 1994.** National Renewable Energy Lab., Golden, CO (United States). Apr 1995. 146p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. (CONF-9407179–: National Avian-wind power planning meeting, Lakewood, CA (United States), 20-21 Jul 1994). Order Number DE95004090. Source: OSTI; NTIS; GPO Dep.

In recent years, bird deaths in wind power plants within the United States have become an important issue with economic, legal, policy and research dimensions. The National Avian-Wind Power Planning Meeting was convened to focus on the research aspects, particularly to (1) identify and prioritize key issues with respect to bird-wind turbine interactions, (2) define a research agenda to resolve scientific and technical issues, while (3) insuring transferability of results, (4) avoiding duplication and inadequate science, and (5) building consensus on approaches to the research needed to address the issues. About 57 individuals plus various independent scientists with relevant expertise, met in Lakewood, Colorado, on 20-21 July 1994. They reviewed the status of wind power in the USA; developed lists of research questions; reviewed past and ongoing avian research at wind plants in the USA and Europe; discussed general design concepts for avian-wind power research, including both monitoring methods and the Adaptive Resource Management approach; discussed desirable components of an integrated national research program; and identified next steps that should be taken. The meeting Proceedings volume includes a Meeting Summary section covering each of the above topics, plus a more detailed description of the presentations, discussions and conclusions on each topic. Meeting attendees recommended that some of the technical issues identified at this meeting be taken up by a group with broader representation and mandate, including the economic, policy and legal ramifications. The National Wind Coordinating Committee's Avian Subcommittee may be an appropriate group to carry forward the work begun at this meeting. The overall goal might be to devise a process, incorporating scientific research as a major element, that would allow the wind industry to develop without the occurrence of an unacceptable number of bird deaths.

21154 (DOE/MC/21023–3946) **Second Generation Pressurized Fluidized-Bed Combustion (PFBC). Phase 1, Task 4: Circulating PFB combustor, Test results.** Conn, R.; Robertson, A.; Van Hook, J.; Newby, R. Foster Wheeler Development Corp., Livingston, NJ (United States). Oct 1994. 620p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-86MC21023. Order Number DE95000039. Source: OSTI; NTIS; GPO Dep.

This pilot plant program confirmed the viability of the CPFBC (circulating pressurized fluidized-bed combustion) design and barrier candle filter from both operational and gaseous emissions standpoints. Several high volatile bituminous and one subbituminous coal were evaluated in addition to chars produced in the carbonizer pilot plant tests during Phase 2. Effects of combustor temperature, primary air stoichiometry, and excess air on combustor performance were evaluated. Carbon combustion efficiency were very high, exceeding 99% for all test coals and chars. CO emissions were very low compared to atmospheric CFB experience, <0.02 lb/10^6 Btu; it decreased by half when combustor temperature was increased from 1600 to 1700 F. Sulfur capture efficiencies >96% were achieved with sorbent addition rates of Ca/S ratios between 1.1 and 2.0. Because of the short height of the CPFBC, NO_x emissions were high but about half the NSPS requirements; primary air stoichiometry had the strongest effect. Also because of the short CPFBC height, Ca sulfide conversions were 74–82% for the char blends; higher sulfide conversions would be expected in a commerical-scale plant. Alkali concentrations were several times higher than the gas turbine limit, hence, an alkali getter will be required in a commercial plant. The barrier candle filter (14 Schumacher clay-bonded SiC candles) showed excellent performance for an extended test over 100 h with both coal and char firing.

21155 (DOE/MC/27363–3966) **Tampa Electric Company, Polk Power Station Unit No. 1, preliminary public design report.** Tampa Electric Co., FL (United States). Jun 1994. 146p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-91MC27363. Order Number DE95000051. Source: OSTI; NTIS; GPO Dep.

This preliminary Public Design Report (PDR) provides design information about Tampa Electric Company's Polk Power Station Unit No. 1, which will demonstrate in a commercial 250 MW unit the benefits of the integration of oxygen-blown, entrained-flow coal gasification with advanced combined cycle technology. This project is partially funded by the US Department of Energy (DOE) under Round III of its Clean Coal Technology (CCT) Program under the provisions of Cooperative Agreement between DOE and Tampa Electric Company, novated on March 5,1992. The project is highlighted by the inclusion of a new hot gas cleanup system. DOE's project management is based at its Morgantown Energy Technology Center (METC) in West Virginia. This report is preliminary, and the information contained herein is subject to revision. Definitive information will be available in the final PDR, which will be published at the completion of detailed engineering.

21156 (DOE/MC/28065–4014) **Molten carbonate fuel cell (MCFC) product development test. Annual report, September 1993–September 1994.** M-C Power Corp., Burr Ridge, IL (United States). Feb 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-92MC28065. Order Number DE95000084. Source: OSTI; NTIS; GPO Dep.

M-C Power Corporation will design, fabricate, install, test and evaluate a 250 kW Proof-of-Concept Molten Carbonate Fuel Cell (MCFC) Power Plant. The plant is to be located at the Naval Air Station Miramar in San Diego, California. This report summarizes the technical progress that has occurred in conjunction with this

project in 1994. M-C Power has completed the tape casting and sintering of cathodes and is proceeding with the tape casting and sintering of anodes for the first 250 cell stack. M-C Power and San Diego Gas and Electric relocated the fuel cell demonstration project to an alternate site at the Naval Air Station Miramar. For the new project location at the Naval Air Station Miramar, an Environmental Assessment has been prepared by the Department of Energy in compliance with the National Environmental Policy Act of 1969. The Environmental Assessment resulted in a categorical exclusion of the proposed action from all environmental permit requirements. Bechtel Corporation has completed the reformer process design coordination, a Process Description, the Pipe and Instrumentation Diagrams, a Design Criteria Document and General Project Requirement Document. Bechtel developed the requirements for soils investigation report and issued the following equipment bid packages to the suppliers for bids: Inverter, Reformer, Desulfurization Vessels, Hot Gas Recycle Blower, Heat Recovery Steam Generator, and Recycle Gas Cooler. SDG and E has secured necessary site permits, conducted soils investigations, and is working on the construction plan. They are in final negotiations with the US Navy on a site agreement. Site drawings are required for finalization of the agreement.

21157 (DOE/MC/30246–4022) **Advanced turbine systems program conceptual design and product development. Quarterly report, August–October, 1994.** Solar Turbines, Inc., San Diego, CA (United States). Jan 1995. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC30246. Order Number DE95000092. Source: OSTI; NTIS; GPO Dep.

The objective of Phase 2 of the Advanced Turbine Systems (ATS) Program is to provide the conceptual design and product development plan for an ultra-high efficiency, environmentally superior and cost competitive industrial gas turbine system to be commercialized by the year 2000. A secondary objective is to begin early development of technologies critical to the success of ATS. During this report period, the following tasks were completed: Market study; System definition and analysis; and Integrated program plans. Progress on Task 8, Design and Test of Critical Components, is also discussed. This particular task includes expanded materials and component research covering recuperators, combustion, autothermal fuel reformation, ceramics application and advanced gas turbine system controls.

21158 (ETDE-DE–131) **Hydrogen/oxygen sudden reserve facility for fast power increase of steam power plants with integrated H_2O_2 steam generator, HYDROSS. Final report phase C. Vol. 1.** Fichtner Development Engineering GmbH, Stuttgart (Germany). 15 Nov 1994. 260p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 0326544B. Order Number DE95785864. Source: OSTI; NTIS (US Sales Only).

Loose-leaf edition.

In the electricity supply grid of Western Europe, the supraregional utilities have agreed to provide a so-called primary reserve, which serves to maintain a rated frequency of 50 Hz. Imbalances between the generated and consumed electricity will cause frequency variations as electricity grids in general have low storage capacities. In the Western European interconnected grid, variations up to 150 mHz may occur. There are great differences in the annual incidence of negative variations from the rated frequency of 50 Hz. For example, there were about 4000 hours of variations with frequencies of less than 50 mHz but only about 260 hours of higher variations. Fast unit control possibilities - so-called sudden reserves - are required to remedy these negative deviations within a few seconds. The project intended to prove that the H_2O_2 steam generator combined with an efficient control concept can meet the demands on primary reserve and also the specifications of the DVG including high availability and reliability of starting. (orig.)

21159 (ETDE-DE–132) **Hydrogen/oxygen sudden reserve facility for fast power increase of steam power plants with integrated H_2O_2 steam generator, HYDROSS. Final report phase C. Vol. 2.** Fichtner Development Engineering GmbH, Stuttgart (Germany). 22 Nov 1994. 299p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 0326544B. Order Number DE95785863. Source: OSTI; NTIS (US Sales Only).

21161 (ANL/ES/CP–84453) **Development of mercury control techniques for utility boilers.** Livengood, C.D.; Mendelsohn, M.H.; Huang, H.S.; Wu, J.M. Argonne National Lab., IL (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950646–22: Air and Waste Management Association meeting, San Antonio, TX (United States), 18-23 Jun 1995). Order Number DE95013517. Source: OSTI; NTIS; GPO Dep.

This paper gives an overview of research being conducted at Argonne National Laboratory on the capture of mercury in flue gas by both dry sorbents and wet scrubbers. The emphasis in the research is on development of a better understanding of the key factors that control the capture of mercury. Future work is expected to utilize that information for the development of new or modified process concepts featuring enhanced mercury capture capabilities.

21162 (CONF-9410328–1) **Ocean disposal of CO_2 at intermediate depths.** Adams, E.E.; Golomb, D.S.; Herzog, H.J. Massachusetts Inst. of Tech., Cambridge, MA (United States). Energy Lab. [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-94PC94227. From Workshop on CO_2 ocean disposal; Tokyo (Japan); 28 Oct 1994. Order Number DE95010507. Source: OSTI; NTIS; GPO Dep.

One option to reduce atmospheric CO_2 levels is to capture and sequester power plant CO_2. Commercial CO_2 capture technology, though expensive, exists today. However, the ability to dispose of large quantities of CO_2 is highly uncertain. The deep ocean is one of only a few possible CO_2 disposal options and is a prime candidate because the deep ocean is vast and highly unsaturated in CO_2. The term disposal is really a misnomer because the atmosphere and ocean eventually equilibrate on a timescale of 1,000 years regardless of where the CO_2 is originally discharged. However, peak atmospheric CO_2 concentrations expected to occur in the next few centuries could be significantly reduced by ocean disposal. From ocean scale mathematical models which compare the impact of releasing fossil-fuel CO_2 into the ocean at various depths, the authors conclude that a sequestration depth of about 1,000 m is required to achieve desired residence times on the order of hundreds of years. Below they summarize several modes of

CO_2 injection which have been identified in the literature. They conclude that the most feasible initial options will involve a release of liquid CO_2 at intermediate depths of 1,000 to 1,500 m. Either an unconfined release leading to a buoyant droplet plume or a confined release leading to a dense CO_2-seawater solution would work. The intermediate discharge depth represents a compromise between the depth of ultimate sequestration, current engineering technology and national jurisdiction limits. They outline steps toward implementation of these options, including needed studies on injector design, transport and costs, site selection and environmental and legal considerations.

21163 (DOE/MC/22118–3969) **Field study for disposal of solid wastes from Advanced Coal Processes: Ohio LIMB Site Assessment. Final report, April 1986–November 1994.** Weinberg, A.; Coel, B.J.; Butler, R.D. Radian Corp., Austin, TX (United States). Oct 1994. 671p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-86MC22118. Order Number DE95000053. Source: OSTI; NTIS; GPO Dep.

New air pollution regulations will require cleaner, more efficient processes for converting coal to electricity, producing solid byproducts or wastes that differ from conventional pulverized-coal combustion ash. Large scale landfill test cells containing byproducts were built at 3 sites and are to be monitored over at least 3 years. This report presents results of a 3-y field test at an ash disposal site in northern Ohio; the field test used ash from a combined lime injection-multistage burner (LIMB) retrofit at the Ohio Edison Edgewater plant. The landfill test cells used LIMB ash wetted only to control dusting in one cell, and LIMB ash wetted to optimize compaction density in the other cell. Both test cells had adequate load-bearing strength for landfill stability but had continuing dimensional instability. Heaving and expansion did not affect the landfill stability but probably contributed to greater permeability to infiltrating water. Leachate migration occurred from the base, but effects on downgradient groundwater were limited to increased chloride concentration in one well. Compressive strength of landfilled ash was adequate to support equipment, although permeability was higher and strength was lower than anticipated. Average moisture content has increased to about 90% (dry weight basis). Significant water infiltration has occurred; the model suggests that as much as 20% of the incident rainfall will pass through and exit as leachate. However, impacts on shallow ground water is minimal. Results of this field study suggest that LIMB ash from combustion of moderate to high sulfur coals will perform acceptably if engineering controls are used to condition and compact the materials, reduce water influx to the landfill, and minimize leachate production. Handling of the ash did not pose serious problems during cell construction; steaming and heat buildup were moderate.

21164 (DOE/PC/90366–T13) **Characterization of air toxics from a laboratory coal-fired combustor and utility scale power plants. Quarterly progress report No. 14, January–March, 1995.** Battelle, Columbus, OH (United States). May 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC90366. Order Number DE95011920. Source: OSTI; NTIS; GPO Dep.

This report summarized progress on Task 3, Power Plant Studies, and Task 4, Technical Management and Reporting. Task 3 this quarter involved sampling of flue gas from Units 6 and 7 of the host power plant. The operating parameters during the sampling period are given. Laboratory analyses are in progress. Under Task 4, internal and external QA/QC audits were conducted. A data base management system was prepared. An appendix contains a data compilation of plant operating data.

21165 (DOE/PC/90367–T13) **Sampling of power plant stacks for air toxic emissions: Topical report for Phases 1 and 2.** Radian Corp., Austin, TX (United States). 21 Feb 1995. 341p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC90367. (DCN–95-209-057-05). Order Number DE95011466. Source: OSTI; NTIS; GPO Dep.

Under contract with the US Department of Energy (DE-AC22-92PCO0367), Pittsburgh Energy Technology Center, Radian Corporation has conducted a test program to collect and analyze size-fractionated stack gas particulate samples for selected inorganic hazardous air pollutants (HAPS). Specific goals of the program are (1) the collection of one-gram quantities of size-fractionated stack gas particulate matter for bulk (total) and surface chemical charactization, and (2) the determination of the relationship between particle size, bulk and surface (leachable) composition, and unit load. The information obtained from this program identifies the effects of unit load, particle size, and wet FGD system operation on the relative toxicological effects of exposure to particulate emissions.

21166 (DOE/PC/93254–T1) **Characterizing toxic emissions from a coal-fired power plant demonstrating the AFGD ICCT Project and a plant utilizing a dry scrubber/baghouse system: Bailly Station Units 7 and 8 and AFGD ICCT Project. Final report. Final report.** Dismukes, E.B. Southern Research Inst., Birmingham, AL (United States). 20 Oct 1994. 889p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-93PC93254. (SRI-ENV–94-287-7960). Order Number DE95005662. Source: OSTI; NTIS; GPO Dep.

This report describes results of assessment of the risk of emissions of hazardous air pollutants at one of the electric power stations, Bailly Station, which is also the site of a Clean Coal Technology project demonstrating the Pure Air Advanced Flue Gas Desulfurization process (wet limestone). This station represents the configuration of no NO_x reduction, particulate control with electrostatic precipitators, and SO_2 control with a wet scrubber. The test was conducted September 3–6, 1993. Sixteen trace metals were determined along with 5 major metals. Other inorganic substances and organic compounds were also determined.

21167 (NEI-DK–1988) **Optimized construction and use of flue-gas heat exchangers in the large natural gas-fueled boilers.** Energiministeriets Forskningsudvalg for produktion og fordeling af el og varme. Miljoe og restprodukter. Krueger (I.) A/S, Copenhagen (Denmark); Dansk Teknologisk Inst., Taastrup (Denmark). Apr 1995. 111p. (In Danish). Contract EM-1433/86-14. Order Number DE95779161. Source: OSTI; NTIS.

EFP-86.

The Danish Technological Institute and I. Krueger AS have cooperated in developing computer programmes, COHEX and MODS, to compute condensing flue gas coolers. The computer programmes focus on the computation of crossflow/counterflow heat exchangers, but are able to handle other configurations - especially COHEX. The computer program computes performance and temperature data, amount of condensate and pressure loss in connection with complete or partial condensing flue gas cooling. Through laboratory tests it has been demonstrated that the measured values are in agreement with the computed values within an average uncertainty margin of +/- 10% with regard to the determination of heat transfer coefficient. For practical use this result is considered as satisfactory. (au) (30 refs.)

2004 Health and Safety

21168 (BNL–61542) **Issues in the assessment of congenital health risks from mercury in coal.** Lipfert, F.W. (Brookhaven National Lab., Upton, NY (United States)); Moskowitz, P.D.; Saroff, L. Brookhaven National Lab., Upton, NY (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950646–12: Air and Waste Management Association meeting, San Antonio, TX (United States), 18-23 Jun 1995). Order Number DE95009043. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes a probabilistic assessment of congenital neurological risks associated with consumption of fish and shellfish containing MeHg and the effects that local coal combustion might have on those risks. Two scenarios were considered with this model: the "baseline" scenario (MeHg from fish consumption without local impacts), and the "impact" scenario (baseline plus local power-plant impact on freshwater fish). In this paper, we describe the framework and application of the model, including parameters and statistical linkages, the distributions used to represent the parameters, and the statistical methods used to characterize the inherent variability in each individual's diet and the distribution of

individuals within a hypothetical population. These factors define the baseline, which is then compared to observations of MeHg in hair in order to demonstrate the model's validity. The incremental effect of local coal combustion is represented by augmenting the distribution of Hg in local freshwater fish by a prescribed amount, which we refer to as the "impact factor." Conventional air pollution dispersion modeling is then used to relate this factor to an appropriate range of powerplant characteristics.

2005 Environmental Aspects

Refer also to citation(s) 21168

21169 (DOE/EIS–0215-Vol.1) **Final environmental impact statement for the proposed Pinon Pine Power Project, Tracy Station, Nevada. Volume 1.** USDOE, Washington, DC (United States). Sep 1994. 448p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012137. Source: OSTI; NTIS; INIS; GPO Dep.

Pinon Pine, a proposed 104 MW (gross) demonstration project at Sierra Pacific's Tracy Power Station 17 miles east of Reno NV, would demonstrate Integrated Gasification Combined Cycle for converting coal into clean gas, burning the gas in a combustion turbine to generate electric power, and capturing the heat to drive a steam turbine for additional power. It would use the KRW fluidized-bed gasification process and would also demonstrate the effectiveness of hot gas cleanup. Environmental impacts from Pinon Pine construction are evaluated in this FEIS: detailed analyses are made on air quality, water quality and quantity, the endangered Cui-ui fish species, disposal of spent limestone and coal ash, noise, land use, aesthetics, cultural resources, socioeconomic resources, etc. Mitigation measures are discussed.

21170 (DOE/EIS–0215-Vol.2) **Final Environmental Impact Statement for the proposed Pinon Pine Power Project, Tracy Station, Nevada: Volume 2, Appendices.** USDOE Morgantown Energy Technology Center, WV (United States). Sep 1994. 420p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012138. Source: OSTI; NTIS; INIS; GPO Dep.

Appendices are included which cover the assessment methodology, agency coordination letters, the visibility impact analysis, water consumption, groundwater quality, reading rooms, comments submitted on the Draft Environmental Impact Statement, and responses to comments.

21 NUCLEAR POWER REACTORS AND ASSOCIATED PLANTS

Refer also to citation(s) 21152, 21211

21171 (CEA-CONF–11971) **Civil plutonium amounts in the world.** Naudet, G. CEA, 75 - Paris (France). 1994. 10p. (In French). (CONF-9406338–: Colloquium on plutonium: a new nuclear fuel, Paris (France), 9 Jun 1994). Order Number DE95631360. Source: OSTI; NTIS (US Sales Only); INIS.

The experience of plutonium reprocessing in water reactors is positive and today the use of this nuclear fuel is at industrial level. Plutonium quantities in spent fuel go on increasing, plutonium stock coming from reprocessing can be controlled: according to conjuncture, it will evolve by stabilization or decreasing at the beginning of next century.

21172 (EPRI–95011538) **Electric Power Research Institute: To discover, to develop, to deliver. 1992 Annual report.** Electric Power Research Inst., Palo Alto, CA (United States). [1993]. 40p. Sponsored by Electric Power Research Inst., Palo Alto, CA (United States). Source: OSTI; EPRI Distribution Center, 207 Coggins Drive, PO Box 23205, Pleasant Hill, CA 94523 (United States); INIS.

This report highlights the winners of the 1992 3-D Awards and surveys other Institute accomplishments in discovery, development, and delivery for the year – achievements that exemplify EPRI's ability to fulfill the promise of its mission.

21173 (FAAR–23/1993, pp. 284-289) **PVC smoke and CsI aerosol mixture in moist atmosphere. An experimental study.** Surakka, J. (Kuopio Univ. (Finland). Dept. of Environmental Sciences. Lab. for Atmospheric Physics and Chemistry). Finnish Association for Aerosol Research, Espoo (Finland); Technical Research Centre of Finland, Espoo (Finland). Aerosol Technology Group. 1993. (CONF-9306401–: 5. Finnish national aerosol symposium, Espoo (Finland), 1-3 Jun 1993). In *The fifth Finnish national aerosol symposium.* 292p. Order Number DE95632436. Source: OSTI; NTIS; INIS.

Report series in aerosol science.

The mixture of hygroscopic CsI aerosol simulating nuclear aerosol and smoke from PVC cable fire were studied in a small scale reactor chamber. The atmosphere in the chamber represents the post-accident situations in nuclear reactor or reactor containment area. Changes with time in mixture aerosols were measured by optical particle counter (OPC). The aim of these experiments was to study experimentally the effect of PVC cable smoke and hygroscopic CsI aerosol mixture to humidity level in the reactor chamber. (12 refs., 4 figs.).

21174 (IAEA-TECDOC–797) **OSART mission highlights 1991-1992. Operational safety practices in nuclear power plants.** International Atomic Energy Agency, Vienna (Austria). May 1995. 83p. Order Number DE95633550. Source: OSTI; NTIS (US Sales Only); INIS.

This report continues the practice of providing summaries of the OSART missions but the format is the first of its kind. Summaries of missions in the period 1983-1990 have covered missions to operational plants, missions to plants under construction or approaching commissioning and a compilation of good practices identified in OSART missions as separate publications. The format of this report includes all such aspects in one document.

Aerosol Technology Group. 1993. (CONF-9306401–: 5. Finnish national aerosol symposium, Espoo (Finland), 1-3 Jun 1993). In *The fifth Finnish national aerosol symposium.* 292p. Order Number DE95632436. Source: OSTI; NTIS; INIS.

Report series in aerosol science.

In the framework of the HDR program on nuclear reactor safety, several containment fire experiments were performed over the last years in realistic multi-compartment geometries with realistic fire loads originating from burning cables. The major objective was to evaluate and to assess the predictive quality of present computational tools for fire calculations. In the present paper, numerical simulations of two oil fire tests and one cable fire experiment are presented, with special emphasis regarding aerosol transport. The fire aerosols (smoke) have to be taken into account when considering the availability of rescue pathways for the operating personnel and the capacity of filters in the ventilation system. In case of severe accidents, interactions of smoke with radioactive aerosols may be of importance. (5 refs., 10 figs.).

21176 (FAAR–23/1993, pp. 256-266) **KAEVER: experiments on an improved understanding of aerosol behaviour in reactor containments.** Scheibel, H.G. (Battelle Ingenieurtechnik GmbH, Frankfurt am Main (Germany)); Poss, G.; Weber, D. Finnish Association for Aerosol Research, Espoo (Finland); Technical Research Centre of Finland, Espoo (Finland). Espoo (Finland), 1-3 Jun 1993). In *The fifth Finnish national aerosol symposium.* 292p. Order Number DE95632436. Source: OSTI; NTIS; INIS.

Report series in aerosol science.

KAEVER is an experimental program to investigate the influences of size distribution, morphology, composition and solubility on the aerosol behaviour under various thermohydraulic conditions simulating the accident situation in LWR-containments. The KAEVER facility consists of a 10 m^3 containment vessel, an aerosol generation system with two independent inductive furnaces and a sophisticated aerosol instrumentation. The research program includes experiments to the generation of single and multicomponent insoluble (SnO_2, Ag) and soluble (CsOH, CsI, NaCl) core melt aerosol simulants and investigates the aerosol agglomeration and deposition behaviour in the containment vessel under various thermohydraulic conditions. The experiments are supported by thermohydraulic and aerosol codes. The applied aerosol measurement equipment i.e. an aerosol photometer, a differential mobility analyzer, low pressure impactors, an optical particle counter, an aerodynamic particle sizer and filtration and deposition devices, provides data on particle size distribution, shape, concentration, and on the elemental composition. Particle size ranges from 0.01 μm up to 50 μm. (orig.) (6 refs., 1 fig., 1 tab.).

Report series in aerosol science.

At Winfrith the Falcon facility has been used to study fission product vapour release and aerosol formation from simulant and trace irradiated fuel and control rod samples, however these releases could not be observed in real time. Vapour release and aerosol formation from heated LWR fuel and control rod simulants have been studied as a function of time in the modified Falcon facility using a range of on-line aerosol sampling equipment. Various post test analytical techniques have been used to characterise the resulting chemical species and the particle physical characteristics. A companion paper describes the aerosol formation and release rates from the simulants, whilst the results of the chemical and physical analyses are described. (2 refs.).

21178 (FAAR–23/1993, pp. 269-273) **Experimental studies on aerosol behaviour in LWR containment conditions.** Maekynen, J.M. (Technical Research Centre of Finland, Espoo (Finland). Nuclear Engineering Lab.); Jokiniemi, J.K.; Silde, A.; Kauppinen, E.I.; Kervinen, H. Finnish Association for Aerosol Research, Espoo (Finland); Technical Research Centre of Finland, Espoo (Finland). Order Number DE95632436. Source: OSTI; NTIS; INIS.

Report series in aerosol science.

AHMED (Aerosol and Heat Transfer Measurement Device) has been constructed to study thermal-hydraulic effects on aerosol behaviour in nuclear power station containment during a hypothetical severe reactor accident where the reactor core melts and releases radioactive aerosols into containment. The objective of the work is to understand the reasons for observed large discrepancies between the results from model calculations and measurements carried out in large scale experiments (aerosol modelling, uncertainties in thermal-hydraulic conditions or measurements errors). (2 refs., 5 figs.).

21179 (JAERI-Research–95-013) **Behavior of pre-irradiated fuel under a simulated RIA condition. Results of NSRR test JM-4.** Fuketa, Toyoshi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Mori, Yukihide; Sasajima, Hideo; Tanzawa, Sadamitsu; Ishijima, Kiyomi; Kobayashi, Shinsho; Kikuchi, Teruo; Homma, Kozo; Sakai, Haruyuki. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 238p. Order Number DE95780630. Source: OSTI; NTIS; INIS.

This report presents results from the power burst experiment with pre-irradiated fuel rod, Test JM-4, conducted in the Nuclear Safety Research Reactor (NSRR). The data concerning test method, pre-irradiation, pre-pulse fuel examination, pulse irradiation, transient records and post-pulse fuel examination are described, and interpretations and discussions of the results are presented. Preceding to the pulse irradiation in the NSRR, test fuel rod was irradiated in the Japan Materials Testing Reactor (JMTR) up to a fuel burnup of 21.2 MWd/kgU with average linear heat rate of 27.5 kW/m. The fuel rod was subjected to the pulse irradiation resulting in a deposited energy of 235 $\pm$ 12 cal/g · fuel and a peak fuel enthalpy of 177 $\pm$ 9 cal/g · fuel under stagnant water cooling condition at atmospheric pressure and ambient temperature. Test fuel rod behavior was assessed from pre- and post-pulse fuel examinations and transient records during the pulse. The Test JM-4 became the first NSRR pre-irradiated fuel experiment resulting in fuel failure. The cladding surface temperature increased to 780degC, and the test resulted in fuel failure with considerable rod diameter increase and rod bending. The test results indicate that number of wall through defects are generated by intensive PCMI (pellet/cladding mechanical interaction) and local hydriding of cladding tube. Significant separation of grain boundaries was observed in extensive area of fuel pellets. (author).

21180 (NUREG–1433-Vol.3-Rev.1) **Standard Technical Specifications General Electric plants, BWR/4:Bases (Sections 3.4-3.10). Volume 3, Revision 1.** Nuclear Regulatory Commission, Washington, DC (United States). Div. of Project Support. Apr 1995. 415p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

This report documents the results of the combined effort of the NRC and the industry to produce improved Standard Technical Specifications (STS), Revision 1 for General Electric BWR/4 Plants. The changes reflected in Revision 1 resulted from the experience gained from license amendment applications to convert to these improved STS or to adopt partial improvements to existing technical specifications. This NUREG is the result of extensive public technical meetings and discussions between the Nuclear Regulatory Commission (NRC) staff and various nuclear power plant licensees, Nuclear Steam Supply System (NSSS) Owners Groups, NSSS vendors, and the Nuclear Energy Institute (NEI). The improved STS were developed based on the criteria in the Final Commission Policy Statement on Technical Specifications Improvements for Nuclear Power Reactors, dated July 22, 1993. The improved STS will be used as the basis for individual nuclear power plant licensees to develop improved plant-specific technical specifications. This report contains three volumes. Volume 1 contains the specifications for all chapters and sections of the improved STS. Volume 2 contains he Bases for Chapters 2.0 and 3.0, and Sections 3.1-3.3 of the improved STS. This document, Volume 3, contains the Bases for Sections 3.4-3.10 of the improved STS.

Source: OSTI; NTIS; INIS.

The overall objective of this program is to verify and improve engineering analyses to predict the fracture behavior of circumferentially cracked pipe under quasi-static loading. Particular attention is paid to crack lengths typically used in LBB or flaw evaluation criteria. This program started in march 1990 and is in its' final year. This paper reflects progress made in the 9 tasks since the last WRSIM meeting as well as our conclusions to date.

21183 (NUREG/CP–0139, pp. 57-58) **Methods for evaluating nontypical gate valve thrust requirements.** Steele, R. Jr. (Idaho National Engineering Lab., Idaho Falls, ID (United States)); Watkins, J.C.; DeWall, K.G.; Weidenhamer, G.H. Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research. Oct 1994. (CONF-9410216–: 22. water reactor safety information meeting, Bethesda, MD (United States), 24-26 Oct 1994). In *Transactions of the twenty-second water reactor safety information meeting.* 129p. Source: OSTI; NTIS; INIS.

Evaluating rising stem wedge type gate valves is not a problem when the valves can be design-basis tested and their operability margins determined diagnostically. The problem occurs when they cannot be tested because of system limitations or when they can be tested only at some less-than-design-basis condition. To evaluate these valves requires various analytical methods by which the design-basis stem thrust requirement can be determined. This is typically done with valve stem thrust force models that are used to calculate the requirements or to extrapolate the results from less than a design-basis test. The stem thrust models used by the nuclear industry to determine the opening or closing stem thrust requirements for these gate valves have generally assumed that the highest load the valve experiences during closure (but before seating) is at flow isolation and during unwedging or before flow initiation in the opening direction. However, during full-scale valve testing conducted for the USNRC, several of the valves produced stem thrust histories that showed peak closing stem forces occurring before flow isolation in the closing direction and after flow initiation in the opening direction. All of the valves that exhibited this behavior in the closing direction also showed signs of internal damage. Initially, we dismissed the early peak in the closing stem thrust requirement as damage-induced and labeled it nonpredictable behavior.

21184 (EDF–94-NB-00091) **"PSAD" on-line monitoring and aid to diagnosis workstation: a monitoring tool for EDF power plants.** Morel, J.; Mazalerat, J.M.; Monnier, B.; Cordier, R. Electricite de France (EDF), 92 - Clamart (France). 1993. 8p. (In French). Order Number DE95631405. Source: OSTI; NTIS (US Sales Only); INIS.

Like other electricity utilities, Electricite de France seeks to enhance the safety and availability of its nuclear power plants. To this end, for over ten years EDF has been installing on each plant unit two monitoring systems of its own design, one to monitor the primary cooling system, and the other, the turbogenerator set. Since the beginning of this project, widespread progress has been made in techniques of signal acquisition and processing, and in diagnosis using artificial intelligence methods. EDF has decided to call on these advanced techniques in developing its new-generation monitoring equipment, and to integrate them in its development of a workstation for on-line monitoring and diagnosis-support (PSAD: Poste de Surveillance et d'Aide au Diagnostic). PSAD will be a tool for on-line monitoring of the main components in nuclear power plants (initially the main coolant pumps and turbogenerator sets, and soon thereafter, monitoring of internal structures, detection of loose parts in the primary cooling system, etc.). PSAD will provide plant personnel with indispensable support in their diagnosis of the condition of plant equipment. It will integrate user-friendly, high-performance systems that also free the operator from many day-to-day tasks. PSAD will have a flexible architecture, for optimum distribution of the computing power where it is most needed, thereby improving the quality of the data. This paper presents the project objectives and describes work currently under way to implement EDF's diagnosis-support strategy for the years to come. (authors). 5 figs., 6 refs.

21185 (EDF–94-NB-00095) **Preliminary vibration analysis of the prestressed tie rods attaching the Paluel-4 main steam line No.1 stops to the concrete structures.** Guihot, P.; Chartain, G.; Coudiere, F. Electricite de France (EDF), 92 - Clamart (France). Nov 1993. 43p. (In French). Order Number DE95631407. Source: OSTI; NTIS (US Sales Only); INIS.

This report presents results of vibration analysis of prestressed tie rods attaching the main steam system stops on Paluel-4 line no 1. Reasons for this feasibility study and main results are summarized: During surface preparation for routine ultrasonic examination of the tie rods, a nut was found completely unscrewed. A systematic tightening procedure, using hydraulic devices, was immediately implemented. For about 1/3 of the 80 tie rods on the four live steam clamps, tension was below nominal. However, this checking procedure involves high costs. Until an explanation has been found, other plant units will have to be checked and it is consequently important to find a less costly way of checking the tension, so that the hydraulic tightening equipment would only be used in cases where prestressing was inadequate. The R and D Acoustics and Vibration Mechanics branch proposed to analyze the vibratory signature of the tie rods to assess sensitivity of their dynamic response to prestressing variations. Purpose of the tests was to estimate the feasibility of the procedure, which could then be refined. If we consider theoretical results, we find that the first bending frequency for a beam in tension depends on the tension level. Unfortunately, with the hammer tests performed, we were unable to identify the first eigenfrequency of the tie rod. Other parameters measured would not appear to be directly related to the prestress level. Since checking the prestress condition had to be extended to other units, it seems appropriate to pursue these investigations with a view to determining the exact sensitivity of the vibratory and acoustic parameters to the level of prestressing applied. It would also seem important to improve test conditions so that the first eigenfrequencies of the tie rods can be identified. A sinusoidal sweeping test with an electrodynamic exciter could be used for any future tests which may be carried out. (authors). figs., tabs., 2 refs., 4 annexes.

21186 (FAAR–23/1993, pp. 274-277) **Aerosol formation and release rates from heated LWR fuel and control rod simulants.** Maekynen, J.M. (Technical Research Centre of Finland, Espoo (Finland). Report series in aerosol science.

Vapour release rates and aerosol formation from heated LWR fuel and control rod simulants have been studied in the modified Falcon test facility. The simulant fuel samples consisted of UO_2 pellets in Zircaloy cladding. The pellets contained 8.84 mg of CsI, 56.94 mg of CsOH, 10.64 mg of Te, 21.66 mg of SrO, 34.42 mg of BaO and 55.80 mg of Mo in 18.6 g of UO_2. The composition of the control rod samples was 1.3 g 80 per cent Ag-15 per cent In-5% Cd in sections of 8.75 mm diameter stainless steel cladding. (2 refs., 2 figs.).

21187 (FURNAS-DEN-N–021/91) **Application of a new cross section library based on ENDF/B-IV to reactor core analysis.** Lima Bezerra, J. de. FURNAS Centrais Eletricas S.A., Rio de Janeiro, RJ (Brazil). Dept. de Engenharia Nuclear. Apr 1991. 61p. (In Portuguese). Order Number DE95632442. Source: OSTI; NTIS (US Sales Only); INIS.

The use of the ENDF/B-IV library in the LEOPARD code for the Angra-1 reactor simulation is presented. The results are compared to those obtained using the ENDF/B-II library and show better values for the power distribution but an underestimated global reactivity as compared to experimental results. (F.E.). 1 ref, 55 figs, 1 tab.

21188 (FURNAS-DEN-N–029/91(Rev.1)) **Methodology for reactor core physics analysis - part 2.** Ponzoni Filho, P.; Fernandes, V.B.; Lima Bezerra, J. de; Santos, T.I.C. FURNAS Centrais Eletricas S.A., Rio de Janeiro, RJ (Brazil). Dept. de Engenharia Nuclear. Dec 1992. 53p. (In Portuguese). Order Number DE95632443. Source: OSTI; NTIS (US Sales Only); INIS.

The computer codes used for reactor core physics analysis are described. The modifications introduced in the public codes and the technical basis for the codes developed by the FURNAS utility are justified. An evaluation of the impact of these modifications on the parameter involved in qualifying the methodology is included. (F.E.). 5 ref, 7 figs, 5 tabs.

21189 (NUREG–1275-Vol.11) **Operating experience feedback report – turbine-generator overspeed protection systems: Commercial power reactors. Volume 11.** Ornstein, H.L. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Safety Programs. Apr 1995. 115p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

This report presents the results of the US Nuclear Regulatory Commission's Office for Analysis and Evaluation of Operational Data (AEOD) review of operating experience of main turbine-generator overspeed and overspeed protection systems. It includes an indepth examination of the turbine overspeed event which occurred on November 9, 1991, at the Salem Unit 2 Nuclear Power Plant. It also provides information concerning actions taken by other utilities and the turbine manufacturers as a result of the Salem overspeed event. AEOD's study reviewed operating procedures and plant practices. It noted differences between turbine manufacturer designs and recommendations for operations, maintenance, and testing, and also identified significant variations in the manner that individual plants maintain and test their turbine overspeed protection systems. AEOD's study provides insight into the shortcomings in the design, operation, maintenance, testing, and human factors associated with turbine overspeed protection systems. Operating experience indicates that the frequency of turbine overspeed events is higher than previously thought and that the bases for demonstrating compliance with NRC's General Design Criterion (GDC) 4, Environmental and dynamic effects design bases, may be nonconservative with respect to the assumed frequency.

21190 (SAIC–94-6553) **Analysis of core damage frequency: Nuclear power plant Dukovany, VVER/440 V-213 Unit 1, internal events. Volume 1: Main report.** Pugila, W.J. Science Applications International Corp., San Diego, CA (United States). 21 Dec 1994. 13p. Sponsored by USDOE, Washington, DC (United States);International Atomic Energy Agency, Vienna (Austria);Government of the Czech Republic (Czech Republic). Order Number DE95012431. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the final results from the Level 1 probabilistic safety assessment (PSA) for the Dukovany VVER/440 V-213 nuclear power plant, Unit 1. Section 1.1 describes the objectives of this study. Section 1.2 discusses the approach that was used for completing the Dukovany PSA. Section 1.3 summarizes the results of the PSA. Section 1.4 provides a comparison of the results of the Dukovany PSA with the results of other PSAs for different types of reactors worldwide. Section 1.5 summarizes the conclusions of the Dukovany PSA.

21191 (DOE/EA–0984) **Environmental assessment for the deactivation of the N Reactor facilities.** USDOE Richland Operations Office, WA (United States). May 1995. 136p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012124. Source: OSTI; NTIS; INIS; GPO Dep.

This environmental assessment (EA) provides information for the US Department of Energy (DOE) to decide whether the Proposed Action for the N Reactor facilities warrants a Finding of No Significant Impact or requires the preparation of an environmental impact statement (EIS). The EA describes current conditions at the N Reactor facilities, the need to take action at the facilities, the elements of the Proposed Action and alternatives, and the potential environmental impacts. As required by the National Environmental Policy Act of 1969 (NEPA), this EA complies with Title 40, Code of Federal Regulations (CFR), parts 1500–1508, "Regulations for Implementing the Procedural Provisions of NEPA. " It also implements the "National Environmental Policy Act; Implementing Procedures and Guidelines" (10 CFR 1021).

21192 (FAAR–23/1993, pp. 278-283) **Uranium fuel particles in a rbmk accident. Particle characteristics and atmospheric transport.** Poellaenen, R. (Finnish Centre for Radiation and Nuclear Safety, Helsinki (Finland)); Toivonen, H.; Salonoja, M.; Valkama, I. Finnish Association for Aerosol Research, Espoo (Finland); Technical Research Centre of Finland, Espoo (Finland). Aerosol Technology Group. 1993. (CONF-9306401–: 5. Report series in aerosol science.

In a severe nuclear accident large amounts of radioactive substances, either gases or particles, may be released to the atmosphere. Small particles ($> 1\ \mu m$), formed from the gaseous species by nucleation and condensation, are often almost monoelemental in nuclide composition. Mechanically fragmented nuclear fuel particles are larger and their nuclide composition is similar to the fuel. However, gaseous species are missing. The volatile elements, e.g. I and Cs, are depleted, either partially or totally. Particle transport from the site of accident depends strongly on weather conditions and particle properties. The radioactive plume can rise rapidly several hundreds or even thousands of meters above the ground. Small particles can stay in the atmosphere long periods of time provided that they are initially transported to the upper parts of the atmosphere. Large particles leave the main aerosol stream mainly by sedimentation. Therefore, the behaviour and the radiological consequences of the large particles is not described properly by assuming that the 'particle plume' is similarly mixed than the gaseous plume. Particle specific trajectory calculations are needed. Consequence analyses of severe accidents are often performed neglecting the particle nature of the release. The properties of the particles, however, have an important role in the possible radiological hazard that the radioactive substances may cause. Especially beta radiation from large particles can lead to high individual skin doses. (7 refs., 2 figs., 2 tabs.).

21193 (PNL–10613) **RBMK thermohydraulic safety assessments using RELAP5/MOD3 codes.** Tsiklauri, G.V.; Schmitt, B.E. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95013853. Source: OSTI; NTIS; INIS; GPO Dep.

The capability of the RELAP5/MOD3 code to validate various transients encountered in RBMK reactor postulated accidents has been assessed. The assessment results include a loss of coolant accident at the inlet of the core pressure tube, the blockage of a pressure tube, and the pressure response of the core cavity to in core pressure tube ruptures. These assessments show that the RELAP5/MOD3 code can predict major phenomena during postulated accidents in the RBMK reactors.

21194 (ANL/RA/CP–83070) **Assessment of the SE2-ANL code using EBR-II temperature measurements.** Yang, W.S.; Yacout, A.M. Argonne National Lab., IL (United States). [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950904–2: 7. international meeting on nuclear reactor thermal hydraulics, Saratoga, NY (United States), 10-15 Sep 1995). Order Number DE95004640. Source: OSTI; NTIS; INIS; GPO Dep.

The SE2-ANL code is a modified version of the SUPERENERGY-2 code [1]. This code is used at Argonne National Laboratory (ANL) to compute the core-wide temperature profiles in Liquid Metal Reactor (LMR) cores. The accuracy of this code has recently been tested by comparing the predicted temperatures with measured values in the Experimental Breeder Reactor R (EBR-II). The detailed temperature distributions in two experimental subassemblies and the mixed mean subassembly outlet temperatures were used in this validation study. The SE2-ANL predictions were found to agree well with measured values. It was also found that SE2-ANL yields results with accuracy comparable to the more detailed COBRA-WC [2] calculations at much lower computational cost.

21195 (FEI–2383) **The influence of the water chemistry regime of the third circuit on the corrosion hydrogen burden to the secondary sodium circuit in the steam generator model of BN-800 reactor.** Smykov, V.B.; Ermolaev, N.P.; Kolesnik, A.I.; Egorov, V.A.; Shevchenko, N.N. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1994. 13p. (In Russian). Order Number DE95633613. Source: OSTI; NTIS (US Sales Only); INIS.

An experimental program was conducted to determine the influence of water chemistry on the corrosion hydrogen burden from the III circuit to the secondary sodium in sodium-heated rig of OTSG of NPP BN-800. Combined water chemistry has given the best passivative effect on steam-generating surfaces and smallest hydrogen burden to secondary sodium during start-up. Common hydrogen increasing in secondary sodium was less then 0.2 ppm. In case of AVT water chemistry (NH_3+N_2H_4) in III side of OTSG-rig the hydrogen level in secondary sodium was 1.0-1.2 ppm. It means that during first start-up at NPP BN-800 the common hydrogen level in secondary sodium may reaches 0.80-0.85 ppm. 4 figs.; 4 tabs.

21196 (IAEA-TECDOC–798) **Intercomparison of liquid metal fast reactor seismic analysis codes. V.1: Validation of seismic analysis codes using reactor core experiments. Proceedings of a research co-ordination meeting held in Vienna, 16-17 November 1993.** International Atomic Energy Agency, Vienna (Austria). May 1995. 181p. (CONF-9311319–: Research co-ordination meeting on intercomparison of liquid metal fast reactor seismic analysis codes, Vienna (Austria), 16-17 Nov 1993). Order Number DE95633614. Source: OSTI; NTIS (US Sales Only); INIS.

The Research Co-ordination Meeting held in Vienna, 16-17 November 1993, was attended by participants from France, India, Italy, Japan and the Russian Federation. The meeting was held to discuss and compare the results obtained by various organizations for the analysis of Italian tests on PEC mock-up. The background paper by A. Martelli, et al., Italy, entitled Fluid-Structure Interaction Experiments of PEC Core Mock-ups and Numerical Analysis Performed by ENEA presented details on the Italian PEC (Prova Elementi di Combustibile, i.e. Fuel Element Test Facility) test data for the benchmark. Several papers were presented on the analytical investigations of the PEC reactor core experiments. The paper by M. Morishita, Japan, entitled Seismic Response Analysis of PEC Reactor Core Mock-up, gives a brief review of the Japanese data on the Monju mock-up core experiment which had been distributed to the participating countries through the IAEA. Refs, figs and tabs.

21197 (IAEA-TECDOC–798, pp. 13-51) **Fluid-structure interaction experiments of PEC core mock-ups and numerical analysis performed by ENEA.** Martelli, A. (ENEA, Bologna (Italy)); Forni, M.; Bonacina, G. International Atomic Energy Agency, Vienna (Austria). May 1995. (CONF-9311319–: Research co-ordination meeting on intercomparison of liquid metal fast reactor seismic analysis codes, Vienna (Austria), 16-17 Nov 1993). In *Intercomparison of liquid metal fast reactor seismic analysis codes. V.1: Validation of seismic analysis codes using reactor core experiments. Proceedings of a research co-ordination meeting held in Vienna, 16-17 November 1993.* 181p. Order Number DE95633614. Source: OSTI; NTIS (US Sales Only); INIS.

The first part of the studies in progress in the framework of the Research Co-ordination Meeting (RCM) of IAEA CRP on "Intercomparison of Liquid Metal Fast Breeder Reactor (LMFBR) Seismic Analysis Codes" has been based on the results of dynamic experiments which were performed on various element groups of the PEC fast reactor core. In these tests, individual simplified elements and bundles of seven and nineteen simplified elements reproducing the actual fuel, reflecting and neutron shield elements in full scale were analyzed on shaking tables, in both air and water (simulating liquid sodium). Tests concerned both groups of equal elements and mixed configurations which corresponded to actual core parts. The effects of PEC core-restraint ring were also studied. Seismic excitations to 2.5 g were applied to core diagrid. The results were analyzed by ENEA using both the one-dimensional program CORALIE and the two-dimensional program CLASH. The study allowed the fluid effects in the PEC core to be evaluated; it also contributed to the validation of the above mentioned programs for their general use for fast reactor core analysis. This report describes the experimental and numerical studies and presents comparisons between ENEA calculations and measurements, stressing the most important test features and items which need for particular care in the numerical analyses of experimental data. (author). 24 refs, 19 figs, 10 tabs.

21198 (IAEA-TECDOC–798, pp. 55-78) **Seismic response analysis of the PEC reactor core mock-up.** Morishita, M. (Power Reactor and Nuclear Fuel Development Corp., Oarai, Ibaraki (Japan). Oarai Engineering Center). International Atomic Energy Agency, Vienna (Austria). May 1995. (CONF-9311319–: Research co-ordination meeting on intercomparison of liquid metal fast reactor seismic analysis codes, Vienna (Austria), 16-17 Nov 1993). In *Intercomparison of liquid metal fast reactor seismic analysis codes. V.1: Validation of seismic analysis codes using reactor core experiments. Proceedings of a research co-ordination meeting held in Vienna, 16-17 November 1993.* 181p. Order Number DE95633614. Source: OSTI; NTIS (US Sales Only); INIS.

In the framework of the Coordinated Research Program on "Intercomparison of LMFBR Seismic Analysis Codes" organized by IAEA/IWGFR, a series of dynamic and seismic response analyses was performed on the PEC reactor core mock-up experiment. The experiment is shaking table tests using up to nineteen full size mock-up elements of PEC reactor. The corresponding analyses were made by FINAS with a five element model (central row) and a twelve element model (upper half core), after some preliminary analyses. The seismic response analyses with the five element and twelve element models give fairly close responses to those measured in the experiment. From these results, it can be concluded that the present analysis is adequate with minor adjustment (damping, for example) may be done. (author). 6 refs, 13 figs, 8 tabs.

21199 (IAEA-TECDOC–798, pp. 79-98) **PEC core mock-up seismic analyses by the finds code.** Itoh, K. (Mitsubishi Atomic Power Industries, Inc., Tokyo (Japan)); Sato, T.; Aizawa, I. A core seismic analysis code finds for PWR and LMFBR core seismic designs was applied to simulate the Italian fast reactor PEC core seismic experiments. The most excited seismic wave vibration case was chosen for the validation work. The displacements and acceleration responses obtained by analyses and measurements were compared in detail. The close agreements both in displacements and accelerations in time historical domain approved that the finds code is applicable not only to PWR but also to LMFBR core analyses. (author). 3 refs, 18 figs, 8 tabs.

21200 (IAEA-TECDOC–798, pp. 99-107) **Calculation of the PEC test by the SALCON code.** Kobayashi, T. (Toshiba Corp., Yokohama (Japan)). International Atomic Energy Agency, Vienna (Austria). May 1995. (CONF-9311319–: Research co-ordination meeting on intercomparison of liquid metal fast reactor seismic analysis codes, Vienna (Austria), 16-17 Nov 1993). In *Intercomparison of liquid metal fast reactor seismic analysis codes. V.1: Validation of seismic analysis codes using reactor core experiments. Proceedings of a research co-ordination meeting held in Vienna, 16-17 November 1993.* 181p. Order Number DE95633614. Source: OSTI; NTIS (US Sales Only); INIS.

One of the PEC test was calculated by SALCON code to compare the calculation results with the experimental data as well as other analysis codes as a part of the IAEA/IWGFR/CRP on inter comparison of LMFBR seismic analysis codes. At first, features of SALCON code to minimize the computation time are described and then calculation model and condition are explained. As for the calculation result, the calculated displacements generally agreed well with the experimental data. The choice of 4% for the fraction of critical damping was found to be appropriate after evaluating the effect of damping. A reduction of dynamic freedom by Guyan reduction were found to be effective to minimize the computation time while maintaining reasonable accuracy. (author). 4 refs, 3 figs, 4 tabs.

21201 (IAEA-TECDOC–798, pp. 109-120) **Seismic analysis for PEC fast reactor core experiments using the SAFA program.** Horiuchi, T. (Hitachi Ltd., Tokyo (Japan)); Motomiya, T. International Atomic Energy Agency, Vienna (Austria). May 1995. (CONF-9311319–: Research co-ordination meeting on intercomparison of liquid metal fast reactor seismic analysis codes, Vienna (Austria), 16-17 Nov 1993). As a part of the IAEA/IWGFR coordinated research program on LMFBR seismic analysis codes, the results of the PEC fast reactor core experiments conducted by Italy were analyzed and the experimental and computational results were compared. The computer program named SAFA developed by Hitachi, Ltd. to analyze core component vibration of fast breeder reactor core components during seismic excitation, was applied for the bench mark calculation. The SAFA models subassemblies as finite element method beam elements. Fluid interaction force is considered as added mass and time integration is done using mode superposition and the method proposed by Nigam. Load paid impact is modeled using a gap, a linear spring, and a linear damper. It also uses a new method to determine the nonlinear impact force without usage of convergence iteration. The comparison of the experimental and calculational results showed a good agreement in displacement and acceleration records. (author). 13 refs, 24 figs, 2 tabs.

This paper presents the CASTEM 2000 calculations performed by CEA/DMT in the framework of the IAEA CRP on Intercomparison of LMFR Seismic Analysis Codes. They are related to the seismic behaviour of two types of MONJU core mock-ups: (a) single row layout with 29 assemblies, and (b) hexagonal cluster layout. This study is limited to the analysis of tests performed in air. (author). 7 figs.

21206 (JAERI-Research–95-007) **Experimental study on sodium void reactivity worth in mockup cores of metallic-fueled and MOX-fueled fast reactors using FCA.** Oigawa, Hiroyuki (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Iijima, Susumu. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1995. 101p. (In Japanese). Order Number DE95780485. Source: OSTI; NTIS; INIS.

To improve the calculation accuracy of the sodium void effect in fast reactors, the sodium void reactivity worths were measured at three FCA assemblies: XVI-1, XVI-2 and XVII-1. The former two assemblies simulate metallic-fueled fast reactors and the last one simulates a MOX-fueled fast reactor. Two kinds of measurements, 'step void' and 'void volume dependence', were performed in the central 3x3 drawers of the fixed side of the assemblies. In the former measurement, the axial distribution of local sodium void reactivity worths was obtained to evaluate the calculation accuracy of the non-leakage term and the leakage term separately. In the latter one, various volumes of the sodium void were simulated to evaluate the influence of void volume on the calculation accuracy. The ratios of the calculated reactivity worths to the experimental ones (C/E values) at the core center, which are dominated by the non-leakage term, are 1.08 - 1.20 by JENDL-2 and 0.95 - 1.09 by JENDL-3.1. For the leakage term, on the other hand, the present calculation shows good agreement with the measurements for three assemblies. In addition to above measurements, various extra measurements were performed in assembly XVII-1 for the detailed investigation of the calculation accuracy. The sodium void reactivity worths were measured in various plutonium isotope composition and in the core with a sodium layer which is a design to reduce the sodium void reactivity worth. (author).

21207 (LA-UR--95-1935) **Preconceptual ABC design definition and system configuration layout.** Barthold, W. (Barthold & Associates, Inc., Knoxville, TN (United States)). Los Alamos National Lab., NM (United States). Mar 1995. 145p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95014019. Source: OSTI; NTIS; INIS; GPO Dep.

This document is the conceptual design document for the follow-on to the Molten Salt Breeder Reactor, known as the ABC type reactor. It addresses blanket design options, containment options, off-gas systems, drainage systems, and components/layouts of the primary, secondary, and tertiary systems, and it contains a number of diagrams for the configuration of the major systems.

21208 (JAERI-Research--95-015) **Reactor dynamics experiment of nuclear ship Mutsu using pseudo random signal (III). The third experiment.** Hayashi, Koji (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Shimazaki, Junya; Nabeshima, Kunihiko; Ochiai, Masaaki; Shinohara, Yoshikuni; Inoue, Kimihiko. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 178p. (In Japanese). Order Number DE95780587. Source: OSTI; NTIS; INIS.

In order to investigate dynamics of the reactor plant of the nuclear ship Mutsu, the third reactor noise experiment using pseudo random binary sequences (PRBS) was performed on September 16, 1991 in the third experimental navigation. The experiments using both reactivity and load disturbances were performed at 70% of reactor power and under a normal sea condition. Each PRBS was applied by manual operation of the control rod or the main steam valve. Various signals of the plant responses and of the acceleration of ship motion were measured. Furthermore, natural reactor noise signals were measured after each PRBS experiment in order to evaluate the effects of the PRBS disturbances. This paper summarizes the planning of the experiment, the instruction for the experiment and logs, the data recording conditions, recorded signal wave forms and the results of power spectral analysis. (author).

21209 (SAND--95-0903C) **A bimodal power and propulsion system based on cermet fuel and heat pipe energy transport.** Polansky, G.F. (Sandia National Labs., Albuquerque, NM (United States)); Gunther, N.A.; Rochow, R.F.; Bixler, C.H. Sandia National Labs., Albuquerque, NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950729--4: 30. Intersociety energy conversion conference, Orlando, FL (United States), 30 Jul - 5 aug 1995). Order Number DE95011890. Source: OSTI; NTIS; INIS; GPO Dep.

Bimodal space reactor systems provide both thermal propulsion for the spacecraft orbital transfer and electrical power to the spacecraft bus once it is on station. These systems have the potential to increase both the available payload in high energy orbits and the available power to that payload. These increased mass and power capabilities can be used to either reduce mission cost by permitting the use of smaller launch vehicles or to provide increased mission performance from the current launch vehicle. A major barrier to the deployment of these bimodal systems has been the cost associated with their development. This paper describes a bimodal reactor system with performance potential to permit more than 70% of the instrumented payload of the Titan IV/Centaur to be launched from the Atlas IIAS. The development cost is minimized by basing the design on existing component technologies.

This document is NUREG-0540, Volume 17, Number 4. The Title List of Documents Made Publicly Available is a monthly publication, It contains descriptions of the information received and generated by the US NRC. This information includes (1) docketed material associated with civilian nuclear power plants and other uses of radioactive materials, and (2) nondocketed material received and generated by the NRC pertinent to its role as a regulatory agency. As used here, docketed does not refer to Court dockets; it refers to the system by which the NRC maintains its regulatory records. This series of documents is indexed by a personal author index, a corporate source index, and a report number index.

21212 (NUREG--0750-Vol.41-No.2) **Nuclear Regulatory Commission Issuances: February 1995. Volume 41, Number 2.** Nuclear Regulatory Commission, Washington, DC (United States). Div. of Freedom of Information and Publications Services. Feb 1995. 114p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

This book contains an issuance of the Nuclear Regulatory Commission and a Director's Decision. The issuance concerns consideration by the Commission of appeals from both the Initial Decision and a Reconsideration Order issued by the Presiding Officer involving two materials license amendment applications filed by the University of Missouri. The Director's Decision from the Office of Enforcement denies petitions filed by Northeast Utilities employees requesting that accelerated enforcement action be taken against Northeast Utilities for activities concerned with NU's fitness-for-duty program.

21213 (NUREG--0940-Vol.14-No.1-Pt.3) **Enforcement actions: Significant actions resolved material licensees (non-medical). Volume 14, No. 1, Part 3, Quarterly progress report, January--March 1995.** Nuclear Regulatory Commission, Washington, DC (United States). Office of Enforcement. May 1995. 427p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

This compilation summarizes significant enforcement actions that have been resolved during one quarterly period (January--March 1995) and includes copies of letters, Notices, and Orders sent by

the Nuclear Regulatory Commission to Material Licensees (non-Medical) with respect to these enforcement actions. It is anticipated that the information in this publication will be widely disseminated to managers and employees engaged in activities licensed by the NRC, so that actions can be taken to improve safety by avoiding future violations similar to those described in this publication.

21214 (NUREG—1430-Vol.2-Rev.1) **Standard technical specifications - Babcock and Wilcox Plants: Bases (Sections 2.0-3.3). Volume 2, Revision 1.** Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Reactor Regulation. Apr 1995. 293p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

This NUREG contains the improved Standard Technical Specifications (STS) for Babcock and Wilcox (B&W) plants. Revision 1 incorporates the cumulative changes to Revision 0, which was published in September 1992. The changes reflected in Revision 1 resulted from the experience gained from license amendment applications to convert to these improved STS or to adopt partial improvements to existing technical specifications. This NUREG is the result of extensive public technical meetings and discussions between the Nuclear Regulatory Commission (NRC) staff and various nuclear power plant licensees, Nuclear Steam Supply System (NSSS) Owners Groups, specifically the B&W Owners Group (BWOG), NSSS vendors, and the Nuclear Energy Institute (NEI). The improved STS were developed based on the criteria in the Final Commission Policy Statement on Technical Specifications Improvements for Nuclear Power Reactors, dated July 22, 1993 (58 FR 39132). Licensees are encouraged to upgrade their technical specifications consistent with those criteria and conforming, to the extent practical and consistent with the licensing basis for the facility, to Revision 1 to the improved STS. The Commission continues to place the highest priority on requests for complete conversions to the improved STS. Licensees adopting portions of the improved STS to existing technical specifications should adopt all related requirements, as applicable, to achieve a high degree of standardization and consistency.

21215 (LA-SUB–95-43) **Estimation of the development possibility of the ABC/ATW fuel cycle based on LiF-BeF_2 fuel salt. Part 2.** Bychkov, A.V. (State Scientific Center of Russian Federation, Dimitrovgrad (Russian Federation). Research Inst. of Atomic Reactors); Naumov, V.S. Los Alamos National Lab., NM (United States); Nauchno-Issledovatel'skij Inst. Atomnykh Reaktorov, Dimitrovgrad (Russian Federation). 1994. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95008967. Source: OSTI; NTIS; INIS; GPO Dep.

The aim of the first chapter was generalization of data on solubility and equilibrium states of fission product and actinide fluorides in fluoride salt melts-solvents and fuel composition melts based on LiF-BeF_2 mixture which was proposed as fuel basis for ABC/ATW facility. The second chapter is devoted to description of processes proposed for the chemical-technological complex of the ABC/ATW facility and their physico-chemical peculiarities. The complex is responsible for the removal of fission products and actinides from irradiated fuel salt.

21216 (ORNL/TM–12925/R1) **Materials considerations for molten salt accelerator-based plutonium conversion systems.** DiStefano, J.R.; DeVan, J.H.; Keiser, J.R.; Klueh, R.L.; Eatherly, W.P. Oak Ridge National Lab., TN (United States). Mar 1995. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95012545. Source: OSTI; NTIS; INIS; GPO Dep.

Accelerator-driven transmutation technology (ADTT) refers to a concept for a system that uses a blanket assembly driven by a source of neutrons produced when high-energy protons from an accelerator strike a heavy metal target. One application for such a system is called Accelerator-Based Plutonium Conversion, or ABC. Currently, the version of this concept being proposed by the Los Alamos National Laboratory features a liquid lead target material and a blanket fuel of molten fluorides that contain plutonium. Thus, the materials to be used in such a system must have, in addition to adequate mechanical strength, corrosion resistance to molten lead, corrosion resistance to molten fluoride salts, and resistance to radiation damage. In this report the corrosion properties of liquid lead and the LiF-BeF_2 molten salt system are reviewed in the context of candidate materials for the above application. Background information has been drawn from extensive past studies. The system operating temperature, type of protective environment, and oxidation potential of the salt are shown to be critical design considerations. Factors such as the generation of fission products and transmutation of salt components also significantly affect corrosion behavior, and procedures for inhibiting their effects are discussed. In view of the potential for extreme conditions relative to neutron fluxes and energies that can occur in an ADTT, a knowledge of radiation effects is a most important factor. Present information for potential materials selections is summarized.

21217 (SAKL-JULK–A209) **The effects of the Olkiluoto nuclear power plant on the infrastructure and the economy of the region.** Aelli, E. Satakuntaliitto, Pori (Finland). 1993. 89p. (In Finnish). Order Number DE95632481. Source: OSTI; NTIS; INIS.

The study investigates the effects of the nuclear power plant (TVO I and TVO II), situated on the island of Olkiluoto in Eurajoki municipality and owned by Industrial Power Company Ltd. (TVO), on the infrastructure and economy of the region. The report aims primarily at investigating the effects of the power units during the period they have been in function on Eurajoki municipality and Satakunta province, while it also deals with other, significant separate investments on Olkiluoto. in addition, the survey looks at the effects of a prospective third power unit (TVO III) on local economy as well as the effects of a final storage facility for spent fuel, possibly to be built in the area. (author) (94 refs., 28 figs., 3 tabs).

Office of Integrated Analysis and Forecasting. 21 Apr 1995. 82p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95011130. Source: OSTI; NTIS; GPO; INIS; GPO Dep.

Over the years real (inflation-adjusted) O&M cost have begun to level off. The objective of this report is to determine whether the industry and NRC initiatives to control costs have resulted in this moderation in the growth of O&M costs. Because the industry agrees that the control of O&M costs is crucial to the viability of the technology, an examination of the factors causing the moderation in costs is important. A related issue deals with projecting nuclear operating costs into the future. Because of the escalation in nuclear operating costs (and the fall in fossil fuel prices) many State and Federal regulatory commissions are examining the economics of the continued operation of nuclear power plants under their jurisdiction. The economics of the continued operation of a nuclear power plant is typically examined by comparing the cost of the plants continued operation with the cost of obtaining the power from other sources. This assessment requires plant-specific projections of nuclear operating costs. Analysts preparing these projections look at past industry-wide cost trends and consider whether these trends are likely to continue. To determine whether these changes in trends will continue into the future, information about the causal factors influencing costs and the future trends in these factors are needed. An analysis of the factors explaining the moderation in cost growth will also yield important insights into the question of whether these trends will continue.

21219 (ANL/RA/CP–85371) **Heterogeneous treatment in the variational nodal method.** Fanning, T.H. (Wisconsin Univ.,

Madison, WI (United States). Dept. of Nuclear Engineering and Engineering Physics); Palmiotti, G. Argonne National Lab., IL (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950420–26: International conference on mathematics and computations, reactor physics, and environmental analyses, Portland, OR (United States), 30 Apr - 4 may 1995). Order Number DE95012282. Source: OSTI; NTIS; INIS; GPO Dep.

The variational nodal transport method is reduced to its diffusion form and generalized for the treatment of heterogeneous nodes while maintaining nodal balances. Adapting variational methods to heterogeneous nodes requires the ability to integrate over a node with discontinuous cross sections. In this work, integrals are evaluated using composite gaussian quadrature rules, which permit accurate integration while minimizing computing time. Allowing structure within a nodal solution scheme avoids some of the necessity of cross section homogenization, and more accurately defines the intra-nodal flux shape. Ideally, any desired heterogeneity can be constructed within the node; but in reality, the finite set of basis functions limits the practical resolution to which fine detail can be defined within the node. Preliminary comparison tests show that the heterogeneous variational nodal method provides satisfactory results even if some improvements are needed for very difficult, configurations.

21220 (FEI–2355) **Measurement of β_{eff} and neutron lifetime in fast critical assemblies for transition from BNAB-78 constant system to BNAB-90 one.** Tarasova, O.B. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1994. 16p. (In Russian). Order Number DE95633538. Source: OSTI; NTIS (US Sales Only); INIS.

The difference between the values of effective delayed neutron fraction and of prompt neutron life-time calculated with MCDEN code using constant systems BNAB-78 and BNAB-90 is estimated for a large number of fast critical assemblies' models. The comparison with experimental results is given. It's shown that the using of BNAB-90 eliminates the neutron life-time underestimation that had place with the constant system BNAB-78. 14 refs.; 1 fig.; 6 tabs.

21221 (LA–12556-C, pp. 84-91) **Experimental and computational benchmark tests.** Gilliam, D.M.; Briesmeister, J.F. Los Alamos National Lab., NM (United States). Sep 1994. (CONF-9205206–: DOE nuclear criticality safety technology project workshop, Gaithersburg, MD (United States), 12-14 May 1992). In *Proceedings of the first annual Nuclear Criticality Safety Technology Project.* 251p. Order Number DE95000557. Source: OSTI; NTIS; INIS; GPO Dep.

A program involving principally NIST, LANL, and ORNL has been in progress for about four years now to establish a series of benchmark measurements and calculations related to the moderation and leakage of ^{252}Cf neutrons from a source surrounded by spherical aqueous moderators of various thicknesses and compositions. The motivation for these studies comes from problems in criticality calculations concerning arrays of multiplying components, where the leakage from one component acts as a source for the other components. This talk compares experimental and calculated values for the fission rates of four nuclides - ^{235}U, ^{239}Pu, ^{238}U, and ^{237}Np - in the leakage spectrum from moderator spheres of diameters 76.2 mm, 101.6 mm, and 127.0 mm, with either pure water or enriched B-10 solutions as the moderator. Very detailed Monte Carlo calculations were done with the MCNP code, using a "light water" S(α,β) scattering kernel.

21222 (LA–12556-C, pp. 92-94) **Operating experience at a University-based reactor critical facility.** Harris, D.R.; Conner, K.J.; Rohr, R.C.; Bucher, S.W. Los Alamos National Lab., NM (United States). Sep 1994. (CONF-9205206–: DOE nuclear criticality safety technology project workshop, Gaithersburg, MD (United States), 12-14 May 1992). In *Proceedings of the first annual Nuclear Criticality Safety Technology Project.* 251p. Order Number DE95000557. Source: OSTI; NTIS; INIS; GPO Dep.

Reactor critical experiments are carried out in order to validate, improve, and calibrate the extensive calculations required for licensed operation of new and reload power reactors. Many such experiments have been carried out, and new ones are required only when: (a) sufficiently new situations arise, for example, increased enrichment and new fuel types for light water (LWR) power reactors; (b) the measurements are sufficiently accurate; and (c) the measurements are sufficiently cost-effective. The Rensselaer Polytechnic Institute's Reactor Critical Facility (RCF) has an annual budget of only about $50,000 per year, and state-of-the-art critical experiments have been carried out for several years for certain relatively new situations. The low cost (at least an order of magnitude less than typical) is due to the use of students and faculty in a combined research and training mode of operation. Here the facility, its capabilities, its operation, and current research are described.

21223 (ANL/IFR/CP–84089) **Applying neural networks to optimize instrumentation performance.** Start, S.E.; Peters, G.G. Argonne National Lab., Idaho Falls, ID (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950564–8: 9. symposium on power plant dynamics, control and testing, Knoxville, TN (United States), 24-26 May 1995). Order Number DE95009466. Source: OSTI; NTIS; INIS; GPO Dep.

Well calibrated instrumentation is essential in providing meaningful information about the status of a plant. Signals from plant instrumentation frequently have inherent non-linearities, may be affected by environmental conditions and can therefore cause calibration difficulties for the people who maintain them. Two neural network approaches are described in this paper for improving the accuracy of a non-linear, temperature sensitive level probe ised in Expermental Breeder Reactor II (EBR-II) that was difficult to calibrate.

21224 (CONF-950740–42) **An interim report on shallow-flaw fracture technology development.** Pennell, W.E.; Bass, B.R.; Bryson, J.W.; McAfee, W.J. Oak Ridge National Lab., TN (United States). [1995]. 13p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. From Joint ASME/JSME pressure vessels and piping conference; Honolulu, HI (United States); 23-27 Jul 1995. Source: OSTI; NTIS; INIS.

Shallow-flaw fracture technology is being developed for application to the safety assessment of radiation-embrittled nuclear reactor pressure vessels (RPVS) containing flaws. Fracture mechanics tests on RPV steel, coupled with detailed elastic-plastic finite-element analyses of the crack-tip stress fields, have shown that (1) constraint relaxation at the crack tip of shallow surface flaws results in increased data scatter but no increase in the lower-bound fracture toughness, (2) the nil ductility temperature (NDT) performs better than the reference temperature for nil ductility transition (RT_{NDT}) as a normalizing parameter for shallow-flaw fracture toughness data, (3) biaxial loading can reduce the shallow-flaw fracture toughness, (4) stress-based dual-parameter fracture toughness correlations cannot predict the effect of biaxial loading on shallow-flaw fracture toughness because in-plane stresses at the crack tip are not influenced by biaxial loading, and (5) a strain-based dual-parameter fracture toughness correlation can predict the effect of biaxial loading on shallow-flaw fracture toughness.

21225 (CONF-950740–47) **Fracture analysis of the NESC-1 spinning cylinder experiment.** Keeney, J.A.; Bass, B.R. Oak Ridge National Lab., TN (United States). [1995]. 6p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. Interagency Agreement 1886-8570-3B. From Joint ASME/JSME pressure vessels and piping conference; Honolulu, HI (United States); 23-27 Jul 1995. Order Number DE95013203. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents finite-element analyses of the cylinder specimen being used in the international Network for Evaluating Steel Components (NESC) large-scale spinning-cylinder project (NESC-1). The objective of the NESC-1 project is to focus on a complete process for assessing the structural integrity of aged reactor pressure vessels. A new cylinder specimen was reconstituted from

segments of the previously tested SC-4 and SC-6 specimens because the relatively high fracture toughness of the original specimen might preclude achieving the test objectives. Also, the initial and coolant temperatures for the proposed thermal shock may be reduced as much as 25 C to increase the probability of achieving cleavage initiation. Analyses were carried out to determine the combined effects of increasing the wall thickness and lowering the initial and coolant temperatures in the experiment. Estimates were made of the change in hoop strain on the clad inner surface directly above a subclad crack due to initiation and axial propagation of the crack. Three-dimensional finite-element models of the cladded cylinder were generated with 6:1 and 2:1 semielliptical 70-mm-deep subclad cracks. The cylinder specimen was subjected to thermal-shock and centrifugal loading conditions and analyzed with a thermo-elastic-plastic material model. The analytical results indicate that lowering the initial and coolant temperatures by 25 C will not significantly change the peak driving force, but will shift the stress-intensity factor (K_I) vs temperature curves so that the crack will become critical at an earlier time in the transient. The peak K_I value occurs at a lower temperature which increases the probability of achieving cleavage initiation.

21226 (CONF-950804–3) **Thermal embrittlement of reactor vessel steels.** Corwin, W.R. (Oak Ridge National Lab., TN (United States)); Nanstad, R.K.; Alexander, D.J.; Stoller, R.E.; Wang, J.A.; Odette, G.R. Oak Ridge National Lab., TN (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States);Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. A doe 1886-8109-8l. From 13. international conference on structural mechanics in reactor technology; Porto Alegre (Brazil); 13-18 Aug 1995. Order Number DE95012298. Source: OSTI; NTIS; INIS; GPO Dep.

As a result of observations of possible thermal embrittlement from recent studies with welds removed from retired steam generators of the Palisades Nuclear Plant (PNP), an assessment was made of thermal aging of reactor pressure vessel (RPV) steels under nominal reactor operating conditions. Discussions are presented on (1) data from the literature regarding relatively low-temperature thermal embrittlement of RPV steels; (2)relevant data from the US power reactor-embrittlement data base (PR-EDB); and (3)potential mechanisms of thermal embrittlement in low-alloy steels.

21227 (INIS-GB–660) **Statement of nuclear incidents at nuclear installations: fourth quarter 1994.** Health and Safety Executive, London (United Kingdom). 3 Apr 1995. 7p. Order Number DE95632434. Source: OSTI; NTIS (US Sales Only); INIS.

Four nuclear incidents at installations in the United Kingdom during the fourth quarter of 1994 are reported. Reheat cracking occurred at four non-stressed-relieved welds in steam pipework at one of the two AGRs at the Dungeness B power station. Repairs have been carried out and an extensive inspection programme undertaken for welds most at risk on both reactors. The event was classified as Level O on the International Nuclear Event Scale. A small quantity of oil with a very low level of radioactive contamination was discharged into the air from the Hartlepool nuclear power station. Contamination was confined to land belonging to the utility, Nuclear Electric. The oil was traced to the vacuum services plant and measures necessary to prevent a further incident are being established. The Nuclear Installations Inspectorate was satisfied that there was no disregard of safety and the event has been classified as Level 1. A higher than normal level of CO_2, 2%, was discovered in a stairwell in a reactor building at the Dungeness B AGR station. No radioactivity was detected, the source of the leak was found and the event classified as Level O. Appropriate actions have been taken to prevent a recurrence. The final incident arose at the British Nuclear Fuels Sellafield Site. A bursting disk on an inactive compressor cooling circuit burst releasing ten cubic metres of clean water into the building operating area. The water became contaminated by 10^9 to 10^{10} Bq of beta/gamma radioactivity under a lead shielded area of floor and as a consequence of a drain blockage overflowed onto a site road. Decontamination of about 4 m^2 of road was required. No personnel were affected by radioactivity and the incident was classified as Level 1. (UK).

21228 (JAERI-Tech–95-012) **Program development of the feature extraction from an intensity image for identifying the location of the mobile robot.** Ebihara, Ken-ichi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 58p. (In Japanese). Order Number DE95780604. Source: OSTI; NTIS; INIS.

An intelligent robot, which autonomously patrols and inspects nuclear facilities instead of a human worker, needs to know its own position and orientation in the workspace. Generally, a mobile robot obtains its current position and orientation using the dead reckoning scheme in which the distance and orientation are measured by an odometer and gyrocompass. During the longtime movement of the robot, however, the accuracy of the location information gradually decreases because of accumulating error which is caused by some uncertain factors, such as slippage wheels and floor, and cannot be exactly estimated. Therefore it is necessary and important for the mobile robot to be able to correct the current location obtained by the dead reckoning scheme at anywhere in the workspace. There are some methods to correct the location information, such as infrared beacon system, detecting a mark which is put in the environment. It may be the most desirable method to estimate the position and orientation using some features extracted from and image of environmental objects taken by a CCD camera mounted on the robot. This report describes the development of the program which extracts some features from an intensity image of equipments in the nuclear facility. The output data from the program will be used to identify the location of the mobile robot in the workspace. The overview of sensing system which includes a CCD camera to take necessary images and the characteristics of the CCD camera are also reported. (author).

21229 (NUREG/CR–5591-Vol.3) **Heavy-Section Steel Irradiation Program: Volume 3, Progress report, October 1991–September 1992.** Corwin, W.R. (Oak Ridge National Lab., TN (United States)). Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering Technology; Oak Ridge National Lab., TN (United States). Feb 1995. 45p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). (ORNL/TM–11568-Vol.3). Source: OSTI; NTIS; INIS.

The primary goal of the Heavy-Section Steel Irradiation Program is to provide a thorough, quantitative assessment of the effects of neutron irradiation on the material behavior, and in particular the fracture toughness properties, of typical pressure vessel steels as they relate to light-water reactor pressure-vessel integrity. Effects of specimen size, material chemistry, product form and microstructure, irradiation fluence, flux, temperature and spectrum, and postirradiation annealing are being examined on a wide range of fracture properties. The HSSI Program is arranged into 10 tasks: (1) program management, (2) K_{Ic} curve shift in high-copper welds, (3) K_{Ia} curve shift in high-copper welds, (4) irradiation effects on cladding, (5) K_{Ic} and K_{Ia} curve shifts in low upper-shelf welds, (6) irradiation effects in a commercial low upper-shelf weld, (7) microstructural analysis of irradiation effects, (8) in-service aged material evaluations, (9) correlation monitor materials, and (10) special technical assistance. This report provides an overview of the activities within each of these tasks from October 1991 to September 1992.

21230 (NUREG/CR–5944-Vol.1) **A characterization of check valve degradation and failure experience in the nuclear power industry: 1984-1990. Volume 1.** Casada, D.A. (Oak Ridge National Lab., TN (United States)); Todd, M.D. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering; Oak Ridge National Lab., TN (United States). Sep 1993. 175p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL–6734-Vol.1). Source: OSTI; NTIS; INIS.

Check valve operating problems in recent years have resulted in significant operating transients, increased cost and decreased system availability. As a result, additional attention has beau given to check valves by utilities (resulting in the formation of the Nuclear Industry Check Valve Group), as well as the US Nuclear Regulatory Commission and the American Society of Mechanical Engineers Operation and Maintenance Committee. All these organizations have the fundamental goal of ensuring reliable operation of check valves. A key ingredient to an engineering-oriented reliability improvement effort is a thorough understanding of relevant

historical experience. A detailed review of historical failure data, available through the Institute of Nuclear Power Operation's Nuclear Plant Reliability Data System, has been conducted. The focus of the review is on check valve failures that have involved significant degradation of the valve internal parts. A variety of parameters are considered, including size, age, system of service, method of failure discovery, the affected valve parts, attributed causes, and corrective actions.

21231 (STUK/YVL-GUIDE–6.3) **Regulatory control of fuel design and manufacturing.** Finnish Centre for Radiation and Nuclear Safety (STUK), Helsinki (Finland). 1994. 12p. Order Number DE95631351. Source: OSTI; NTIS; INIS.

Translation. The original text in Finnish is published under the same guide number. The guide is valid from 1 November 1993 and will remain in force until further notice. It replaces the guide YVL 6.3 issued on 15 February 1983.

The regulatory control of the design and manufacturing of the nuclear fuel and of the control rods aims to ensure conformance to set requirements during normal operating conditions, anticipated operational transients and postulated accident conditions. The regulatory control of design, manufacturing, receiving inspections and the start of operation of the nuclear fuel are specified in the guide. The regulatory control procedure also applies to the control rods and the shield elements.

21232 (STUK/YVL-GUIDE–6.7) **Quality assurance of nuclear fuel.** Finnish Centre for Radiation and Nuclear Safety (STUK), Helsinki (Finland). 1994. 11p. Order Number DE95631352. Source: OSTI; NTIS; INIS.

Translation. The original text in Finnish is published under the same guide number. The guide is valid from 1 January 1994 and will remain in force until further notice. The guide replaces the guide YVL 6.7 issued on 11 October 1993.

The guide presents the quality assurance requirements to be completed with in the procurement, design, manufacture, transport, handling and operation of the nuclear fuel. The guide also applies to the procurement of the control rods and the shield elements to be placed in the reactor. The guide is mainly aimed for the licensee responsible for the procurement and operation of fuel, for the fuel designer and manufacturer and for other organizations whose activities affect fuel quality, the safety of fuel transport, storage and operation. 21233 (ANL/ED/CP–85853) **Failed fuel monitoring and surveillance techniques for liquid metal cooled fast reactors.** Lambert, J.D.B. (Argonne National Lab., IL (United States)); Mikaili, R.; Gross, K.C.; Strain, R.V.; Aoyama, T.; Ukai, S.; Nomura, S.; Nakae, N. Argonne National Lab., IL (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950311–3: International conference on fuel management and handling, Edinburgh (United Kingdom), 20-22 Mar 1995). Order Number DE95011954. Source: OSTI; NTIS; INIS; GPO Dep.

The Experimental Breeder Reactor II (EBR-II) has been used as a facility for irradiation of LMR fuels and components for thirty years. During this time many tests of experimental fuel were continued to cladding breach in order to study modes of element failure; the methods used to identify such failures are described in a parallel paper. This paper summarizes experience of monitoring the delayed-neutron (DN) and fission-gas (FG) release behavior of a smaller number of elements that continued operation in the run-beyond-cladding-breach (RBCB) mode. The scope of RBCB testing, the methods developed to characterize failures on-line, and examples of DN/FG behavior are described.

21234 (ANL/RA/CP–84091) **COREMAP: Graphical user interface for displaying reactor core data in an interactive hexagon map.** Muscat, F.L.; Derstine, K.L. Argonne National Lab., IL (United States). [1995]. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950420–Handbk: International conference on mathematics and computations, reactor physics, and environmental analyses, Portland, OR (United States), 30 Apr - 4 may 1995). Order Number DE95012923. Source: OSTI; NTIS; INIS; GPO Dep.

COREMAP is a Graphical User Interface (GUI) designed to assist users read and check reactor core data from multidimensional neutronic simulation models in color and/or as text in an interactive 2D planar grid of hexagonal subassemblies. COREMAP is a complete GEODST/RUNDESC viewing tool which enables the user to access multi data set files (e.g. planes, moments, energy groups ,...) and display up to two data sets simultaneously, one as color and the other as text. The user (1) controls color scale characteristics such as type (linear or logarithmic) and range limits, (2) controls the text display based upon conditional statements on data spelling, and value. (3) chooses zoom features such as core map size, number of rings and surrounding subassemblies, and (4) specifies the data selection for supplied popup subwindows which display a selection of data currently off-screen for a selected cell, as a list of data and/or as a graph. COREMAP includes a RUNDESC file editing tool which creates "proposed" Run-description files by point and click revisions to subassembly assignments in an existing EBRII Run-description file. COREMAP includes a fully automated printing option which creates high quality PostScript color or greyscale images of the core map independent of the monitor used, e.g. color prints can be generated with a session from a color or monochrome monitor. The automated PostScript output is an alternative to the xgrabsc based printing option. COREMAP includes a plotting option which creates graphs related to a selected cell. The user specifies the X and Y coordinates types (planes, moment, group, flux ,...) and a parameter, P, when displaying several curves for the specified (X, Y) pair COREMAP supports hexagonal geometry reactor core configurations specified by: the GEODST file and binary Standard Interface Files and the RUNDESC ordering.

21235 (ANL/RA/CP–84204) **A pattern-recognition-based, fault-tolerant monitoring and diagnostic technique.** Singer, R.M. (and others); Gross, K.C.; King, R.W. Argonne National Lab., Idaho Falls, ID (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9506121–2: 7. international symposium on nuclear reactor surveillance and diagnostics, Avignon (France), 19-23 Jun 1995). Order Number DE95013518. Source: OSTI; NTIS; GPO Dep.

A properly designed monitoring and diagnostic system must be capable of detecting and distinguishing sensor and process malfunctions in the presence of signal noise, varying process states and multiple faults. The technique presented in this paper addresses these objectives through the implementation of a multivariate state estimation algorithm based upon pattern recognition methodology coupled with a statistically-based hypothesis test. Utilizing a residual signal vector generated from the difference between the estimated and measured current states of a process, disturbances are detected and identified with statistical hypothesis testing. Since the hypothesis testing utilizes the inherent noise on the signals to obtain a conclusion and the state estimation algorithm requires only a majority of the sensors to be functioning to ascertain the current state, this technique has proven to be quite robust and fault-tolerant. Several examples of its application are presented.

21236 (CONF-950397–1) **Design and testing of integrated circuits for reactor protection channels.** Battle, R.E. (Oak Ridge National Lab., TN (United States)); Vandermolen, R.I.; Jagadish, U.; Swail, B.K.; Naser, J.; Rana, I. Oak Ridge National Lab., TN (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States);Electric Power Research Inst., Palo Alto, CA (United States). DOE Contract AC05-84OR21400. From Joint DOE/EPRI international conference on cost-effective instrumentation and control technology upgrades for nuclear power plants; Nashville, TN (United States); 22-24 Mar 1995. Order Number DE95012868. Source: OSTI; INIS; NTIS; GPO Dep.

Custom and semicustom application-specific integrated circuit design and testing methods are investigated for use in research

and commercial nuclear reactor safety systems. The Electric Power Research Institute and Oak Ridge National Laboratory are working together through a cooperative research and development agreement to apply modern technology to a nuclear reactor protection system. Purpose of this project is to demonstrate to the nuclear industry an alternative approach for new or upgrade reactor protection and safety system signal processing and voting logic. Motivation for this project stems from (1) the difficulty of proving that software-based protection systems are adequately reliable, (2) the obsolescence of the original equipment, and (3) the improved performance of digital processing.

21237 (LA-SUB–95-45) **Data processing unit and power system for the LANL REM instrument package. Final report.** Lockhart, W. (Southwest Research Inst., San Antonio, TX (United States). Instrumentation and Space Research Div.). Los Alamos National Lab., NM (United States); Southwest Research Inst., San Antonio, TX (United States). Instrumentation and Space Research Div. Mar 1994. 81p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95011854. Source: OSTI; NTIS; GPO Dep.

The NEPSTP spacecraft needs highly reliable instrumentation to measure the nuclear reactor health and performance. These reactor measurements are essential for initial on-orbit phase operations and documentation of performance over time. Los Alamos National Laboratory (LANL), under the guidance of W. C. Feldman, principal investigator, has designed the Radiation Environment Monitoring (REM) package to meet these needs. The instrumentation package contains two neutron detectors, one gamma-ray detector, a data processing unit, and an instrument power system. The REM package is an integration of quick turn-around, state of the practice technology for detectors, data processors, and power systems. A significant portion of REM consists of subsystems with flight history. Southwest Research Institute (SwRI) has been tasked by LANL to design support electronics, including the Data Processing Unit (DPU) and Power System for REM. The goal for this project is to use technologies from current programs to speed up and simplify the design process. To meet these design goals, the authors use an open architecture VME bus for the DPU and derivatives of CASSINI power supplies for the instrument power system. To simplify integration and test activities, they incorporate a proven software development strategy and tool kits from outside vendors. The objective of this report is to illustrate easily incorporated system level designs for the DPU, power system and ground support electronics (GSE) in support of the important NEPSTP program.

21238 (NUREG–1433-Vol.2-Rev.1) **Standard Technical Specifications General Electric plants, BWR/4: Bases (Sections 2.0-3.3). Volume 2, Revision 1.** Nuclear Regulatory Commission, Washington, DC (United States). Div. of Project Support. Apr 1995. 337p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

This report documents the results of the combined effort of the NRC and the industry produce improved Standard Technical Specifications (STS), Revision 1 for General Electric BWR/4 Plants. The changes reflected in Revision 1 resulted from the experience gained from license amendment applications to convert to these improved ST or to adopt partial improvements to existing technical specifications. This NUREG is the result of extensive public technical meetings and discussions between the Nuclear Regulatory Commission (NRC) staff and various nuclear power plant licensees, Nuclear Steam Supply System (NSSS) Owners Groups, NSSS vendors, and the Nuclear Energy Institute (NEI). The improved STS were developed based on the criteria in the Final Commission Policy Statement on Technical Specifications Improvements for Nuclear Power Reactors, dated July 22, 1993. The improved STS will be used as the basis for individual nuclear power plant licensees to develop improved plant-specific technical specifications. This report contains three volumes. Volume I contains the Specifications for all chapters and sections of the improved STS. This document, Volume 2, contains the Bases for Chapters 2.0 and 3.0, and Sections 3.1-3.3 of the improved STS. Volume 3 contains the Bases for Sections 3.4-3.10 of the improved STS.

21239 (NUREG/CR–6312) **Assessment of fiber optic pressure sensors.** Hashemian, H.M. (Analysis and Measurement Services Corp., Knoxville, TN (United States)); Black, C.L.; Farmer, J.P. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Technology; Analysis and Measurement Services Corp., Knoxville, TN (United States). Apr 1995. 130p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

This report presents the results of a six-month Phase 1 study to establish the state-of-the-art in fiber optic pressure sensing and describes the design and principle of operation of various fiber optic pressure sensors. This study involved a literature review, contact with experts in the field, an industrial survey, a site visit to a fiber optic sensor manufacturer, and laboratory testing of a fiber optic pressure sensor. The laboratory work involved both static and dynamic performance tests. In addition, current requirements for environmental and seismic qualification of sensors for nuclear power plants were reviewed to determine the extent of the qualification tests that fiber optic pressure sensors may have to meet before they can be used in nuclear power plants. This project has concluded that fiber optic pressure sensors are still in the research and development stage and only a few manufacturers exist in the US and abroad which supply suitable fiber optic pressure sensors for industrial applications. Presently, fiber optic pressure sensors are mostly used in special applications for which conventional sensors are not able to meet the requirements.

21240 (IAEA-TECDOC–795) **Validation of models using Chernobyl fallout data from the Central Bohemia region of the Czech Republic. Scenario CB. First report of the VAMP Multiple Pathways Assessment Working Group. Part of the IAEA/CEC Co-ordinated Research Programme on the Validation of Environmental Model Predictions (VAMP).** International Atomic Energy Agency, Vienna (Austria). Apr 1995. 334p. Order Number DE95633388. Source: OSTI; NTIS (US Sales Only); INIS.

The VAMP Multiple Pathways Assessment Working Group is an international forum for the testing and comparison of model predictions. The emphasis is on evaluating transfer from the environment to human via all pathways which are relevant in the environment being considered. This document is the first report of the Group and contains the results of the first test exercise on the validation of multiple pathways assessment models using Chernobyl fallout data obtained from the Central Bohemia (CB) region of the Czech Republic (Scenario CB). The report includes the following three appendixes: Documentation and evaluation of model validation data used in scenario CB (3 papers), Description of models used in scenario CB (1 paper), Individual evaluations of model predictions for scenario CB (13 papers). A separate abstract was prepared for each paper. Refs, figs and tabs.

21241 (IAEA-TECDOC–795, pp. 43-52) **Description of test scenario CB.** Kliment, V.; Bucina, I.; Malatova, I. International Atomic Energy Agency, Vienna (Austria). Apr 1995. In *Validation of models using Chernobyl fallout data from the Central Bohemia region of the Czech Republic. Scenario CB. First report of the VAMP Multiple Pathways Assessment Working Group. Part of the IAEA/CEC Co-ordinated Research Programme on the Validation of Environmental Model Predictions (VAMP).* 334p. Order Number DE95633388. Source: OSTI; NTIS (US Sales Only); INIS.

The report contains general information on the test region CB (Central Bohemia), data on radionuclide concentrations in ground-level air and on soil contamination, agricultural and demographic information, input information available on diskette and assessment tasks for model testing (total deposition, ^{137}Cs concentrations in food products, human intake, concentrations in animal feeds, whole body content, multiple pathways dose assessment). Refs, figs and tabs.

21242 (IAEA-TECDOC–795, pp. 53-63) **Measured data on Cs-137 contamination of CB environment.** Malatova, I.; Bucina, I.; Drabova, D. International Atomic Energy Agency, Vienna (Austria). Apr 1995. In *Validation of models using Chernobyl fallout data*

from the Central Bohemia region of the Czech Republic. Scenario CB. First report of the VAMP Multiple Pathways Assessment Working Group. Order Number DE95633388. Source: OSTI; NTIS (US Sales Only); INIS.

The DOSDIM (DOse Distribution Model) model is a compartmental, deterministic, radiological impact assessment model for both routine and accidental atmospheric releases. For an accidental release, dynamic transfers are used in apposition to a routine release for which equilibrium transfer factors are used. The model itself was constructed to predict best-estimates but parameter values were chosen to be conservative. Transfers between compartments are described by first-order differential equations. 3 refs, 8 figs.

21245 (IAEA-TECDOC–795, pp. 183-196) **Evaluation of CHERPAC performance for CB scenario.** Peterson, S.R. (Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs.). International Atomic Energy Agency, Vienna (Austria). Apr 1995. In *Validation of models using Chernobyl fallout data from the Central Bohemia region of the Czech Republic. Scenario CB. Order Number DE95633388. Source: OSTI; NTIS (US Sales Only); INIS.

The CHERPAC (Chalk River Environmental Research Pathways Analysis Code) model is a time-dependent model that uses inputs of daily air concentrations to calculate average monthly concentrations in the different food chain compartments contributing to ingestion dose. Dose from inhalation and external irradiation from the plume and surfaces are also calculated. 10 figs, 1 tab.

21246 (IAEA-TECDOC–795, pp. 205-212) **Application of SCHRAADLO-T performance for CB scenario.** Horyna, J. (State Office for Nuclear Safety, Prague (Czech Republic)). International Atomic Energy Agency, Vienna (Austria). Apr 1995. In *Validation of models using Chernobyl fallout data from the Central Bohemia region of the Czech Republic. Scenario CB. First report of the VAMP Multiple Pathways Assessment Working Group. Part of the IAEA/CEC Co-ordinated Research Programme on the Validation of Environmental Model Predictions (VAMP).* 334p. Order Number DE95633388. Source: OSTI; NTIS (US Sales Only); INIS.

The model SCHRAADLO was developed to assess the environmental impact of nuclear facilities. It is a time dependent compartmental model driven by daily air concentration and daily precipitation rate. The output are time dependent concentrations in soil, different types of meat and plants, milk and whole body. The model SCHRAADLO-T is a modification of the above model where some parameters have been modified according to the Chernobyl experiences. The model can be used for accidental as well as for routine releases. 2 figs, 2 tabs.

21247 (IAEA-TECDOC–795, pp. 223-226) **TERNIRBU - Evaluation of model performance for scenario CB.** Kanyar, B. (National Research Inst. for Radiobiology and Radiohygiene, Budapest (Hungary)); Fueloep, N. International Atomic Energy Agency, Vienna (Austria). Apr 1995. In *Validation of models using Chernobyl fallout data from the Central Bohemia region of the Czech Republic. Scenario CB. First report of the VAMP Multiple Pathways Assessment Working Group. Part of the IAEA/CEC Co-ordinated Research Programme on the Validation of Environmental Model Predictions (VAMP).* 334p. Order Number DE95633388. Source: OSTI; NTIS (US Sales Only); INIS.

TERNIRBU (TERrestrial model for the National Research Institute of Radiobiology and Radiohygiene, BUdapest) model consists of systems of ordinary differential equations with linear and nonlinear terms. It contains 77 parameters which can be changed at any time depending on the scenario evaluations. Therefore it can take account of any countermeasures implemented during the period of interest and other irregular changes. It can be used for predicting the radiological consequences of accidental releases of radionuclides. 3 refs, 2 figs.

21248 (IAEA-TECDOC–795, pp. 227-240) **ECOSYS-G - Individual evaluation of model performance for CB scenario.** Mueller, H. (GSF - Inst. fuer Strahlenschultz, Neuherberg (Germany)); Proehl, G. International Atomic Energy Agency, Vienna (Austria). Apr 1995. In *Validation of models using Chernobyl fallout data from the Central Bohemia region of the Czech Republic. Scenario CB. Order Number DE95633388. Source: OSTI; NTIS (US Sales Only); INIS.

The time-dependent radioecological simulation model ECOSYS has been developed in order to assess the radiological consequences of short-term depositions of radionuclides. Internal exposure via inhalation and ingestion as well as the external exposure from the passing cloud and from radioactivity deposited on the ground are included. The ingestion dose is calculated as a function of time considering 18 plant species, 11 animal food products and 18 processed products. 9 figs.

21249 (IAEA-TECDOC–795, pp. 241-252) **Individual evaluation of model performance for scenario CB.** Krajewski, P. (Central Lab. for Radiological Protection, Warsaw (Poland)); Pietrzak-Flis, Z. International Atomic Energy Agency, Vienna (Austria). Apr 1995. In *Validation of models using Chernobyl fallout data from the Central Bohemia region of the Czech Republic. Scenario CB. First report of the VAMP Multiple Pathways Assessment Working Group. Part of the IAEA/CEC Co-ordinated Research Programme on the Validation of Environmental Model Predictions (VAMP).* 334p. Order Number DE95633388. Source: OSTI; NTIS (US Sales Only); INIS.

CLRP (Concentration Levels Rapid Predictions) model was developed to examine the fate of long-lived radionuclides in the terrestrial ecosystem. Dynamic processes in the model include foliar interception, weathering, plant growth and root uptake, leaching and radioactive decay. The model considers seasonal changes in the biomass of vegetation and animal diets, specific plowing and crop-harvest dates. Human dietary data are included to permit calculation of time-dependent radionuclide ingestion rates for adult, youngster 10 years old and child 1 year old. All dynamic processes are described by exponential formulas and are solved numerically. 4 figs, 5 tabs.

21250 (IAEA-TECDOC–795, pp. 253-263) **Evaluation of LINDOZ performance for CB scenario.** Galeriu, D. (Institute of Atomic Physics, Bucharest (Romania)); Apostoaie, I.; Mocanu, N.; Paunescu, N. International Atomic Energy Agency, Vienna (Austria). Apr 1995. In *Validation of models using Chernobyl fallout data from the Central Bohemia region of the Czech Republic. Scenario CB. First report of the VAMP Multiple Pathways Assessment Working Group. Part of the IAEA/CEC Co-ordinated Research Programme on the Validation of Environmental Model Predictions (VAMP).* 334p. Order Number DE95633388. Source: OSTI; NTIS (US Sales Only); INIS.

LINDOZ model has been developed to provide the concentration of pollutants in terrestrial ecosystem (soil, vegetation, animal tissues and animal products), concentration in whole body of humans due to inhalation and ingestion, external irradiation from cloud and soil. The model is structured at process level with compartments oriented to describe transfer processes and to include the influence of physico-chemical properties of pollutants or local characteristics. As a unique feature, the model include explicitly the initial solubility of fallout particles and gases. 6 figs, 4 tabs.

21251 (IAEA-TECDOC–795, pp. 264-272) **Evaluation of PRYMA model's performance for CB scenario.** Garcia Olivares, A.J. (CIEMAT - Environmental Research Inst., Madrid (Spain)); Carrasco, E.; Suanez, A.; Font, J.L.; Cancio, D. International Atomic Energy Agency, Vienna (Austria). Apr 1995. In *Validation of models using Chernobyl fallout data from the Central Bohemia region of the Czech Republic. Scenario CB. First report of the VAMP Multiple Pathways Assessment Working Group. Part of the IAEA/CEC Co-ordinated Research Programme on the Validation of Environmental Model Predictions (VAMP).* 334p. Order Number DE95633388. Source: OSTI; NTIS (US Sales Only); INIS.

PRYMA model was developed for pathways air-food, air-pasture, air-feed (except pasture). It uses ordinary first-order differential equations for all the transfers except the root uptake where daily equilibrium is assumed. 6 figs.

21252 (IAEA-TECDOC–795, pp. 273-283) **ECOSYS-CH - Evaluation of model performance for scenario CB.** Hinton, T.G. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)). International Atomic Energy Agency, Vienna (Austria). Apr 1995. In *Validation of models using Chernobyl fallout data from the Central Bohemia region of the Czech Republic. Scenario CB. First report of the VAMP Multiple Pathways Assessment Working Group. Part of the IAEA/CEC Co-ordinated Research Programme on the Validation of Environmental Model Predictions (VAMP).* 334p. Order Number DE95633388. Source: OSTI; NTIS (US Sales Only); INIS.

ECOSYS-CH predicts the dynamics of radionuclide concentrations in grains using time-dependent leaf area indices that determine the initial plant contamination, and time-dependent translocation factors that govern the transfer of contamination from leaves to the edible portions of plants. It also accounts for the reduction of radionuclide concentrations in pasture due to plant growth by using the yield at the time of deposition and a monthly dependent loss rate, representing growth dilution. 4 figs, 5 tabs.

21253 (IAEA-TECDOC–795, pp. 284-286) **GENII - Comparison of model predictions with observations.** Napier, B.A. (Battelle Pacific Northwest Lab., Richland, WA (United States)). International Atomic Energy Agency, Vienna (Austria). Apr 1995. In *Validation of models using Chernobyl fallout data from the Central Bohemia region of the Czech Republic. Scenario CB. First report of the VAMP Multiple Pathways Assessment Working Group. Part of the IAEA/CEC Co-ordinated Research Programme on the Validation of Environmental Model Predictions (VAMP).* 334p. Order Number DE95633388. Source: OSTI; NTIS (US Sales Only); INIS.

GENII is a simplified, steady state, multiplicative chain model which gives an upper bound on potential doses resulting from hypothetical acute releases.

21254 (LA-SUB–95-21) **A three-dimensional transient neutronics routine for the TRAC-PF1 reactor thermal hydraulic computer code.** Bandini, B.R. (Los Alamos National Lab., NM (United States)). Los Alamos National Lab., NM (United States); Pennsylvania State Univ., University Park, PA (United States). Dept. of Nuclear Engineering. May 1990. 290p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95007620. Source: OSTI; NTIS; INIS; GPO Dep.

No present light water reactor accident analysis code employs both high state of the art neutronics and thermal-hydraulics computational algorithms. Adding a modern three-dimensional neutron kinetics model to the present TRAC-PF1/MOD2 code would create a fully up to date pressurized water reactor accident evaluation code. After reviewing several options, it was decided that the Nodal Expansion Method would best provide the basis for this multidimensional transient neutronic analysis capability. Steady-state and transient versions of the Nodal Expansion Method were coded in both three-dimensional Cartesian and cylindrical geometries. In stand-alone form this method of solving the few group neutron diffusion equations was shown to yield efficient and accurate results for a variety of steady-state and transient benchmark problems. The Nodal Expansion Method was then incorporated into TRAC-PF1/MOD2. The combined NEM/TRAC code results agreed well with the EPRI-ARROTTA core-only transient analysis code when modelling a severe PWR control rod ejection accident.

21255 (LA-UR–95-926) **Analysis of an AP600 intermediate-size loss-of-coolant accident.** Boyack, B.E.; Lime, J.F. Los Alamos National Lab., NM (United States). [1995]. 14p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950904–3: 7. international meeting on nuclear reactor thermal hydraulics, Saratoga, NY (United States), 10-15 Sep 1995). Source: OSTI; NTIS; INIS.

A postulated double-ended guillotine break of an AP600 direct-vessel-injection line has been analyzed. This event is characterized as an intermediate-break loss-of-coolant accident. Most of the insights regarding the response of the AP600 safety systems to the postulated accident are derived from calculations performed with the TRAC-PF1/MOD2 code. However, complementary insights derived from a scaled experiment conducted in the ROSA facility, as well as insights based upon calculations by other codes, are also presented. Based upon the calculated and experimental results, the AP600 will not experience a core heat up and will reach a safe shutdown state using only safety-class equipment. Only the early part of the long-term cooling period initiated by In-containment Refueling Water Storage Tank injection was evaluated. Thus, the observation that the core is continuously cooled should be verified for the later phase of the long-term cooling period when sump injection and containment cooling processes are important.

21256 (NUREG/CR–6318) **Data summary report for fission product release Test VI-7.** Osborne, M.F. (Oak Ridge National Lab., TN (United States)); Lorentz, R.A.; Travis, J.R.; Collins, J.L.; Webster, C.S. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Research; Oak Ridge National Lab., TN (United States). May 1995. 53p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/TM–12937). Source: OSTI; NTIS; GPO; INIS.

Test VI-7 was the final test in the VI series conducted in the vertical furnace. The fuel specimen was a 15.2-cm-long section of a fuel rod from the Monticello boiling water reactor (BWR). The fuel had experienced a burnup of ~40 Mwd/kg U. It was heated in an induction furnace for successive 20-min periods at 2000 and 2300 K in a moist air-helium atmosphere. Integral releases were 69% for 85Kr, 52% for ^{125}Sb, 71% for both ^{134}Cs and ^{137}Cs, and 0.04% for ^{154}Eu. For the non-gamma-emitting species, release values for 42% for I, 4.1% for Ba, 5.3 % for Mo, and 1.2% for Sr were determined. The total mass released from the furnace to the collection system, including fission products, fuel, and structural materials, was 0.89 g, with 37% being collected on the thermal gradient tubes and 63% downstream on filters. Posttest examination of the fuel specimen indicated that most of the cladding was completely oxidized to ZrO_2, but that oxidation was not quite complete at the upper end. The release behaviors for the most volatile elements, Kr and Cs, were in good agreement with the ORNL-Booth Model.

21257 (ANL/IFR/CP–82924) **Remote, under-sodium fuel handling experience at EBR-II.** King, R.W. (Argonne National Lab., Idaho Falls, ID (United States)); Planchon, H.P. Argonne National Lab., IL (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950311–2: International conference on fuel management and handling, Edinburgh (United Kingdom), 20-22 Mar 1995). Order Number DE95011958. Source: OSTI; NTIS; INIS; GPO Dep.

The EBR-II is a pool-type design; the reactor fuel handling components and entire primary-sodium coolant system are submerged in the primary tank, which is 26 feet in diameter, 26 feet high, and contains 86,000 gallons of sodium. Since the reactor is submerged in sodium, fuel handling operations must be performed blind, making exact positioning and precision control of the fuel handling system components essential. EBR-II operated for 30 years, and the fuel handling system has performed approximately 25,000 fuel transfer operations in that time. Due to termination of the IFR program, EBR-II was shut down on September 30, 1994. In preparation for decommissioning, all fuel in the reactor will be transferred out of EBR-II to interim storage. This intensive fuel handling campaign will last approximately two years, and the number of transfers will be equivalent to the fuel handling done over about nine years of normal reactor operation. With this demand on the system, system reliability will be extremely important. Because of this increased demand, and considering that the system has been operating for about 32 years, system upgrades to increase reliability and efficiency are proceeding. Upgrades to the system to install new digital, solid state controls, and to take advantage of new visualization technology, are underway. Future reactor designs using liquid metal coolant will be able to incorporate imaging technology now being investigated, such as ultraviolet laser imaging and ultrasonic imaging.

21258 (ANL/TD/SUMM–85849) **Experiences in the D&D of the EBWR reactor complex at Argonne National Laboratory.** Bhattacharyya, S.K.; Boing, L.E.; Fellhauer, C.R. Argonne National Lab., IL (United States). Feb 1995. 3p. Sponsored by USDOE, Washington, DC (United States). (CONF-950601–12: Annual meeting of the American Nuclear Society (ANS), Philadelphia, PA (United States), 25-29 Jun 1995). Order Number DE95013713. Source: OSTI; NTIS; INIS; GPO Dep.

EBWR went critical in Dec 1957 at 20 MW(t), was upgraded to 100 MW(t) operation. EBWR was shut down July 1967 and placed in dry lay-up. In 1986, the D&D work was planned in 4 phases: final planning and preparations for D&D, removal of reactor systems, removal of reactor vessel complex, and final decontamination and project closeout. Despite precautions, there was an uptake of ^{241}Am by D&D workers following underwater plasma arc cutting within the pool; the cause was traced to an experimental ^{241}Pu foil (200 μg) that was lost in the mid-1960s in the reactor vessel. Several major lessons were learned from this episode, among which is the fact that research facilities often involve unusual experiments which may not be recorded. Safety analysis and review procedure for D&D operations need to be carefully considered since they represent considerably different situations than reactor operations. EBWR is one of the very few cases of a prototypic reactor facility designed, operated, tested and now D&D'd by one organization.

21259 (BNL–52433-Rev.12/94-Vol.1) **Advanced Neutron Source enrichment study – Volume 1: Main report. Final report, Revision 12/94.** Bari, R.A. (Brookhaven National Lab., Upton, NY (United States). Dept. of Advanced Technology); Ludewig, H.; Weeks, J. Brookhaven National Lab., Upton, NY (United States). 31 Dec 1994. 56p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95011615. Source: OSTI; NTIS; INIS; GPO Dep.

A study has been performed of the impact on performance of using low enriched uranium (20% ^{235}U) or medium enriched uranium (35% ^{235}U) as an alternative fuel for the Advanced Neutron Source, which is currently designed to use uranium enriched to 93% ^{235}U. Higher fuel densities and larger volume cores were evaluated at the lower enrichments in terms of impact on neutron flux, safety, safeguards, technical feasibility, and cost. The feasibility of fabricating uranium silicide fuel at increasing material density was specifically addressed by a panel of international experts on research reactor fuels. The most viable alternative designs for the reactor at lower enrichments were identified and discussed. Several sensitivity analyses were performed to gain an understanding of the performance of the reactor at parametric values of power, fuel density, core volume, and enrichment that were interpolations between the boundary values imposed on the study or extrapolations from known technology. Volume 2 of this report contains 26 appendices containing results, meeting minutes, and fuel panel presentations.

21261 (BNL–61645) **The High Flux Beam Reactor at Brookhaven National Laboratory.** Shapiro, S.M. Brookhaven National Lab., Upton, NY (United States). [1994]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-941144–151: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95011401. Source: OSTI; NTIS; INIS; GPO Dep.

Brookhaven National Laboratory's High Flux Beam Reactor (HFBR) was built because of the need of the scientist to always want 'more'. In the mid-50's the Brookhaven Graphite reactor was churning away producing a number of new results when the current generation of scientists, led by Donald Hughes, realized the need for a high flux reactor and started down the political, scientific and engineering path that led to the BFBR. The effort was joined by a number of engineers and scientists among them, Chernick, Hastings, Kouts, and Hendrie, who came up with the novel design of the HFBR. The two innovative features that have been incorporated in nearly all other research reactors built since are: (i) an under moderated core arrangement which enables the thermal flux to peak outside the core region where beam tubes can be placed, and (ii) beam tubes that are tangential to the core which decrease the fast neutron background without affecting the thermal beam intensity. Construction began in the fall of 1961 and four years later, at a cost of $12 Million, criticality was achieved on Halloween Night, 1965. Thus began 30 years of scientific accomplishments.

21262 (CONF-950928–1) **Flow excursion time scales in the Advanced Neutron Source Reactor.** Sulfredge, C.D. Oak Ridge National Lab., TN (United States). [1994]. 3p. Cobalt irradiations were completed in two C-Reactor overbore tubes in support of Mission and Program investigations of isotope production. Tubes 1459 and 464 were each charged with approximately 4015 grams of cobalt in strips similar to BNL pieces described in a separate report. After discharge, the strips were placed in an underwater calorimeter to determine the heat contribution from isotopic decay, thereby allowing an assay of cobalt-60 concentrations. The cobalt-60 produced in tube 1464-C was retained by Douglas United Nuclear for source material in an underwater gamma irradiator at KE-Reactor; the remaining cobalt, from tube 1459-C, was shipped to Battelle-Northwest for further experiments and applications. A total of 396,400 Ci of cobalt-60 was produced in tube 1459-C and 272,700 Ci in tube 1464-C during the irradiations. Production in tube 1459-C occurred at the rate of 0.637 Ci/gm per 100 MWd/T of adjacent tube power; production in tube 1464-C occurred at the rate of 0.670 Ci/gm per 100 MWd/T of adjacent tube power. The total irradiation time was 880.813 full power days for tube 1459-C and 569.010 full power days for tube 1464-C.

This report presents details of the Hanford toll irradiation study. The objective of the study was to provide a basis for establishing charges for irradiation of neptunium for private parties on a toll basis.

21285 (JAERI-Research–95-005) **Analysis of energy deposition and evaluation of maximum load of irradiation capsule for NSRR experiment with uranium-zirconium hydride fuel.** Fuketa, Toyoshi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Ishijima, Kiyomi; Tanzawa, Sadamitsu; Nakamura, Takehiko; Sasajima, Hideo; Kashima, Youichi; Toyokawa, Shunji; Kobayashi, Shinsho. Japan Atomic Energy Research Inst., Tokyo (Japan). Jan 1995. 61p. (In Japanese). Order Number DE95780484. Source: OSTI; NTIS; INIS.

The new experiment plan is progressing to perform the NSRR pulse-irradiation experiment with uranium-zirconium hydride ($U\text{-}ZrH_x$) fuel which is widely utilized in the world as TRIGA reactor fuel. The uranium-zirconium hydride is a first test specimen as metallic fuel in the NSRR experiment, and has a number of individual properties, e.g. hydrogen dissociation. This report summarizes the properties of uranium-zirconium hydride fuel, and presents analysis of energy deposition during the pulse irradiation and evaluation of maximum load to test vessel, i.e. pressure pulse and mechanical forces, during the experiment. Neutronic calculation indicates that fuel temperature reaches its melting point during the pulse in the NSRR. The consideration on several aspects, including burst failure of cladding tube at low temperature, expansion of released hydrogen in the capsule and molten fuel/coolant interactions, gives predicted maximum pressure and mechanical work during the experiment. The results of maximum load evaluation will be applied for design of irradiation capsule. A relatively large safety margin has been needed for design of the uranium-zirconium hydride fuel, since information of fuel behavior during off-normal conditions is limited so far. The NSRR experiment with the uranium-zirconium hydride fuel will realize precise safety evaluation, and improve the TRIGA reactor performance. The data to be obtained in this program will also contribute development of next-generation TRIGA reactor and its safety evaluation. (author).

21286 (JAERI-Research–95-022) **Estimation of subcriticality by neutron source multiplication method.** Sakurai, Kiyoshi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Suzaki, Takenori; Arakawa, Takuya; Naito, Yoshitaka. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 56p. (In Japanese). Order Number DE95780612. Source: OSTI; NTIS; INIS.

Subcritical cores were constructed in a core tank of the TCA by arraying 2.6% enriched UO_2 fuel rods into nxn square lattices of 1.956 cm pitch. Vertical distributions of the neutron count rates for the fifteen subcritical cores (n=17, 16, 14, 11, 8) with different water levels were measured at 5 cm interval with ^{235}U micro-fission counters at the in-core and out-core positions arranging a $^{252}C_f$ neutron source at near core center. The continuous energy Monte Carlo code MCNP-4A was used for the calculation of neutron multiplication factors and neutron count rates. In this study, important conclusions are as follows: (1) Differences of neutron multiplication factors resulted from exponential experiment and MCNP-4A are below 1% in most cases. (2) Standard deviations of neutron count rates calculated from MCNP-4A with 500000 histories are 5-8%. The calculated neutron count rates are consistent with the measured one. (author).

21287 (JAERI-Research–95-026) **Development of maintenance engineering system.** Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 60p. (In Japanese). Order Number DE95780614. Source: OSTI; NTIS; INIS.

Department of JMTR project has developed the Maintenance Engineering System which evaluates the aging tendency of the facilities. The system is used for the repair plan and the replace period of parts, components, equipments or facilities. The system has the data-base which consists of the check data, the inspection data, the trouble data and the repair data at the JMTR since the virgin criticality. The system is utilized maintenance works and concludes the maintenance procedures for the failure components, equipments and facilities. This system has the following characteristics. (1) Anybody can operate the system as easily as word processor. (2) Data are put into by man-machine-interface. (3) The data sheets are with light color and the recognizable arrangements. (4) The system is cost-efficient using commercial personal computers and applications. The research card and the layouts of the

input data sheet had been formatted. Data has been begun to be put into the system and to check its functions. The result demonstrates that the system is available for preventive maintenance at the JMTR. (author).

21288 (JAERI-Tech–95-001) **Water chemistry management in cooling system of research reactor in JAERI.** Suparit, N. (Office of Atomic Energy for Peace, Bangkok (Thailand)); Yoshijima, Tetsuo; Tanaka, Sumitoshi. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1995. 66p. Order Number DE95780586. Source: OSTI; NTIS; INIS.

The department of research reactor presently operates three research reactors (JRR-2, JRR-3M and JRR-4). For controlling and management of water and gas in each research reactor are performed by the staffs of the research reactor technology development division. Water chemistry management of each research reactor is one of the important subject. The main objects are to prevent the corrosion of water cooling system and fuel elements, to suppress the plant radiation build-up and to minimize the radioactive waste. In this report describe a outline of each research reactor facilities, radiochemical analytical methods and chemical analytical methods for water chemistry management. (author).

21289 (LA-SUB–94-72) **Los Alamos National Laboratory Omega West Reactor restart.** Los Alamos National Lab., NM (United States); Burns and Roe Utility Management Consultants, Gales Ferry, CT (United States). 27 Aug 1993. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95011064. Source: OSTI; NTIS; INIS; GPO Dep.

This report is a critical evaluation of the effort for the restart of the Omega West reactor. It is divided into the following areas: progress made; difficulties in restart effort; current needs; and suggested detailed steps for improvement. A brief discussion is given for each area of study.

21291 (WHC-SD-FF-ANAL–003) **Snubber reduction analysis of secondary hot leg.** Chen, W.W. Westinghouse Hanford Co., Richland, WA (United States). 14 Apr 1995. 211p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010737. Source: OSTI; NTIS; INIS; GPO Dep.

The analysis is to verify the structural integrity of the Secondary Hot Leg Dump Heat Exchanger piping system of Fast Flux Test Facility (FFTF) under seismic loading after the deletion of seismic snubbers. ADLPIPE computer code was used to perform the analyses. Results of the piping stress analysis with snubber reduction are qualified in accordance with ASME Section II Class 1 requirements. The effects of inelastic strain accumulation, creep-fatigue damage and interaction, and elastic follow-up are evaluated. Anchor and hanger loads are evaluated by comparing with those from qualified seismic report.

Brookhaven National Lab., Upton, NY (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950426–3: 3. international conference on nuclear engineering, Kyoto (Japan), 23-27 Apr 1995). Order Number DE95011402. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the results of an analysis of loss of coolant accidents (LOCA's) for the Soviet designed, light water cooled and moderated reactors referred to as VVERS. The VVER unit selected for this analysis is designated as VVER-440 Model 213. This plant generates 440 MWe and is of current interest since fifteen are now operating and additional units are in various stages of construction within Eastern Europe and the New Independent States. In addition to the analysis of two base case LOCA'S, this paper also presents the results of several sensitivity studies related to single failures in various plant systems that have been included in the design to mitigate the effects of LOCA's on plant and fuel system performance. Examples of the safety systems selected for these sensitivity studies include the scram system, the accumulators, and the high pressure injection system.

21293 (BNL-NUREG–60573) **Mixing phenomena of interest to boron dilution during small break LOCAs in PWRs.** Nourbakhsh, H.P.; Cheng, Z. Brookhaven National Lab., Upton, NY (United States). [1995]. 17p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). (CONF-950904–5: 7. international meeting on nuclear reactor thermal hydraulics, Saratoga, NY (United States), 10-15 Sep 1995). Order Number DE95008862. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents the results of a study of mixing phenomena related to boron dilution during small break loss of coolant accidents (LOCAs)in pressurized water reactors (PWRs). Boron free condensate can accumulate in the cold leg loop seals when the reactor is operating in a reflux/boiler-condenser mode. A problem may occur when subsequent change in flow conditions such as loop seal clearing or re-establishment of natural circulation flow drive the diluted water in the loop seals into the reactor core without sufficient mixing with the highly borated water in the reactor downcomer and lower plenum. The resulting low boron concentration coolant entering the core may cause a power excursion leading to fuel failure. The mixing processes associated with a slow moving stream of diluted water through the loop seal to the core are examined in this paper. Bounding calculations for boron concentration of coolant entering the core during a small break LOCA in a typical Westinghouse-designed four-loop plant are also presented.

21294 (CEA-CONF–11828) **Reflood modeling under oscillatory flow conditions with Cathare.** Kelly, J.M.; Bartak, J.; Janicot, A. CEA Centre d'Etudes de Grenoble, 38 (France). Dept. de Thermohydraulique et de Physique. 1993. 25p. (CONF-931005–: 6. international topical meeting on nuclear reactor thermal hydraulics, Grenoble (France), 5-8 Oct 1993). Order Number DE95631673. Source: OSTI; NTIS (US Sales Only); INIS.

The problems and the current status in oscillatory reflood modelling with the CATHARE code are presented. The physical models used in CATHARE for reflood modelling predicted globally very well the forced reflood experiments. Significant drawbacks existed in predicting experiments with oscillatory flow (both forced and gravity driven). First, the more simple case of forced flow oscillations was analyzed. Modelling improvements within the reflooding package resolved the problem of quench front blockages and unphysical oscillations. Good agreements with experiment for the ERSEC forced oscillations reflood tests is now obtained. For gravity driven reflood, CATHARE predicted sustained flow oscillations during 100-150 s after the start of the reflood, whereas in the experiment flow oscillations were observed only during 25-30 s. Possible areas of modeling improvements are identified and several new correlations are suggested. The first test calculations of the BETHSY test 6.7A4 have shown that the oscillations are mostly sensitive to heat flux modeling downstream of the quench front. A much better agreement between CATHARE results and the experiment was obtained. However, further effort is necessary to obtain globally satisfactory predictions of gravity driven system reflood tests. (authors) 6 figs., 35 refs.

21295 (CONF-9506121–1) **Monte Carlo verification of point kinetics for safety analysis of nuclear reactors.** Valentine, T.E. (Oak Ridge National Lab., TN (United States). Instrumentation and Controls Div.); Mihalczo, J.T. Oak Ridge National Lab., TN (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 7. international symposium on nuclear reactor surveillance and diagnostics;

Avignon (France); 19-23 Jun 1995. Order Number DE95012846. Source: OSTI; NTIS; INIS; GPO Dep.

Monte Carlo neutron transport methods can be used to verify the applicability of point kinetics for safety analysis of nuclear reactors. KENO-NR was used to obtain the transfer function of the Advanced Neutron Source reactor and the time delay between the core power production and the external detectors, a parameter of interest to the safety systems design. The good agreement between the Monte Carlo generated transfer function and the point kinetics transfer function validates that the uncommon ANS geometry does not preclude the use of point kinetics in the frequency range that was investigated. Various features of the power spectral densities also demonstrated the applicability of point kinetics. The time delay was obtained from the cross-power spectral density (CPSD) and is ~15 ms. These analyses show that frequency analysis can be used experimentally to investigate the validity of the use of point kinetics models in critical experiments or zero power testing of reactors.

21296 (CONF-950904–4) **Flow excursion time scales in the advanced neutron source reactor.** Sulfredge, C.D. Oak Ridge National Lab., TN (United States). [1995]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 7. international meeting on nuclear reactor thermal hydraulics; Saratoga, NY (United States); 10-15 Sep 1995. Order Number DE95009181. Source: OSTI; NTIS; INIS; GPO Dep.

Flow excursion transients give rise to a key thermal limit for the proposed Advanced Neutron Source (ANS) reactor because its core involves many parallel flow channels with a common pressure drop. Since one can envision certain accident scenarios in which the thermal limits set by flow excursion correlations might be exceeded for brief intervals, a key objective is to determine how long a flow excursion would take to bring about a system failure that could lead to fuel damage. The anticipated time scale for flow excursions has been examined by subdividing the process into its component phenomena: bubble nucleation and growth, deceleration of the resulting two-phase flow, and finally overcoming thermal inertia to heat up the reactor fuel plates. Models were developed to estimate the time required for each individual stage. Accident scenarios involving sudden reduction in core flow or core exit pressure have been examined, and the models compared with RELAP5 output for the ANS geometry. For a high-performance reactor like the ANS, flow excursion time scales were predicted to be in the millisecond range, so that even very brief transients might lead to fuel damage. These results should prove useful whenever one must determine the time involved in any portion of a flow excursion transient.

21297 (CONF-9509162–1) **Thorium: Uranium fuel cycle in safe reactors, the time is now.** Gat, Uri. Oak Ridge National Lab., TN (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (CONF-9504164–1: Global '95; Roane/Anderson Professional Society meeting, Versailles (France); Oak Ridge, TN (United States), 11 Sep 1995; 12 apr 1995). Order Number DE95012297. Source: OSTI; NTIS; INIS; GPO Dep.

The thorium-uranium fuel cycle has several advantages that make it attractive. Some of these beneficial properties are of particular interest now as they help alleviate current concerns. The Th-U cycle has neutronic advantages when utilized in thermal or epithermal reactors. Some of these reactors enjoy extraordinary safety qualities. The combination of these traits suggest that now is an appropriate time to deploy and begin exploiting the Th-U fuel cycle.

21298 (DOE/ER/12815–T1-Pt.1) **Model development for the dynamic analysis of the OSU inherently safe reactor. Part 1.** Aybar, H.S. Ohio State Univ. Research Foundation, Columbus, OH (United States). 1992. 201p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER12815. Order Number DE95009692. Source: OSTI; NTIS; INIS; GPO Dep.

Faculty and students in the Nuclear Engineering Program at the Ohio State University (OSU) have proposed a conceptual design for an inherently safe 340 MWe power reactor. The design is based on the state-of-the-art technology of LWRs and the High Temperature Gas- cooled Reactors (HTGRs). The OSU Inherently Safe Reactor (OSU-ISR) concept uses shorter than standard BWR fuel elements in the reactor core. All the fluid on the primary side is contained within a Prestressed Concrete Reactor Vessel (PCRV). This important feature significantly reduces the probability of a LOCA. A new feature of the OSU-ISR is an operator independent steam driven Emergency Core Cooling System (ECCS) housed within the PCRV. In accident conditions where the steam generators are incapacitated, steam from the core drives a jet injector, which takes water from the suppression pool and pumps it into the core cavity to maintain core coverability. The preliminary analysis of the concept was performed as a design project in the Nuclear Engineering Program at the OSU during the Spring of 1985, and published in "Nuclear Technology." The use of a PCRV for ducting and containment and the replacement of forced recirculation with natural circulation on the primary side significantly improve the inherent safety of the plant. Currently, work is in progress for the refinement of the OSU-ISR concept, partially supported by a grant from the U.S. Department of Energy.

21299 (DOE/ER/12815–T1-Pt.2) **Phenomenological and mathematical modeling of a high pressure steam driven jet injector. Part 2.** Anand, G. Ohio State Univ. Research Foundation, Columbus, OH (United States). 1993. 201p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER12815. Order Number DE95012601. Source: OSTI; NTIS; INIS; GPO Dep.

An injector is a particular type of jet pump which uses condensable vapor to entrain a liquid and discharge against a pressure higher than either motive or suction pressures. The injector has no moving parts and requires no external power supply nor any complex control system. Thus, the injector is particularly suited for emergency core cooling operations. A detailed survey has indicated that various injector designs are available for operating pressures below 250 psig. However, the design of these injectors from the viewpoint of a basic understanding of heat and mass transfer processes has not been well developed. A critical review of the models showed serious discrepancies between the analytical models and the experimental observations. The discrepancies evolved from the neglect of non-equilibrium aspects of the flow. The origin of the non-equilibrium aspects can be traced to the extremely small time scales governing the flow in the injector. Thus, time scales of the order of 10^{-2} seconds are involved in the injector, accompanied by mass, momentum, and heat transfer rates of orders of magnitude higher than that observed in conventional two-phase flows. The present study focuses on the phenomenological and mathematical modeling of the processes in the injector from the viewpoint of its non-equilibrium nature.

21300 (DOE/ER/12815–T1-Pt.3) **Probabilistic assessment of dynamic system performance. Part 3.** Belhadj, M. Ohio State Univ. Research Foundation, Columbus, OH (United States). 1993. 378p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER12815. Order Number DE95012602. Source: OSTI; NTIS; INIS; GPO Dep.

Accurate prediction of dynamic system failure behavior can be important for the reliability and risk analyses of nuclear power plants, as well as for their backfitting to satisfy given constraints on overall system reliability, or optimization of system performance. Global analysis of dynamic systems through investigating the variations in the structure of the attractors of the system and the domains of attraction of these attractors as a function of the system parameters is also important for nuclear technology in order to understand the fault-tolerance as well as the safety margins of the system under consideration and to insure a safe operation of nuclear reactors. Such a global analysis would be particularly relevant to future reactors with inherent or passive safety features that are expected to rely on natural phenomena rather than active components to achieve and maintain safe shutdown. Conventionally, failure and global analysis of dynamic systems necessitate the utilization of different methodologies which have computational limitations on the system size that can be handled. Using a Chapman-Kolmogorov interpretation of system dynamics, a theoretical basis is developed that unifies these methodologies as special cases and which can be used for a comprehensive safety and reliability analysis of dynamic systems.

21301 (DOE/ER/12900–T1) **Breakup of metal jets penetrating a volatile liquid. Final report, October 1, 1991–February 28, 1993.** Schneider, J.P. Illinois Univ., Urbana, IL (United States).

Dept. of Nuclear Engineering. [1995]. 237p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-89ER12900. Order Number DE95014740. Source: OSTI; NTIS; GPO Dep.

In a loss of coolant accident, the core may become uncovered, causing the fuel pins to melt. The molten fuel would pour onto the plenum and collect on the reactor pressure vessel (RPV) lower head. The RPV internal structure includes one or more perforated plates in the lower plenum which would divide the molten fuel into small diameter streams or jets, which would break up as they penetrate the coolant in the lower plenum. The breakup of these jets would occur in two phases, each dominated by a distinct fragmentation mechanism. As a fuel jet first penetrates the coolant, a stagnation flow develops at its leading edge, causing the column to spread radially and eject molten fuel into the coolant. The jet fluid in the column is fragmented by pressure fluctuations due to the jet/ambient fluid relative motion, so that a steady jet is reduced to a field of falling drops below a critical depth called the breakup length. The present work includes analyses yielding simple correlations for jet breakup length and jet leading edge penetration.

21302 (DOE/ER/12900–T2) **Experimental observations of the breakup of multiple metal jets in a volatile liquid.** Marciniak, M.J. Illinois Univ., Urbana, IL (United States). Dept. of Nuclear Engineering. [1995]. 143p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-89ER12900. Order Number DE95015001. Source: OSTI; NTIS; GPO Dep.

A postulated severe loss of coolant accident in a nuclear reactor can lead to significant core damage due to residual heat generation. Subsequently, melted core materials (i.e.; corium) could migrate downward and impinge upon the lower head of the reactor pressure vessel (RPV). During this relocation, the complexity of the reactor structure could segregate the molten corium into various flow paths. A perforated flow plate could readily provide the mechanism to segregate the molten corium. The resulting small (a few cm) diameter melt streams, driven by gravity, could then penetrate the remaining coolant in the RPV and cause any of the following events: impingement of the high temperature melt streams on the lower head could breach the RPV; re-agglomeration of the corium melt on the lower head could influence the coolability of the debris bed; "pre-mixing" of the melt streams with the coolant could lead to a vapor explosion; or, sufficient quenching of the melt streams by the coolant could produce a stabilized debris bed. An overview of the thermo-science issues related to core-melt accidents is presented by Theofanous. Thus, insight into the melt stream breakup mechanisms (i.e.; interfacial conditions, fragmentation, and geometric spacing) during the melt-coolant interactions is necessary to evaluate the plausibility, and characteristics, of these events. Molten Fuel Stream Breakup Simulation (MFSBS) experiments have been performed at Argonne National Laboratory in which simulant materials were used to determine a 'boiling' jet breakup length correlation and to visualize the melt fragmentation mechanisms during the penetration of a single molten metal jet into a volatile liquid. The goal was to characterize the hydrodynamics of the corium-water interactions in a postulated core melt accident. The present experiment closely follows the procedures of the MFSBS.

21303 (DOE/ID–10489) **The study of steam explosions in nuclear systems. Advanced Reactor Severe Accident Program.** Theofanous, T.G. (California Univ., Santa Barbara, CA (United States). Center for Risk Studies and Safety); Yuen, W.W.; Angelini, S.; Chen, X. USDOE Idaho Operations Office, Idaho Falls, ID (United States); California Univ., Santa Barbara, CA (United States). Center for Risk Studies and Safety. Jan 1995. 425p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95010681. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents an overview of the steam explosion issue in nuclear reactor safety and our approach to assessing it. Key physics, models, and computational tools are described, and illustrative results are presented for ex-vessel steam explosions in an open pool geometry. An extensive set of appendices facilitate access to previously reported work that is an integral part of this effort. These appendices include key developments in our approach, key advances in our understanding from physical and numerical experiments, and details of the most advanced computational results presented in this report. Of major significance are the following features: A consistent two-dimensional treatment for both premixing and propagation which in practical settings are ostensibly at least two-dimensional phenomena; experimental demonstration of voiding and microinteractions which represent key behaviors in premixing and propagation respectively; demonstration of the explosion venting phenomena in open pool geometries which, therefore, can be counted on as a very important mitigative feature; and introduction of the idea of penetration cutoff as a key mechanism prohibiting large-scale premixing in usual ex-vessel situations involving high pour velocities and subcooled pools. This report is intended as an overview and is to be followed by code manuals for PM-ALPHA and ESPROSE.m, respective verification reports, and application documents for reactor-specific applications. The applications will employ the Risk Oriented Accident Analysis Methodology (ROAAM) to address the safety importance of potential steam explosions phenomena in evaluated severe accidents for passive Advanced Light Water Reactors (ALWRs).

21304 (DOE/NV–367) **FRMAC-93 lessons learned report.** Kerns, K.C. (comp.). EG and G Energy Measurements, Inc., Las Vegas, NV (United States). Mar 1994. 49p. Sponsored by USDOE, Washington, DC (United States);Federal Emergency Management Agency, Washington, DC (United States);Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC08-93NV11265. Order Number DE95012785. Source: OSTI; NTIS; INIS; GPO Dep.

FRMAC-93 simulated a radiological accident at the Fort Calhoun nuclear power plant, 25 miles north of Omaha, Nebraska. The exercise involved the state Iowa and Nebraska, NRC as the lead Federal agency, FRMAC (Federal Radiological Monitoring and Assessment Center), and several federal agencies with statutory emergency responsibility. FRMAC-93 was a major 2-day field exercise designed to determine the effectiveness, coordination, and operations of a DOE-managed FRMAC. Other objectives were to ensure that appropriate priorities were established and assistance was provided to the states and the lead Federal agency by FRMAC. Day 1 involved the Fort Calhoun evaluated plume phase exercise. On Day 2, the flow of data, which was slow initially, improved so that confidence of states and other federal responders in FRMAC support capabilities was high. The impact and lessons learned from FRMAC-93 provided the necessary impetus to make organizational and operational changes to the FRMAC program, which were put into effect in the DOE exercise FREMONT at Hanford 3 months later.

21305 (GRS–110) **17. meeting of the Society for Reactor Safety. Proceedings.** Gesellschaft fuer Anlagen- und Reaktorsicherheit (GRS) mbH, Garching (Germany). Jun 1994. 77p. (In German). (CONF-9310338–: 17. meeting of the Society for Reactor Safety, Koeln (Germany), 6-7 Oct 1993). Order Number DE95780099. Source: OSTI; NTIS (US Sales Only); INIS.

An autonomous and independent reactor safety research in Germany is indispensable. Three out of the four papers of the meeting deal with the protective aim concept of NPP. Deterministic safety assessment during periodic in-service inspections, a new generation of information engineering, and the incorporation of serious accidents in the containment design of new reactors are considered in detail. (DG)

21306 (GRS–110, pp. 7-26) **The protective aim concept - a proposal for deterministic safety assessment during periodic in-service inspections of nuclear power plants.** Mertins, M. (Gesellschaft fuer Reaktorsicherheit (Greece), Koeln (Germany). Bereich Betriebsverhalten); Rittig, D. Gesellschaft fuer Anlagen- und Reaktorsicherheit (GRS) mbH, Garching (Germany). Jun 1994. 77p. (In German). (CONF-9310338–: 17. meeting of the Society for Reactor Safety, Koeln (Germany), 6-7 Oct 1993). In *17. meeting of the Society for Reactor Safety. Proceedings.* Order Number DE95780099. Source: OSTI; NTIS (US Sales Only); INIS.

The protective aim concept is a proposal designed to entirely cover the proven "defence-in-depth" concept by means of design-independent safety requirements. These requirements are oriented according to the concerns of a uniform safety assessment of existing nuclear power plants. They take into account the safety-relevant data defined in the nuclear set of rules as well as significant recent

findings on safety, and thus characterize the safety level in accordance with the state-of-the-art technology. The crucial importance of representative incidents or states under the protective aim concept, the principles to be observed together with the required minimum barriers, and the plant states with precautionary measures relevant to the different levels are represented. The protective aim concept in normal operation is based on observed incidents. Both here an on the accident level it follows up trends in order to fully utilized also these possibilities of safety improvement. (orig.)

21307 (GRS–110, pp. 27-42) **The new generation of information engineering - improved safety when used in nuclear power plants.** Bastl, W. (Institut fuer Sicherheitstechnologie, Garching (Germany)). Gesellschaft fuer Anlagen- und Reaktorsicherheit (GRS) mbH, Garching (Germany). Jun 1994. 77p. (In German). (CONF-9310338–: 17. meeting of the Society for Reactor Safety, Koeln (Germany), 6-7 Oct 1993). In *17. meeting of the Society for Reactor Safety. Proceedings.* Order Number DE95780099. Source: OSTI; NTIS (US Sales Only); INIS.

Based on several examples, the new methods of information technology are shown by which the operator is much better connected to what happens in the plant than he has been so far. Of crucial importance is the transition from system-oriented to task-oriented information made possible by the application of digital technique. By using computer-aided diagnostic and prognostic methods, the mental image of plant events is essentially supported, above all in complex and intricate situations. The safety benefit realizable by this is immeasurable. It results in a gain of time in the assessment of a plant situation; prognoses on possible developments of an incident or support for the application of procedures. (orig.)

21308 (GRS–110, pp. 43-56) **Inclusion of serious accidents in the containment design of new reactors.** Wolfert, K. (Gesellschaft fuer Reaktorsicherheit (Greece), Garching (Germany). Bereich Thermohydraulik); Rohde, J. Gesellschaft fuer Anlagen- und Reaktorsicherheit (GRS) mbH, Garching (Germany). Jun 1994. 77p. (In German). (CONF-9310338–: 17. meeting of the Society for Reactor Safety, Koeln (Germany), 6-7 Oct 1993). In *17. meeting of the Society for Reactor Safety. Proceedings.* Order Number DE95780099. Source: OSTI; NTIS (US Sales Only); INIS.

The area of beyond design basis accidents was intensely and expansively studied in connection with the introduction of in-plant emergency measures as an additional safety level. Probabilistic safety analyses show impressively the gain in safety realizable by in-plant emergency measures. Research work on the phenomena of serious accidents, including those leading to a complete core meltdown, has been done since the beginning of reactor safety research parallely to studies of the problems involved in design basis accidents. Over the last few years the importance of analyzing accident-related phenomena and their possible consequences has increased. This development has been intensified both by the TMI and Chernobyl reactor accidents and by the demand for taking into account serious accidents in the design of new reactors. Summarizing it is said that available operating experience and findings from research and development projects constitute a well-balanced basis for the development of the new light water reactor. (orig.)

21309 (GRS-F–1/1994) **Reports on research programs in the field of reactor safety sponsored by the Federal Ministry of Research and Technology. Reported period: January 1 to June 30, 1994.** Gesellschaft fuer Anlagen- und Reaktorsicherheit (GRS) mbH, Koeln (Gemany). 1994. 309p. (In German). Sponsored by Bundesministerium fuer Bildung, Wissenschaft, Forschung und Technologie, Bonn (Germany). Order Number DE95785362. Source: OSTI; NTIS (US Sales Only); INIS.

Each progress report represents a compilation of individual reports about objectives, the work performed, the results, the next steps of the work etc. The individual reports are prepared in a standard form by the contractors themselves as a documentation of their progress in work and published by the Forschungsbetreuung at the GRS, (FB) (Research Coordination Department), within the framework of general informations of progress in reactor safety research. The individual reports are classified according to the research program of the safety of LWR 1977 - 1980 of the BMFT. Another table of uses the same classification system as applied in the nuclear safety index of the CEC (Commission of the European Communities) and the OECD (Organization for Economic Cooperation and Development). The reports are arranged in sequence of their project numbers. (orig.)

21310 (LA–12556-C, pp. 216-225) **LACEF SAR & accident envelope.** Paternoster, R. (Los Alamos National Lab., NM (United States)). Los Alamos National Lab., NM (United States). Sep 1994. (CONF-9205206–: DOE nuclear criticality safety technology project workshop, Gaithersburg, MD (United States), 12-14 May 1992). In *Proceedings of the first annual Nuclear Criticality Safety Technology Project.* 251p. Order Number DE95000557. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper was a discussion of the safety analysis report for the Los Alamos LACEF. Status of the SAR was noted, and the accidents analyzed were also noted. These included the maximum consequence accidents and the DBAs for each of the LACEF facilities.

21311 (LA–12556-C, pp. 226-232) **Analysis of accident consequences in support of the preparation of the LACEF safety analysis report.** Hetrick, D.L. Los Alamos National Lab., NM (United States). Sep 1994. (CONF-9205206–: DOE nuclear criticality safety technology project workshop, Gaithersburg, MD (United States), 12-14 May 1992). In *Proceedings of the first annual Nuclear Criticality Safety Technology Project.* 251p. Order Number DE95000557. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper was a brief discussion of accident analyses for the following LACEF facilities: (1) WINCO Double Slab Tank geometry on the comet assembly machine; (2) SHEBA; (3) flattop assembly; and (4) CNDS on the MARS assembly machine.

21312 (NUREG–1501) **Background as a residual radioactivity criterion for decommissioning: Appendix A to the Generic Environmental Impact Statement in support of rulemaking on radiological criteria for decommissioning of NRC-licensed nuclear facilities. Draft report.** Huffert, A.M. (Nuclear Regulatory Commission, Washington, DC (United States)); Meck, R.A.; Miller, K.M. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications. Aug 1994. 95p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

This report was originally published as an appendix to the draft U.S. Nuclear Regulatory Commission (NRC) document entitled, "Generic Environmental Impact Statement in Support of Rulemaking on Radiological Criteria for Decommissioning of NRC-Licensed Nuclear Facilities." Because of the great interest in this report by members of the public, citizen and environmental organizations, academicians, licensees, and regulators, the NRC staff is publishing this report separately, so that it can be readily available to a diverse audience. This report was created to assist both the NRC staff and interested members of the public in evaluating background radiation (background) as a decommissioning criterion, by serving as a primer on background and providing information on the existing applications of background in regulatory criteria and standards. This report also discusses some of the methods available to measure and distinguish between the very low radiation levels associated with background and man-made sources of radiation. Two approaches are considered for applying background as a decommissioning criterion; these are the use of background dose rates and background radionuclide concentrations. This report concludes that the temporal and spatial variability of background produces a wide range of doses to United States residents, which prevents the application of background dose rates as a decommissioning criterion. Instead, this report recommends that local background radionuclide concentrations serve as a benchmark for decommissioning criteria, while taking into account the concept of reducing residual radioactivity to a level as low as is reasonably achievable.

21313 (NUREG/CP–0140-Vol.1) **Twenty-second water reactor safety information meeting: Proceedings. Volume 1: Plenary session; Advanced instrumentation and control hardware and software; Human factors research; IPE and PRA.** Monteleone, S. (comp.) (Brookhaven National Lab., Upton, NY (United States)). Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research;

Brookhaven National Lab., Upton, NY (United States). Apr 1995. 391p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). (CONF-9410216–Vol.1: 22. water reactor safety information meeting, Bethesda, MD (United States), 24-26 Oct 1994). Source: OSTI; NTIS; GPO; INIS.

This three-volume report contains papers presented at the Twenty-Second Water Reactor Safety Information Meeting held at the Bethesda Marriott Hotel, Bethesda, Maryland, during the week of October 24–26, 1994. The papers are printed in the order of their presentation in each session and describe progress and results of programs in nuclear safety research conducted in this country and abroad. Foreign participation in the meeting included papers presented by researchers from Finland, France, Italy, Japan, Russia, and United Kingdom. The titles of the papers and the names of the authors have been updated and may differ from those that appeared in the final program of the meeting. Selected papers are indexed separately for inclusion in the Energy Science and Technology Database.

21315 (NUREG/CR–6109) **The probability of containment failure by direct containment heating in surry.** Pilch, M.M. (Sandia National Labs., Albuquerque, NM (United States)); Allen, M.D.; Bergeron, K.D.; Tadios, E.L.; Stamps, D.W.; Spencer, B.W.; Quick, K.S.; Knudson, D.L. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Safety Technology; Sandia National Labs., Albuquerque, NM (United States); EG and G Idaho, Inc., Idaho Falls, ID (United States); Argonne National Lab., IL (United States). May 1995. 268p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC04-94AL85000 ; AC07-94ID13223 ; W-31109-ENG-38. (SAND–93-2078). Source: OSTI; NTIS; GPO; INIS.

In a light-water reactor core melt accident, if the reactor pressure vessel (RPV) fails while the reactor coolant system (RCS) at high pressure, the expulsion of molten core debris may pressurize the reactor containment building (RCB) beyond its failure pressure. A failure in the bottom head of the RPV, followed by melt expulsion and blowdown of the RCS, will entrain molten core debris in the high-velocity steam blowdown gas. This chain of events is called a high-pressure melt ejection (HPME). Four mechanisms may cause a rapid increase in pressure and temperature in the reactor containment: (1) blowdown of the RCS, (2) efficient debris-to-gas heat transfer, (3) exothermic metal-steam and metal-oxygen reactions, and (4) hydrogen combustion. These processes, which lead to increased loads on the containment building, are collectively referred to as direct containment heating (DCH). It is necessary to understand factors that enhance or mitigate DCH because the pressure load imposed on the RCB may lead to early failure of the containment.

21316 (NUREG/CR–6331) **Atmospheric relative concentrations in building wakes.** Ramsdell, J.V. Jr. (Pacific Northwest Lab., Richland, WA (United States)); Simonen, C.A.; Smyth, S.B. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Radiation Safety and Safeguards; Pacific Northwest Lab., Richland, WA (United States). May 1995. 127p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC06-76RL01830. (PNL–10521). Source: OSTI; NTIS; GPO; INIS.

This report documents the ARCON95 computer code developed for the U.S. Nuclear Regulatory Commission Office of Nuclear Regulatory Research for use in control room habitability assessments. The document includes a user's guide to the code, a description of the technical basis for the code, and a programmer's guide to the code. The ARCON95 code uses hourly meteorological data and recently developed methods for estimating dispersion in the vicinity of buildings to calculate relative concentrations at control room air intakes that would be exceeded no more five percent of the time. These concentrations are calculated for averaging periods ranging from one hour to 30 days in duration. Relative concentrations calculated by ARCON95 are significantly lower than concentrations calculated using the currently accepted procedure when winds are less than two meters per second. For higher wind speeds, ARCON95 calculates about the same concentrations as the current procedure.

21317 (SAND–94-2949) **Observations and insights from low power and shutdown studies: Grand Gulf Nuclear Power Plant during POS 5 of a refueling outage.** Whitehead, D.W.; Brown, T.D.; Forester, J.A. Sandia National Labs., Albuquerque, NM (United States). Apr 1995. 86p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95010578. Source: OSTI; NTIS; INIS; GPO Dep.

With the recent completion of the documentation of the results from the Grand Gulf Nuclear Power Plant Low Power and Shutdown (LP and S) project funded by the US Nuclear Regulatory Commission (NRC), detailed probabilistic risk assessment (PRA) information from a boiling water reactor (BWR) for a specific time period in LP and S conditions became available for examination. This report contains observations and insights extracted from an examination of: (1) results in the LP and S documentation; (2) the specific models and assumptions used in the LP and S analyses; (3) selected results from the full-power analysis; (4) the experience of the analysts who performed the original LP and S study; and (5) results from sensitivity calculations performed as part of this project to help determine the impact that model assumptions and data values had on the results from the original LP and S analysis. Specifically, this study makes observations on and develops insights from the estimates of core damage frequency and aggregate risk (early fatalities and total latent cancer fatalities) associated with operations during plant operational state (POS) 5 (i.e., basically cold shutdown as defined by Technical Specifications) during a refueling outage for traditional internal events. A discussion of similarities and differences between full power accidents and accidents during LP and S conditions is provided. As part of this discussion, core damage frequency and risks results are presented on a per hour and per calendar year basis, allowing alternative perspectives on both the core damage frequency and risk associated with these two operational states.

21318 (UCRL-CR–117769) **Strong motion duration and earthquake magnitude relationships.** Salmon, M.W. (EQE International, Inc., San Francisco, CA (United States)); Short, S.A.; Kennedy, R.P. Lawrence Livermore National Lab., CA (United States); EQE International, Inc., San Francisco, CA (United States); RPK Structural Mechanics Consulting, Yorba Linda, CA (United States). Jun 1992. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95010685. Source: OSTI; NTIS; INIS; GPO Dep.

Earthquake duration is the total time of ground shaking from the arrival of seismic waves until the return to ambient conditions. Much of this time is at relatively low shaking levels which have little effect on seismic structural response and on earthquake damage potential. As a result, a parameter termed "strong motion duration" has been defined by a number of investigators to be used for the

purpose of evaluating seismic response and assessing the potential for structural damage due to earthquakes. This report presents methods for determining strong motion duration and a time history envelope function appropriate for various evaluation purposes, for earthquake magnitude and distance, and for site soil properties. There are numerous definitions of strong motion duration. For most of these definitions, empirical studies have been completed which relate duration to earthquake magnitude and distance and to site soil properties. Each of these definitions recognizes that only the portion of an earthquake record which has sufficiently high acceleration amplitude, energy content, or some other parameters significantly affects seismic response. Studies have been performed which indicate that the portion of an earthquake record in which the power (average rate of energy input) is maximum correlates most closely with potential damage to stiff nuclear power plant structures. Hence, this report will concentrate on energy based strong motion duration definitions.

21319 (WSRC-MS–94-0356) **Buoyancy-driven flow excursions in fuel assemblies.** Laurinat, J.E.; Paul, P.K.; Menna, J.D. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950904–1: 7. international meeting on nuclear reactor thermal hydraulics, Saratoga, NY (United States), 10-15 Sep 1995). Order Number DE95004401. Source: OSTI; NTIS; INIS; GPO Dep.

A power limit criterion was developed for a postulated Loss of Pumping Accident (LOPA) in one of the recently shut down heavy water production reactors at the Savannah River Site. These reactors were cooled by recirculating moderator downward through channels in cylindrical fuel tubes. Powers were limited to prevent a flow excursion from occurring in one or more of these parallel channels. During full-power operation, limits prevented a boiling flow excursion from taking place. At low flow rates, during the addition of emergency cooling water, buoyant forces reverse the flow in one of the coolant channels before boiling occurs. As power increases beyond the point of flow reversal, the maximum wall temperature approaches the fluid saturation temperature, and a thermal excursion occurs. The power limit criterion for low flow rates was the onset of flow reversal. To determine conditions for flow reversal, tests were performed in a mock-up of a fuel assembly that contained two electrically heated concentric tubes surrounded by three flow channels. These tests were modeled using a finite difference thermal-hydraulic code. According to code calculations, flow reversed in the outer flow channel before the maximum wall temperature reached the local fluid saturation temperature. Thermal excursions occurred when the maximum wall temperature approximately equaled the saturation temperature. For a postulated LOPA, the flow reversal criterion for emergency cooling water addition was more limiting than the boiling excursion criterion for full power operation. This criterion limited powers to 37% of historical levels.

21320 (DOE/BP/27938–T1) **Analytical tools to predict distribution outage restoration load. Final project report.** Law, J. Idaho Univ., Moscow, ID (United States). Dept. of Electrical Engineering. 14 Nov 1994. 89p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95011461. Source: OSTI; NTIS; GPO Dep.

The main activity of this project has been twofold: (1) development of a computer model to predict CLPU(Cold Load Pickup) and (2) development of a field measurement and analysis method to obtain the input parameters of the CLPU model. The field measurement and analysis method is called the Step-Voltage-Test (STEPV). The Kootenai Electric Cooperative Appleway 51 feeder in Coeur d'Alene was selected for analysis in this project and STEPV tests were performed in winters of 92 and 93. The STEPV data was analyzed (method and results presented within this report) to obtain the Appleway 51 feeder parameters for prediction by the CLPU model. One only CLPU record was obtained in winter 1994. Unfortunately, the actual CLPU was not dramatic (short outage and moderate temperature) and did not display cyclic restoration current. A predicted Appleway 51 feeder CLPU was generated using the parameters obtained via the STEPV measurement/analysis/algorithm method at the same ambient temperature and outage duration as the measured actual CLPU. The predicted CLPU corresponds reasonably well with the single actual CLPU data obtained in winter 1994 on the Appleway 51 feeder.

21321 (DOE/OR/21999–T1) **Department of Energy refurbish power supply/distribution system: Phase 2, Y-12 Plant, Oak Ridge. Project status report No. 40, December 1–31, 1994.** Hayes, Seay, Mattern and Mattern, Roanoke, VA (United States). [1994]. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-91OR21999. Order Number DE95012196. Source: OSTI; NTIS; GPO Dep.

A status report on the refurbishing of the power supply and distribution system for the Y-12 Plant is presented. A milestone schedule is included.

2402 Power System Networks, Transmission and Distribution

21322 (CONF-9505196–2) **Reliability of lightning resistant overhead distribution lines.** Tolbert, L.M.; Cleveland, J.T.; Degenhardt, L.J. Oak Ridge National Lab., TN (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1995 industrial and commercial power systems conference; San Antonio, TX (United States); 8-10 May 1995. Order Number DE95008974. Source: OSTI; NTIS; GPO Dep.

An assessment of the 32 year historical reliability of the 13.8 kV electrical distribution system at the Oak Ridge National Laboratory (ORNL) in Tennessee has yielded several conclusions useful In the planning of Industrial power Systems. The system configuration at ORNL has essentially remained unchanged in the last 32 years which allows a meaningful comparison of reliability trends for the plant's eight overhead distribution lines, two of which were built in the 1960's with lightning resistant construction techniques. Meticulous records indicating the cause, duration, and location of 135 electric outages in the plant's distribution system have allowed a reliability assessment to be performed. The assessment clearly shows how differences in voltage construction class, length, age, and maximum elevation above a reference elevation influence the reliability of overhead power distribution lines. Comparisons are also made between the ORNL historical data and predicted failure rates from ANSI and IEEE industry surveys.

21323 (TKK-S/SLV–15) **Measurement methods for electric power systems.** Toivonen, L. World Energy Conference, Helsinki (Finland). Finnish National Committee. 1994. 63p. Order Number DE95779248. Source: OSTI; NTIS.

A wide area evaluation of the electric parameters of both the power network as well as of the electricity favours portable instrumentation for long-term field measurements. It is shown that an approach where signals are asynchronously sampled at a fixed rate and subsequently digitally processed, results in a versatile, uncomplicated construction of the instrument and in high accuracy. Besides the simplicity of implementation, asynchronously sampling is justified by the fact that the voltages and currents of the power system are not periodic in a strict sense since they contain stochastic components. The multirate processing in voltage, current and power measurement, and a uniform DFT analysis filter bank in spectrum analysis give high computational efficiency and well-defined pass and stop bands, and enable strict control of aliasing error. Data reduction and compression of the results cut down the memory demand and, thus, make it practical to construct a robust data storage using semiconductor memory chips. Due to speed and linearity constraints, some specific analogue processing circuitry is still necessary in the measurement of voltage impulses and a small dc component of an ac voltage, in order to achieve a

simple construction of hardware. Moreover, some specific design solutions such as a stable, differential input current shunt amplifier, and a dedicated floating point analogue-to-digital converter give high technical performance and lead to a straightforward realization in this application. (orig.)

2403 Power Transmission Lines and Cables

21324 (PNL–10561) **Transmission line capital costs.** Hughes, K.R.; Brown, D.R. Pacific Northwest Lab., Richland, WA (United States). May 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95012233. Source: OSTI; NTIS; INIS; GPO Dep.

The displacement or deferral of conventional AC transmission line installation is a key benefit associated with several technologies being developed with the support of the U.S. Department of Energy's Office of Energy Management (OEM). Previous benefits assessments conducted within OEM have been based on significantly different assumptions for the average cost per mile of AC transmission line. In response to this uncertainty, an investigation of transmission line capital cost data was initiated. The objective of this study was to develop a database for preparing preliminary estimates of transmission line costs. An extensive search of potential data sources identified databases maintained by the Bonneville Power Administration (BPA) and the Western Area Power Administration (WAPA) as superior sources of transmission line cost data. The BPA and WAPA data were adjusted to a common basis and combined together. The composite database covers voltage levels from 13.8 to 765 W, with cost estimates for a given voltage level varying depending on conductor size, tower material type, tower frame type, and number of circuits. Reported transmission line costs vary significantly, even for a given voltage level. This can usually be explained by variation in the design factors noted above and variation in environmental and land (right-of-way) costs, which are extremely site-specific. Cost estimates prepared from the composite database were compared to cost data collected by the Federal Energy Regulatory Commission (FERC) for investor-owned utilities from across the United States. The comparison was hampered because the only design specifications included with the FERC data were voltage level and line length. Working within this limitation, the FERC data were not found to differ significantly from the composite database. Therefore, the composite database was judged to be a reasonable proxy for estimating national average costs.

2405 Environmental Aspects

21325 (INIS-BR–3526) **Environmental impact of high voltage aerial transmission lines.** Silva, R.P. (CAEEB, Brasilia, DF (Brazil)); Mouallen, M.C.; Quintella, S.E.A. Companhia Paranaense de Energia (COPEL), Curitiba, PR (Brazil). 1989. 6p. (In Portuguese). (CONF-8910591–: 10. national seminar on production and transmission of electric power, Curitiba (Brazil), 1-5 Oct 1989). Order Number DE95633449. Source: OSTI; NTIS (US Sales Only); INIS.

The identification of environmental impacts caused by the aerial transmission lines and the measures for reducing these impacts are discussed, considering the impact over the soil in different areas, biological effects caused by delayed exposure and visual impacts due to the line structures. A methodology for the impact evaluation and the aspects of the Environmental Impact Studies and Environmental Impact Report are also studied. (C.G.C.). 2 refs, 1 fig.

2505 Flywheels

21326 (ANL/ET/CP–85212) **A permanent-magnet rotor for a high-temperature superconducting bearing.** Mulcahy, T.M. (Argonne National Lab., IL (United States)); Hull, J.R.; Uherka, K.L.; Abboud, R.G.; Wise, J.H.; Carnegie, D.W. Argonne National Lab., IL (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950691–1: 14. international conference on magnet technology, Tampere (Finland), 11-16 Jun 1995). Order Number DE95014230. Source: OSTI; NTIS; GPO Dep.

Design, fabrication, and performance, of a 1/3-m dia., 10-kg flywheel rotor with only one bearing is discussed. To achieve low-loss energy storage, the rotor's segmented-ring permanent-magnet (PM) is optimized for levitation and circumferential homogeneity. The magnet's carbon composite bands enable practical energy storage.

2506 Thermal

21327 (DTU-LV–95-08) **Investigation of the lid construction for hot water pond storage.** Duer, K. Danmarks Tekniske Univ., Lyngby (Denmark). Lab. for Varmeisolering. May 1995. 15p. (In Danish). Contract ENS-51181-94.0006. Order Number DE95779209. Source: OSTI; NTIS.

A floating lid covering the pond heat storage facility at the Ottrupgaard Solar Heating Plant has been tested in a period of 35 days. A 1.5 x 1.5 m section of the lid has been lowered into the experimental water tank, where the temperature was constant at 95 deg.C. After the 35 days test the lid section was weighed, dismounted and checked for traces of water penetration. The lid was waterproofed by means of silicone and polyurethane joints on its surfaces. At the post-testing inspection the vertical edge profiles consisting of stainless steel were found to slightly corroded and the corner construction untight. Corner joints in the future lid at the Ottrupgaard heat storage facility, according to the results of testing, should be reinforced by stainless steel. The elements used for lid construction should be sealed. Polyurethane should be injected in-situ in order to avoid water influx, however there may occur problems with keeping the top plate quite flat (EG)

2509 Batteries

21328 (ANL/CMT/CP–84744) **Sulfide ceramics in molten-salt electrolyte batteries.** Kaun, T.D.; Hash, M.C.; Simon, D.R. Argonne National Lab., IL (United States). [1995]. 19p. Sponsored by USDOE, Washington, DC (United States);Illinois State Government, Springfield, IL (United States). DOE Contract W-31109-ENG-38. (CONF-950401–8: 97. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 30 Apr - 1 may 1995). Order Number DE95013443. Source: OSTI; NTIS; GPO Dep.

Sulfide ceramics are finding application in the manufacture of advanced batteries with molten salt electrolyte. Use of these ceramics as a peripheral seal component has permitted development of bipolar Li/FeS_2 batteries. This bipolar battery has a molten lithium halide electrolyte and operates at 400 to 450C. Initial development and physical properties evaluations indicate the ability to form metal/ceramic bonded seal (13-cm ID) components for use in high-temperature corrosive environments. These sealants are generally $CaAl_2S_4$-based ceramics. Structural ceramics (composites with oxide or nitride fillers), highly wetting sealant formulations, and protective coatings are also being developed. Sulfide ceramics show great promise because of their relatively low melting point, high-temperature viscous flow, chemical stability, high-strength bonding, and tailored coefficients of thermal expansion. Our methodology of generating laminated metal/ceramic pellets (e.g., molybdenum/sulfide ceramic/molybdenum) with which to optimize materials formulation and seal processing is described.

21329 (ANL/CMT/CP–85522) **Materials issues in USABC-sponsored battery technologies.** Smaga, J.A. Argonne National Lab., IL (United States). 18 Jan 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38.

(CONF-950195–1: Capital metals and materials forum on electric vehicle battery technology prospects for materials and commercialization, Washington, DC (United States), 18 Jan 1995). Order Number DE95013393. Source: OSTI; NTIS; GPO Dep.

Battery goals for electric vehicles are doubled range and acceleration, performance, life, and total cost comparable to internal-combustion cars. Sponsored battery technologies face both technical and materials challenges to meet these goals. The materials issues for both the mid-term and long-term batteries are the focus of this paper. The expected demand for battery materials in the future is estimated.

21330 (CONF-941063–13) **Cathode limited charge transport and performance of thin-film rechargeable lithium batteries.** Bates, J.B.; Hart, F.X.; Lubben, D.; Kwak, B.S.; van Zomeren, A. Oak Ridge National Lab., TN (United States). Nov 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 186. meeting of the Electrochemical Society; Miami, FL (United States); 9-14 Oct 1994. Order Number DE95008977. Source: OSTI; NTIS; GPO Dep.

Several types of thin-film rechargeable batteries based on lithium metal anodes and amorphous V_2O_5 (aV_2O_5), $LiMn_2O_4$, and $LiCoO_2$ cathodes have been investigated in this laboratory. In all cases, the current density of these cells is limited by lithium ion transport in the cathodes. This paper, discusses sources of this impedance in Li-aV_2O_5 and Li-$LiMn_2O_4$ thin-film cells and their effect on cell performance.

21331 (CONF-9410309–4) **Thin-film rechargeable lithium batteries.** Dudney, N.J.; Bates, J.B.; Lubben, D. Oak Ridge National Lab., TN (United States). Nov 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Contractor's coordination meeting; Dearborn, MI (United States); 24-27 Oct 1994. Order Number DE95008975. Source: OSTI; NTIS; GPO Dep.

Small thin-film rechargeable cells have been fabricated with a lithium phosphorus oxyniuide electrolyte, Li metal anode, and $Li_{1-x}Mn_2O_4$ as the cathode film. The cathode films were fabricated by several different techniques resulting in both crystalline and amorphous films. These were compared by observing the cell discharge behavior. Estimates have been made for the scale-up of such a thin-film battery to meet the specifications for the electric vehicle application. The specific energy, energy density, and cycle life are expected to meet the USABC mid-term criteria. However, the areas of the thin-films needed to fabricate such a cell are very large. The required areas could be greatly reduced by operating the battery at temperatures near 100°C or by enhancing the lithium ion transport rate in the cathode material.

21332 (LBL–35809) **Polymeric electrolytes for ambient temperature lithium batteries. Final report.** Farrington, G.C. (Pennsylvania Univ., Philadelphia, PA (United States). Dept. of Materials Science and Engineering). Lawrence Berkeley Lab., CA (United States). Jun 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95012756. Source: OSTI; NTIS; GPO Dep.

Samples of a plasticized Li^+ polymer electrolyte having high conductivity at room temperature were prepared with mixed plasticizer compositions of ethylene carbonate (EC) and propylene carbonate (PC). The influence of EC:PC in varying proportions with 1M $LiAsF_6$ as the dissolved salt on the chemical and electrochemical properties of the electrolyte was studied. Electrolytes with mixed EC:PC compositions were found to have greater thermal stability, improved lithium and cathode (V_6O_{13}) interfacial properties, and superior mechanical properties compared to those prepared with pure EC and PC. The results of this work are relevant to possible uses of such electrolytes in energy storage technologies.

21333 (LBL–37071) **Electrochemical characterization of orthorhomobic Na_xMnO_2 for alkali metal polymer batteries.** Doeff, M.M.; Ding, Lie; DeJonghe, L.C. Lawrence Berkeley Lab., CA (United States). Apr 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-950412–11: Spring meeting of the Materials Research Society (MRS), San Francisco, CA (United States), 17-21 Apr 1995). Order Number DE95012369. Source: OSTI; NTIS; GPO Dep.

Electrochemical potential spectroscopy (ECPS) has been used successfully to observe and explain ordering transitions in orthorhombic Na_xMnO_2 as it is discharged in a sodium/polymer cell. Features can be assigned on the basis of sequential filling of sites in the small and then the large tunnels of the structure as the reduction progresses. Intercalation of lithium into Na_xMnO_2 may be less straightforward than that of sodium, and is worthy of investigation by ECPS. Li/Na_xMnO_2 cells have a greater discharge capacity than Na/Na_xMnO_2 cells, suggesting that more than four lithiums per large tunnel can be inserted. (It is also possible, but less likely that more than one lithium can be placed inside the small tunnels). This implies that the sites for lithium occupancy might be somewhat different than that for sodium. Further investigation into the properties of orthorhombic Na_xMnO_2 and its utility as a positive electrode for rechargeable sodium and lithium cells is presently underway in this laboratory.

21334 (NREL/TP–473-7783) **Thermal management of batteries using a Variable-Conductance Insulation (VCI) enclosure.** Burch, S.D.; Parish, R.C.; Keyser, M.A. National Renewable Energy Lab., Golden, CO (United States). May 1995. 6p. Sponsored by USDOE, Washington, DC (United States);United States Advanced Battery Consortium (United States). DOE Contract AC36-83CH10093. (CONF-950729–5: 30. Intersociety energy conversion conference, Orlando, FL (United States), 30 Jul - 5 aug 1995). Order Number DE95009207. Source: OSTI; NTIS; GPO Dep.

Proper thermal management is important for optimum performance and durability of most electric-vehicle batteries. For high-temperature cells such as sodium/sulphur, a very efficient and responsive thermal control system is essential. Heat must be removed during exothermic periods and retained when the batteries are not in use. Current thermal management approaches rely on passive insulation enclosures with active cooling loops that penetrate the enclosure. This paper presents the design, analysis, and testing of an enclosure with variable conductance insulation (VCI). VCI uses a hydride with an integral electric resistance heater to expel and retrieve a small amount of hydrogen gas into a vacuum space. By controlling the amount of hydrogen gas, the thermal conductance can be varied by more than 100:1, enabling the cooling loop (cold plate) to be mounted on the enclosure exterior. By not penetrating the battery enclosure, the cooling system is simpler and more reliable. Also, heat can be retained more effectively when desired. For high temperatures, radiation shields within the vacuum space are required. Ceramic spacers are used to maintain separation of the steel enclosure materials against atmospheric loading. Ceramic-to-ceramic thermal contact resistance within the spacer assembly minimizes thermal conductance. Two full-scale (0.8-m x 0.9-m x 0.3-m) prototypes were designed, built, and tested under high-temperature 200°-350°C battery conditions. With an internal temperature of 330°C (and 20°C ambient), the measured total-enclosure minimum heat loss was 80 watts (excluding wire pass-through losses). The maximum heat rejection was 4100 watts. The insulation can be switched from minimum to maximum conductance (hydrogen pressure from 2.0×10^{-3} to 8 torr) in 3 minutes. Switching from maximum to minimum conductance was longer (16 minutes), but still satisfactory because of the large thermal mass of the battery.

21335 (SAND–95-0671) **Design rules and reality check for carbon-based ultracapacitors.** Eisenmann, E.T. Sandia National Labs., Albuquerque, NM (United States). Apr 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95010575. Source: OSTI; NTIS; GPO Dep.

Design criteria for carbon-based Ultracapacitors have been determined for specified energy and power requirements, using the geometry of the components and such material properties as density, porosity and conductivity as parameters, while also considering chemical compatibility. This analysis shows that the weights of active and inactive components of the capacitor structure must be carefully balanced for maximum energy and power density. When applied to nonaqueous electrolytes, the design rules for a 5 Wh/kg device call for porous carbon with a specific capacitance of about 30 F/cm^3. This performance is not achievable with pure, electrostatic double layer capacitance. Double layer capacitance is only 5

to 30% of that observed in aqueous electrolyte. Tests also showed that nonaqeous elcctrolytes have a diminished capability to access micropores in activated carbon, in one case yielding a capacitance of less than 1 F/cm^3 for carbon that had 100 F/cm^3 in aqueous electrolyte. With negative results on nonaqueous electrolytes dominating the present study, the obvious conclusion is to concentrate on aqueous systems. Only aqueous double layer capacitors offer adequate electrostatic charging characteristics which is the basis for high power performance. There arc many opportunities for further advancing aqueous double layer capacitors, one being the use of highly activated carbon films, as opposed to powders, fibers and foams. While the manufacture of carbon films is still costly, and while the energy and power density of the resulting devices may not meet the optimistic goals that have been proposed, this technology could produce true double layer capacitors with significantly improved performance and large commercial potential.

29 ENERGY PLANNING AND POLICY

21336 (ETDE-DE–126) **Chances and risks for the future world energy supply. Corporate initiatives facing governmental regimentation.** Rheinisch-Westfaelisches Elektrizitaetswerk AG, Essen (Germany). Energiewirtschaftlicher Arbeitskreis. May 1993. 43p. (In German). Order Number DE95780191. Source: OSTI; NTIS (US Sales Only).

Sufficient energy supply is indispensable for global development. It must be embedded in a precautionary policy for the protection of the world climate. All available energy sources must be drawn on and the technologies devised for their utilisation improved if the global energy demand is to be satisfied. For just this reason it is ecologically and economically unjustified to put a ban on certain fossil fuels or on nuclear energy in the industrialised countries. All CO_2-free energy sources, notably nuclear energy and renewable energies, will in the long run have to make a considerably larger contribution to the world energy supply than they have until now. The paper describes the energy-economical prospects for a future in which energy supply does not preclude environment consideration and resources preservation. (orig./UA)

21337 (ETDE/JP-mf–95787263) **Energy economics statistics, 1994 (domestic statistics).** Institute of Energy Economics, Tokyo (Japan). 10 Feb 1995. 77p. (In Japanese). Order Number DE95787263. Source: OSTI; NTIS; Available from The Institute of Energy Economics, Dai 10 Mori Biru, 18-1, Toranomon 1-chome, Minato-ku, Tokyo, Japan.

Institute of Energy Economics, Japan has issued the 1994 energy economic statistical data, covering the domestic energy basic data in the 1989-1993 period. These data are divided into 7 categories, general energy, oil, coal, gas, LPG, LNG and electric power. The price data cover the average CIF's of individual imported energy sources, oil product prices, unit prices of power supplied by public utilities, trends of consumer price indexes by individual energy sources, and trends of relative prices of energy sources for residential purposes (Tokyo). The economic, industrial and other statistics cover the major economic indexes, trends of investments by energy industries (oil, gas and power), trends of production and consumption of major energy consumers (steel, aluminum, paper/pulp, ceramics, soil/stone, and naphtha-consuming chemical industries). The business/residential data cover trends of energy consumption for business and residential purposes, and the transportation data cover the trends of number of cars, number of passengers by transportation sectors, cargo quantities, and energy consumption by transportation sectors.

21338 (CRIE-Y–94002) **Survey of the basic literature on energy economics.** Murota, Y. (Central Research Institute of Electric Power Industry, Tokyo (Japan)); Yamamoto, H.; Nagata, Y.; Matsukawa, I.; Nagano, K.; Watanabe, N.; Suzuki, T.; Hondo, Y.; Iwano, Y.; Sugiyama, H.; Yamaji, K. Central Research Inst. of Electric Power Industry, Tokyo (Japan). Jul 1994. 121p. (In Japanese). Order Number DE95787251. Source: OSTI; NTIS; Available from Central Research Institute of Electric Power Industry, 1-6-1, Otemachi, Chiyoda-ku, Tokyo, Japan.

The literature on energy economics is classified into demand, supply, and macro economics, and significance and characteristics of the analysis are described. The energy demand analysis is conducted mainly on effects of income and price. Effects of income are analyzed with GDP flexibility as indices, and GDP flexibility of developing countries is to approach gradually to 1 on the long term basis. However, there remains a question because there is a possibility of energy substituting for capital and labor. As to energy supply and demand, determination of the oil price is important, and the hotelling rule is a pioneer achievement in theoretical researches. The rule points out that the price gradually increases on a long term basis, according to reduction in reserve. With the oil crisis as a turning point, a discussion has become vigorous on effects of energy price on macro economics, and a large scale model analysis is carried out which handles correlation of energy economics. Further, using this model, an analysis is made on an effect of surcharge imposed as CO2 control measures. 121 refs., 27 figs., 23 tabs.

21339 (DOE/CE/90043–T2) **DOE/Project SEED student scholars partnership. Final report, June 7, 1994–April 27, 1995.** American Chemical Society, Washington, DC (United States). 13 Jun 1995. 81p. Project SEED is an innovative career development activity administered by ACS for economically disadvantaged high school students. SEED students spend 10 weeks during the summer in an academic, industrial, or governmental research laboratory working under the supervision of a researcher. Intent is to attempt to overcome obstacles which have excluded the economically disadvantaged from professional careers. Students are required to prepare a technical summary, give presentations to their sponsoring groups, and design and display a poster session. Each student also completed a pre- and post-program survey.

21340 (DOE/ER/75993–1) **1994 New England Regional Science Bowl [held at] Massachusetts Institute of Technology, February 26, 1994.** USDOE, Washington, DC (United States); Massachusetts Inst. of Tech., Cambridge, MA (United States). This report deals with the 1994 New England Regional Science Bowl, being held at the Massachusetts Institute of Technology.

21341 (LBL-PUB–3274-Rev.(1995)) **Lawrence Berkeley Laboratory Affirmative Action Program. Revised.** Lawrence Berkeley Lab., CA (United States). [1995]. 144p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95012378. Source: OSTI; NTIS; GPO Dep.

The Lawrence Berkeley Laboratory's Affirmative Action Program (AAP) serves as a working document that describes current policies, practices, and results in the area of affirmative action. It represents the Laboratory's framework for an affirmative approach to increasing the representation of people of color and women in segments of our work force where they have been underrepresented and taking action to increase the employment of persons with disabilities and special disabled and Vietnam era veterans. The AAP describes the hierarchy of responsibility for Laboratory affirmative action, the mechanisms that exist for full Laboratory participation in the AAP, the policies and procedures governing recruitment at all levels, the Laboratory's plan for monitoring, reporting, and evaluating affirmative action progress, and a description of special affirmative action programs and plans the Laboratory has

used and will use in its efforts to increase the representation and retention of groups historically underrepresented in our work force.

21342 (NEI-DK–2009) **Energy and environment in Argentina. Past and prospective evolution.** Working Paper, 1. Hasson, G.D. de; Suarez, C.E.; Pistonesi, H. United Nations Environment Programme, Roskilde (Denmark). Collaborating Centre on Energy and Environment. Apr 1995. 179p. Order Number DE95779216. Source: OSTI; NTIS.

Future perspectives for Argentina's energy system and its main environmental impacts are discussed with special emphasis on the impact on air emission. The aim is to focus on the probable environmental consequences of deep changes in the organization and regulation of the country's energy systems. The Argentinian government has launched a process of economical reconstruction and committed itself to privatization of all activities previously in the hands of public agencies. The development of the energy system during the last twenty years is analysed in addition to the energy trajectory and its main environmental impacts, and policies applied during that period are discussed. Future energy development and its consequent environmental impacts will be strongly influenced by the domestic and international economic context and by the strategies of the new energy operators. A pessimistic scenario, based on the assumption of an unfavourable economic development, and an optimistic scenario, are analysed and compared. It is concluded that policies aimed at moderating air emission from the energy system should consider both the opportunities of incorporating new technologies in end-use energy consumption and the strategies adopted for energy supply. The lack of definite policies regarding supply may offset efforts made at end-use energy consumption level. International reform proposals stress the need to decrease State intervention and allow the free interaction of private investors within the framework of competitive and deregulated energy markets. Energy restructuring proposals seem to contradict the concern for environmental protection. (AB) (31 refs.)

21344 (NEI-DK–2027, pp. 363-373) **Empirical investigation of economic conditions effect upon freight transport and its distribution into various transport-means.** Jensen, T.C. (AKF (Denmark)). Transportraadet, Copenhagen (Denmark); Aalborg Univ. (Denmark). Trafikforskningsgruppen. 1994. (In Danish). (CONF-9408240–Vol.2: Conference on traffic days at AUC, Aalborg (Denmark), 29-30 Aug 1994). In *Traffic days at AUC. Conference report vol. 2.* 282p. Order Number DE95787805. Source: OSTI; NTIS; INIS.

The purpose of this project is to elucidate whether freight transport can be organized more efficiently by changing shifting transportation means. Effect of changes in pricing of different transport forms is investigated. Sensitivity to transportation prices depends on supply and demand by the Danish industry and business. (EG)

21345 (SAND–94-2686) **Historical and projected costs of natural disasters.** Engi, D. Sandia National Labs., Albuquerque, NM (United States). Apr 1995. 58p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95013875. Source: OSTI; NTIS; GPO Dep.

Natural disasters cause billions of dollars of damage and thousands Of deaths globally each year. While the magnitude is clear, the exact costs (in damage and fatalities) are difficult to clearly identify. This document reports on the results of a survey of data on the costs associated with significant natural disasters. There is an impressive amount of work and effort going into natural disaster research, mitigation, and relief. However, despite this effort, there are surprisingly few consistent and reliable data available regarding the effects of natural disasters. Even lacking consistent and complete data, it is clear that the damage and fatalities from natural disasters are increasing, both in the United States, and globally. Projections using the available data suggest that, in the United States alone, the costs of natural disasters between 1995 and 2010 will be in the range of $90 billion (94$) and 5000 lives.

The United States Air Force's Environmental Compliance Assessment and Management Program (ECAMP) is a process to improve Air Force environmental compliance, management, and programmatic support. Midway into the third round of Command-initiated (external) ECAMP evaluations for its fourteen Air Logistics and Systems Centers, the Air Force Material Command (AFMC) is continuing to identify the root causes of instances of environmental noncompliance. The AFMC initiated an analysis of all negative findings identified during the second round of external ECAMP evaluations (June 1991 to January 1993). Presented here is a summary of the analysis with emphasis on trends and root causes.

Industrialization in developing countries is causing increasing environmental damage. Pollution prevention (P2) is an emerging environmental concept that could help developing countries achieve leapfrog goals, bypassing old and pollutive technologies and minimizing traditional control practices. The current P2 promotion activities in Hong Kong, the Republic of Korea, the Philippines, Singapore, Taiwan, and Thailand are discussed. These programs, generally initiated in the last 5 years, are classified into five categories: awareness promotion, education and training, information transfer, technical assistance, and financial incentives. All important at the early stages of P2 promotion, these programs should inform industries of the benefits of P2 and help them identify applicable P2 measures. Participation in these programs is voluntary. The limited data indicate that adoption of P2 measures in these countries is not yet widespread. Recommendations for expanding P2 promotion activities include (1) strengthening the design and enforcement of environmental regulations; (2) providing P2 training and education to government workers, nongovernmental organizations and labor unions officials, university faculties, and news media; (3) tracking the progress of P2 programs; (4) implementing selected P2 mandatory measures; (5) identifying cleaner production technologies for use in new facilities; (6) implementing special programs for small and medium enterprises; and (7) expanding P2 promotion to other sectors, such as agriculture and transportation, and encouraging green design and green consumerism.

21348 (CEA-CONF–11970) **Nuclear energy in France: assessing its impacts on the economy and the environment.** Charmant, A.; Devezeaux de Lavergne, J.G.; Ladoux, N.; Vielle, M. CEA, 75 - Paris (France). 1994. 14p. (CONF-940631–: 34. annual conference of the Canadian Nuclear Association; 15. annual conference of the Canadian Nuclear Society, Montreal (Canada), 5-8

Jun 1994). Order Number DE95631167. Source: OSTI; NTIS (US Sales Only); INIS.

As environmental matters become the focus of increasing concern, the implementation of major nuclear power programme has allowed France to enjoy the benefits of a comfortable position. Emissions of carbon dioxide per head in France are among the lowest in the industrialized world. On a worldwide level, Atomic Energy Commission forecasts have shown that the impact of the resumption of nuclear power programmes on the greenhouse effect would be limited. Nuclear power might have a useful role to play in the achievement of a more realistic reduction of these emissions.

With lessons learned through the initial assessment of energy technologies and with a new vision outlined in DOE's new strategic plan, the Office of Policy determined that assessment of R&D activities should extend beyond energy technologies and consider all DOE technology R&D programs, including environmental and dual-benefit defense programs. Of particular importance is the consideration of how well environmental technology R&D activities support the paradigm shift toward sustainable development. Sustainable development, defined in the Clinton Administration's Report titled Technology for a Sustainable Future as "development that meets the needs of the present without compromising the ability of future generations to meet their own needs," is dependent on effective environmental technologies. The importance of environmental technologies is echoed in DOE's Strategic Plan in which one specific goal is stated as: "By the Year 2005, [DOE will] be a leading Federal Agency in environmental technology development focused on the Nation's needs."

21350 (DMI-SR–94-5) **The contribution of the Danish Meteorological Institute (DMI) to the EPOCH project 'The climate of the 21. century'.** Hesselbjerg Christensen, J.; Kaas, E.; Laursen, L. Danish Meteorological Inst., Copenhagen (Denmark). 1994. 72p. Order Number DE95779207. Source: OSTI; NTIS.

The main task of the Climate of the 21st Century project was formulated as an application of well established groups, running verified Atmospheric and Ocean General Circulation Models (A-GCMs and O-GCMs) to investigate anthropogenic climate change and natural climate variability. The sup-projects in the category jointed by the Danish Meteorological Institute (DMI) were: Short term climate variability, AGCM equilibrium climate response simulations and parameterizations, model intercomparison and validation and regional climate simulations with nested models. The latter aims at matching more detailed simulations of climate in regions such as Europe by utilizing techniques known from numerical weather forecasting over a limited domain. It was demonstrated that the models at DMI have some deficits in simulating the natural variability of the present climate in terms of blocking frequency and representation of persistent anomalies. It was found that the release version of Arpege, as used at DMI, does not seem to have been an improvement. It was demonstrated that the actual origin of an external climate forcing mechanism may have very similar consequences, in terms of (e.g.) pattern of temperature change, it being a doubling of CO_2 or a 1-2% increase in the solar constant. Results on climatic impact of stratospheric ozone depletion were inconclusive, except in revealing the need for a more up-to-date climate model at DMI. The main conclusion of the feasibility study is that it seems a realistic approach to adopt the nesting technique for the downscaling of GCM simulations. (AB) (33 refs.)

21351 (DOE/EH–0484) **Reference manual for toxicity and exposure assessment and risk characterization. CERCLA Baseline Risk Assessment.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). RCRA/CERCLA Div. Mar 1995. 170p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI (Free of Charge); INIS; Center for Environmental Management Information, 1-800-736-3282.

The Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA, 1980) (CERCLA or Superfund) was enacted to provide a program for identifying and responding to releases of hazardous substances into the environment. The Superfund Amendments and Reauthorization Act (SARA, 1986) was enacted to strengthen CERCLA by requiring that site clean-ups be permanent, and that they use treatments that significantly reduce the volume, toxicity, or mobility of hazardous pollutants. The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) (USEPA, 1985; USEPA, 1990) implements the CERCLA statute, presenting a process for (1) identifying and prioritizing sites requiring remediation and (2) assessing the extent of remedial action required at each site. The process includes performing two studies: a Remedial Investigation (RI) to evaluate the nature, extent, and expected consequences of site contamination, and a Feasibility Study (FS) to select an appropriate remedial alternative adequate to reduce such risks to acceptable levels. An integral part of the RI is the evaluation of human health risks posed by hazardous substance releases. This risk evaluation serves a number of purposes within the overall context of the RI/FS process, the most essential of which is to provide an understanding of "baseline" risks posed by a given site. Baseline risks are those risks that would exist if no remediation or institutional controls are applied at a site. This document was written to (1) guide risk assessors through the process of interpreting EPA BRA policy and (2) help risk assessors to discuss EPA policy with regulators, decision makers, and stakeholders as it relates to conditions at a particular DOE site.

21352 (DOE/EIS–0215-ROD) **Record of Decision: Pinon Pine Power Project, Tracy Station, Nevada.** Wachter, J.K. USDOE Morgantown Energy Technology Center, WV (United States). Program Support Div. 8 Nov 1994. 39p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95009934. Source: OSTI; NTIS; GPO Dep.

The Department of Energy (Department) has decided to provide approximately $135 million in cost-shared Federal funding as part of the Clean Coal Technology Demonstration Program for the design, construction, and operation of the Pinon Pine Power Project. It would demonstrate integrated gasification combined-cycle technology with hot gas clean-up at the Sierra Pacific Power Company's (Sierra Pacific) Tracy Power Station near Reno, Nevada. Following careful evaluation of the potential environmental impacts, consideration of Clean Coal Technology Demonstration Program goals and objectives, review and analysis of public comments, and consultation with Federal and state agencies and Indian tribal representatives, the Department issued the Final Environmental Impact Statement for the Pinon Power Project. The project is expected to generate sufficient data from design, construction, and operation, to allow private industry to further assess the potential for commercial application of this technology to new or existing generating facilities. No unacceptable adverse impacts are expected from the construction or operation of the Pinon Pine Power Project. This report describes potential environmental impacts and mitigation measures.

21353 (DOE/ID–10478-UGF) **A User's Guide to the SNF & INEL EIS.** USDOE Idaho Operations Office, Idaho Falls, ID (United States). [1995]. 35p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012050. Source: OSTI; NTIS; INIS; GPO Dep.

This User's Guide is intended to help you find information in the SNF and INEL EIS (that's short for US Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Final Environmental Impact Statement). The first section of this Guide gives you a brief overview of the SNF & INEL EIS., The second section is organized to help you find specific information in the Environmental Impact Statement – whether you're interested in a management alternative, a particular site (such as Hanford), or a discipline (such as land use or water quality).

21354 (DOE/NV/11432–171) **Untitled article pollution prevention advisor.** Schoppman, J.W. Reynolds Electrical and

Engineering Co., Inc., Las Vegas, NV (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-94NV11432. Order Number DE95011300. Source: OSTI; NTIS; GPO Dep.

Tests to characterize the material in drums containing crushed fluorescent lighting tubes at the Nevada Test Site were conducted and a determination was made that the drums contain no hazardous materials.

21355 (ETDE-DE--116) **Law on the avoidance of residues, utilization of raw materials, and disposal of wastes.** Zur Sache. Themen parlamentarischer Beratung, v. 6/94. Deutscher Bundestag, Bonn (Germany). Referat Oeffentlichkeitsarbeit. 1994. 1054p. (In German). Order Number DE95780042. Source: OSTI; NTIS (US Sales Only).

The present paper documents the legislative procedure for the law on Materials Recycling and Waste Management (KrW-/AbfG). The Mediation Committee's recommendation in favour of the law found the Bundestag's unanimous approval on 26 June 1994. The approval of the Bundesrat followed on 8 July 1994. The law was promulgated on 6 October 1994 and is to take effect two years after this date. The purpose of the law is to encourage materials recycling and so help conserve natural resources and secure the environmentally acceptable disposal of materials. Its regulations apply to the avoidance, utilisation, and disposal of wastes. (orig.)

Environmental protection in the alpine region is mostly based on a healthy mountain forest which protects roads, settlements and agricultural areas. Environmental policies are therefore aimed mostly at early diagnosis of now damage and increased ecological orientation of traditional forest utilisation such as forestry, hunting, forest pasturing and also tries to reduce the different kinds of emmissions which affect the forest ecosystem. Scientific findings can provide help for all these tasks provided politicians are able to use scientific findings in without modifying them. In practical terms this very rarely happens on the area of forest protection policies. This analysis shows some of the main information barriers and tries to establish forest information strategies in order to make topical scientific findings an integral part of forest protections. (orig./EW)

21357 (GSF-39/93, pp. 374-381) **The contribution of environmental protection- and forest protection laws on reduction of forest soil pollution in Switzerland.** Gottesmann, J. Deposition of pollutants pollute forest ecosystems just like most direct or indirect influences of humankind. Proper control is therefore necessary to attenuate or reduce their effects. Creating a proper forest ecosystem management schemes, however, encounters a great deal of obstacles as soon as this concept is defined as a holistic control instrument for all anthropogenically influence processes in a forest. One must also take into account that not all of the complex feedback mechanisms which influence storage, autoregulation and elasticity of the complex forest ecosystems are known today. If the ecosystem management is viewed predominantly as a reflection of the changing relationship between forest and society it may produce promising ideas for a concept of conflict-solving which combines the various demands of society with the demands of a forest ecosystem. 21360 (INIS-mf-15114) **Potentials for energy saving and CO_2 reduction in Baden-Wuerttemberg. Status report.** Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg. Arbeitsberichte, v. 1. Weimer, W.; Luenstroth, U. Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg, Stuttgart (Germany). Dec 1993. 84p. (In German). Order Number DE95785377. Source: OSTI; NTIS (US Sales Only); INIS.

In order to protect the climate the Administration of the state of Baden-Wuerttemberg aims at cutting energy-related CO_2-emissions by 30% by the year 2005. This study analyses the potentials of energy consumption and CO_2-reduction in the state of Baden-Wuerttemberg in the framework of an evaluation of literature. As special emphasis is put on technical steps such as an increase in efficiency with respect to the generation and consumption of energy as well as on the substitution of fossil energy sources by regenerative techniques of energy generation. In order to obtain considerable potentials of energy-saving a moderate increase in

energy prices as well as several actions to reduce impediments are required . However, an achievement of those goals by the year 2005 is only partly possible, because of the time required. The evaluation of literature serves as a preparation of the comprehensive project Klimavertraegliche Energieversorgung in Baden-Wuerttemberg (greenhouse-gas-reduced energy supply in Baden-Wuerttemberg) of the Center of Technology Assessment in Baden-Wuerttemberg. (orig.)

21361 (NEDO-GET–9310-2) **Promotion project to develop the global environment related industrial technology. Investigation on the possibility of research exchange.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1994. 142p. (In Japanese). Order Number DE95786802. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

Through visits to US universities and research institutes, investigation was made on the trend of global environment-related research and possibility of their exchanging the result of research with the RITE (Research Institute of Innovative Technology for the Earth). To investigate the process technology to utilize microbes harmoniously with the environment, the visit was paid to Cornell University, Battelle Memorial Institute and Risk Reduction Engineering Laboratory, where the investigation was made on the environmental bioremediation with microbial functions and clean process production without by-producing substances to load the environment. To investigate the technical measures against the global warming, the visit was paid to Brookhaven National Laboratory, Massachusetts Institute of Technology, California University, Hawaii University and Pacific International Center for High Technology Research, where the investigation was made, through discussion and exchange of research information and opinion with researchers and engineers, on the possibility of their exchanging the result of research with the RITE. Judging from the investigation of this time, the research which is mutually complementary between Japan and USA is easy to promote, because their respective advanced fields do not overlap with each other. 88 refs., 11 figs., 6 tabs.

21364 (NILU-F–4/94) **Unsolved international environmental problems and their influence in Norway.** Dovland, H. Norsk Inst. for Luftforskning, Kjeller (Norway). Mar 1994. 10p. (In Norwegian). Order Number DE95779282. Source: OSTI; NTIS.

The publication deals with global pollution problems and their influence in Norway. The need of sustainable development to solve these problems is discussed. The attention is laid on the most threatening types of air pollutants in an European and global scale with the primary emphasis on acidification, photochemical oxidants, degradation of ozone layer, and possible climatic changes caused by the greenhouse effect. Causal relations to each of these problems together with the status of international cooperation and the possibilities of future solution, are briefly described.

21365 (NILU-F–9/94) **The case of transboundary air pollution.** Dovland, H. Norsk Inst. for Luftforskning, Kjeller (Norway). May 1994. 6p. (CONF-9404267–1: OECD workshop on trade and environment: PPMs issues, Helsinki (Finland), 6-7 Apr 1994). Order Number DE95779281. Source: OSTI; NTIS.

The publication deals with transboundary air pollution. Topics are: Critical loads approach; elements of the protocol on further reductions of sulphur emissions. To use the critical loads approach, the information to be needed is such as inventories of current emissions and projections of future emissions, estimates of potential for and costs of emission reductions, long-range transport models describing in quantitative terms the transport of air pollutants within regions, maps of critical loads, and integrated assessment models in which the above elements are combined to assess alternative reduction strategies. The long term goal given in the protocol is to ensure that sulphur deposition do not exceed critical loads. Examples are given. In Germany, the additional costs of sulphur abatement from electricity generation is 1.5 pfennig/kWh.

21366 (NILU-OR–17/94) **Long-range transported pollutants. Supplies, effects and critical loads.** Floeisand, I.; Johannessen, T. (eds.). Norsk Inst. for Luftforskning, Kjeller (Norway). Mar 1994. 210p. (In Norwegian, English). (CONF-9403229–: Long-range transported pollutants. Supplies, effects and critical loads, Grimstad (Norway), 7-9 Mar 1994). Order Number DE95779285. Source: OSTI; NTIS.

The report consists of a collection of papers dealing with the effects and the critical load of air-borne pollutants in Norway. The papers from this meeting are based on the status of knowledge and the research requirement experienced from two Norwegian research programs covering the supplies and effects of long-range transported pollutants together with the critical load to nature. Seven themes are covered such as air, water chemistry, water biology, soil, forest, plants and animals. Three papers from the meeting are prepared. 312 refs., 76 figs., 26 tabs.

21367 (NILU-OR–21/94) **Short-time study of the connection between air pollution and health effects in Grenland. Effects of air pollution on the humans' understanding of their own health.** Clench-Aas, J. (Norsk Inst. for Luftforskning, Kjeller (Norway)); Bartonova, A.; Aarnes, M.J.; Bjerknes-Haugen, G.; Samuelsen, S.O.; Bakketeig, L.S.; Hjort, N.L.; Halvorsen, K. Norsk Inst. for Luftforskning, Kjeller (Norway); Statens Inst. for Folkehelse, Oslo (Norway). Apr 1994. 201p. (In Norwegian). Order Number DE95779279. Source: OSTI; NTIS.

The air in Grenland (an industrialized area in southern Norway) contains various pollutants such as sulfur dioxide, nitrogen dioxide, ozone, hydrocarbons and particles including acid aerosols. These originate from industry, traffic and domestic heating. The sources of emissions lie at the valley bottom. Air pollutants are also transported into the region from sources outside the area, e.g. due to long-range transport. Even though subjective symptom reporting does not necessarily indicate a major health effect, it should reflect a general state of well-being which is of importance to take into account in assessing the impact of air pollutants. Therefore, both symptom reporting and objective measurements of lung function were included in the investigation. The Grenland study began in the spring of 1987 and has been a cooperative project between the Norwegian Institute for Air Research and the National Institute of Public Health. The aim of the study was to investigate whether air pollutants either individually or in combination had short-term effects on health and well-being of people living in the Grenland area. 56 refs., 55 figs., 17 tabs.

21368 (NRRI–93-8, pp. 65-72) **Acid rain compliance: The need for regulatory guidance.** Solomon, B.D. (Environmental Protection Agency, Washington, DC (United States)). National Regulatory Research Inst., Columbus, OH (United States). Jul 1993. Order Number DE95008741. Source: OSTI; NTIS; GPO Dep.

Utility acid rain compliance plans have begun to roll into public utility commissions around the eastern half of the country. These plans typically represent the combined effort of utility staff and consultants, and have evolved since early drafts of Title IV of the Clean Air Act Amendments of 1990 (CAAA) began to circulate, several years back. The filings themselves often consist of many volumes of technical analysis, supporting documentation, and accompanying testimony. Hundreds of computer simulations are often presented and these, in turn, are underlain by hundreds of assumptions covering a staggering range of variables. Commissions usually have little time and few external resources with which to review and in some cases, preapprove proposed utility actions. There may be a tendency among commissions to forego a comprehensive review, approve utility plans as filed, and hope for the best. There are at least three important reasons, however, why this should not occur: (1) The magnitude of planned CAAA expenditures is large. (2) Preapproval, either formal or de facto, is becoming increasingly common. Although the approval of specific actions is certainly one outcome of the preapproval process, it should not be the sole or even principal outcome. The main focus of preapproval should involve defining an economic and institutional framework for how utilities, with input from regulators and the public, can best meet future customer needs. Done correctly, the preapproval process provides a meaningful, preexisting context which can be used to analyze outcomes. (3) Without adequate review market opportunities may be ignored and compliance costs increased unnecessarily. This article discusses the following topics in detail: CAAA Compliance Plan Review framework; Emission Reduction Alternatives: How Much is Enough?; Assumptions, Analytical Methods, and Evaluation Criteria of compliance plans; CAAA compliance costs and IRP. 2 figs., 3 tabs.

21370 (NRRI–93-8, pp. 91-114) **The role of integrated resource planning, environmental externalities, and anticipation of future regulation in compliance planning under the Clean Air Act Amendments of 1990.** Bernow, S. (Tellus Institute, Boston, MA (United States)); Biewald, B.; Wulfsberg, K. National Regulatory Research Inst., Columbus, OH (United States). Jul 1993. (CONF-9205161–Exc.: Regulatory policy issues and the clean air workshop; Regulatory policy issues and the clean air act workshop; International Energy Agency carbon dioxide disposal symposium, St. Louis, MO (United States); Charlotte, NC (United States); In *Regulatory policy issues and the Clean Air Act: Issues and papers from the state implementation workshops.* 217p. Order Number DE95008741. Source: OSTI; NTIS; GPO Dep.

Utilities are developing sulfur dioxide (SO_2) emission compliance plans to meet limitations of the Clean Air Act Amendments of 1990 (CAAA). Compliance plans will have long-term effects on resource selection, fuel choice, and system dispatch. Use of integrated resource planning (IRP) is necessary to ensure compliance plans are consistent with the overall societal goals. In particular, environmental externalities must be integrated with the compliance planning process. The focus of the CAAA is on air pollution reduction, specifically acid gases and toxics, and attainment of National Ambient Air Quality Standards (NAAQS) for criteria pollutants. Title IV specifically focuses on sulfur dioxide with a national allowance trading system, while further regulation of toxics and nitrogen oxides is slated for additional study. Yet, compliance planning based narrowly upon today's environmental regulations could fail to meet the broad goals of IRP if a larger array of environmental externalities is excluded from the analysis. Compliance planning must consider a broad range of environmental effects from energy production and use to (1) protect society's long-term stake in environmental quality, and (2) ensure that today's plans are rich enough to accommodate potential changes in regulation and national environmental goals. The explicit recognition of environmental effects, such as those associated with CO_2 release, will result in prudent compliance plans that take advantage of current opportunities for pollution avoidance and have long-term viability in the face of regulatory change. By including such considerations, the mix of resources acquired and operated (supply and demand, existing and new, conventional and renewable, fuel type and fuel quality, pollution control, and dispatch protocols) will be robust and truly least-cost.

21371 (NRRI–93-8, pp. 117-140) **Regulatory treatment of allowances and compliance costs.** Rose, K. (National Regulatory Research Institute, Columbus, OH (United States)). National Regulatory Research Inst., Columbus, OH (United States). Jul 1993. (CONF-9205161–Exc.: Regulatory policy issues and the clean air workshop; Regulatory policy issues and the clean air act workshop; International Energy Agency carbon dioxide disposal symposium, St. Louis, MO (United States); Charlotte, NC (United States); In *Regulatory policy issues and the Clean Air Act: Issues and papers from the state implementation workshops.* 217p. Order Number DE95008741. Source: OSTI; NTIS; GPO Dep.

The Clean Air Act Amendments of 1990 (CAAA) established a national emission allowance trading system, a market-based form of environmental regulation designed to reduce and limit sulfur dioxide emissions. However, the allowance trading system is being applied primarily to an economically regulated electric utility industry. The combining of the new form of environmental regulation and economic regulation of electric utilities has raised a number of questions including what the role should be of the federal and state utility regulating commissions and how those actions will affect the decision making process of the utilities and the allowance market. There are several dimensions to the regulatory problems that commissions face. Allowances and utility compliance expenditures have implications for least-cost/IPR (integrated resource planning), prudence review procedures, holding company and multistate utility regulation and ratemaking treatment. The focus of this paper is on the ratemaking treatment. The following topics are covered: ratemaking treatment of allowances and compliance costs; Traditional cost-recovery mechanisms; limitations to the traditional approach; traditional approach and the allowance trading market; market-based cost recovery mechanisms; methods of determining the benchmark; determining the split between ratepayers and the utility; other regulatory approaches; limitations of incentive mechanisms.

21372 (NRRI–93-8, pp. 141-149) **Utility regulators and the market for emission allowances.** Bohi, D.R. National Regulatory Research Inst., Columbus, OH (United States). Jul 1993. (CONF-9205161–Exc.: Regulatory policy issues and the clean air workshop; Regulatory policy issues and the clean air act workshop; International Energy Agency carbon dioxide disposal symposium, St. Louis, MO (United States); Charlotte, NC (United States); In *Regulatory policy issues and the Clean Air Act: Issues and papers from the state implementation workshops.* 217p. Order Number DE95008741. Source: OSTI; NTIS; GPO Dep.

When it comes to emission trading under the Clean Air Act, a major concern of most people in the electric utilities industry is the effect of this new form of environmental regulation on the industry and the way it is regulated. This paper focuses on a different concern: the effect of the industry and the way it is regulated on the emission trading program. Emission trading must prove to be successful in lowering the cost of reducing sulfur dioxide emissions if this approach to environmental regulation is to be regarded as a viable substitute for traditional command-and-control regulation. In

addition, whether or not utilities will buy and sell allowances as intended depends on the actions of the public utility regulators. This paper covers both setting the cost recovery rules and the incentive to sell and the capital gain.

21373 (NRRI–93-8, pp. 151-170) **Discussion paper on wholesale ratemaking considerations for sulfur dioxide emissions allowance trading.** Wessler, E. National Regulatory Research Inst., Columbus, OH (United States). Jul 1993. (CONF-9205161–Exc.: Regulatory policy issues and the clean air workshop; Regulatory policy issues and the clean air act workshop; International Energy Agency carbon dioxide disposal symposium, St. Louis, MO (United States); Charlotte, NC (United States); In *Regulatory policy issues and the Clean Air Act: Issues and papers from the state implementation workshops.* 217p. Order Number DE95008741. Source: OSTI; NTIS; GPO Dep.

The acid rain provisions of the Clean Air Act Amendments of 1990 (CAAA) created an allowance trading program for SO_2 emissions from electric utility power plants. Theoretically, the trading program will provide utilities the flexibility to control their SO_2 emissions at minimum aggregate societal costs. The trading program is a significant change from command-and-control environmental policies. A continuing concern is whether the market-oriented trading program is compatible with the pervasive rate regulation of the electric utility industry. Economists accept traditional rate regulation policies tend to provide incentives for utilities to minimize risks, rather than costs. To the extent that this is true, the allowance trading experiment is not likely to be successful. A number of commenters have described proposals for alternative regulatory policies to provide utilities with appropriate incentives for cost-minimization. These proposals focus on utility incentives at a "macro" level This paper has a "micro" level focus. It examines options for ratemaking that may also influence utility incentives for cost-minimization to provide a structured discussion of the different types of transactions that involve allowances. Emphasis is on the implications of allowance trading on ratemaking for wholesale power sales. Some of the same considerations that apply to wholesale ratemaking may also apply to retail ratemaking. Four generic types of allowance transactions are examined: Type 1: Unbundled Allowance Sales, Type 2: Wholesale Power Sales, Type 3: Pooling Arrangements, and Type 4: Holding Company Transactions. Each of these four generic allowance transactions is assessed along two 3 dimensions: jurisdictional issues and wholesale ratemaking considerations.

21374 (NRRI–93-8, pp. 173-186) **Allowance trading under the Clean Air Act: Who should regulate, and when?.** Lock, R. (LeBoeuf, Lamb, Leiby & MacRae, Washington, DC (United States)). National Regulatory Research Inst., Columbus, OH (United States). Jul 1993. (CONF-9205161–Exc.: Regulatory policy issues and the clean air workshop; Regulatory policy issues and the clean air act workshop; International Energy Agency carbon dioxide disposal symposium, St. Louis, MO (United States); Charlotte, NC (United States); In *Regulatory policy issues and the Clean Air Act: Issues and papers from the state implementation workshops.* 217p. Order Number DE95008741. Source: OSTI; NTIS; GPO Dep.

The goal of this paper is to explore how compliance with the Clean Air Act Amendments of 1990 (CAAA), especially Title IV and emission trading under it, will affect the current relationship between state and federal regulation. It is difficult, with the limited experience we have had under Title IV, to be definitive about or to be a very strong advocate of too many policy positions. What may be most helpful at this point is to identify where the difficult issues in state/federal relations might arise; and then to explore ways in which tensions might be either avoided or resolved. One anticipated conclusion is that a traditional regulatory mindset could be very destructive if applied to this new area of oversight without due sensitivity to what Congress is trying to achieve in Title IV. That concern pervaded the early legislative debates; and it persists today. Title IV presents some unique challenges to state regulators and will require some creative solutions and fresh thinking if the goals of Congress are to be realized and the full benefits that allowance trading can offer are to be reaped by electricity consumers. In the ultimate analysis, Title IV amounts to a massive internalization of the external costs imposed on society by acid rain deposition. (This places in serious question the notion of additional externality "adders" for sulfur dioxide (SO_2) and nitrous oxide (NO_x) at the state level for utility supply planning purposes.) The whole point of Title IV is to give those directly charged with compliance, namely power producers, the maximum flexibility to pursue least-cost compliance solutions. Perhaps the biggest single factor in how well they do this will be how state regulators respond to their compliance and allowance trading initiatives.

21375 (NRRI–93-8, pp. 187-216) **Acid rain compliance and coordination of state and federal utility regulation.** Nordhaus, R.R. (Van Ness, Feldman, and Curtis, P.C., Washington, DC (United States)). National Regulatory Research Inst., Columbus, OH (United States). Jul 1993. (CONF-9205161–Exc.: Regulatory policy issues and the clean air workshop; Regulatory policy issues and the clean air act workshop; International Energy Agency carbon dioxide disposal symposium, St. Louis, MO (United States); Charlotte, NC (United States); In *Regulatory policy issues and the Clean Air Act: Issues and papers from the state implementation workshops.* 217p. Order Number DE95008741. Source: OSTI; NTIS; GPO Dep.

The Clean Air Act Amendments of 1990 (CAAA) impose new controls on emissions by electric utilities of the two major precursors of acid rain: sulfur dioxide and oxides of nitrogen. Utilities, and the utility holding company systems and power pools of which they are members, will be subject to extensive and costly compliance obligations under the new stature. Most of these utilities, utility systems, and power pools are regulated by more than one utility regulatory authority. Utility regulators will need to coordinate their policies for ratemaking and for review of acid rain compliance strategies if least-cost solutions are to be implemented without imposing on rate payers and utility shareholders the costs and risks of inconsistent regulatory determinations. This article outlines the scope of the coordination problem and spells out possible approaches that utility regulators may take in dealing with it. Topics covered include the following: the 1990 Clean Air Act Amendments; acid rain (SO2); acid rain (NOx); costs of compliance; implications for utility regulation - federal and state utility regulatory framework; potential jurisdictional conflicts under existing state/federal utility regulatory scheme - single utility, holding companies, power pools; Utility regulatory issues under the 1990 amendments - planning conflicts, operational conflicts; methods for dealing with potential jurisdictional conflicts; coordination mechanisms - informal consultation, rulemaking,coordination of adjudicatory proceedings, FERC rate filings.

21376 (YMP-ESIT–42/1992) **East Europe Project: Co-operation for a better environment.** Ministry of the Environment, Helsinki (Finland). 1992. 4p. Order Number DE95779261. Source: OSTI; NTIS.

Published also in Finnish as Esite 45/1992 and in Swedish as Brochure 42/1992. Addiational information may be obtained from Ministry of the Environment, East Europe Project, P.O.Box 399, FIN-00121 Helsinki, Finland.

The East Europe Project, launched by the Finnish Ministry of the Environment in 1991 to protect the environment in neighbouring regions of Eastern Europe, is now fully under-way. The project has established itself as part of Finland's active, international environmental policy. Aiming at better air protection, protection of the Baltic Sea, and the development of hazardous waste management, using Finnish environmental know-how and technology The East Europe Project provides funds for joint projects which, when implemented, will bring significant cuts in airborne and waterborne pollution reaching Finland and the Baltic Sea. It will also improve hazardous waste management. Funds are granted to Finnish companies and corporations primarily promoting the use of Finnish environmental technology or testing new Finnish techniques or know-how.

National Renewable Energy Lab., Golden, CO (United States). Apr 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. (CONF-9509131–1: 22. annual National Energy and Environmental Division education and training symposium, Charlotte, NC (United States), 17-20 Sep 1995). Order Number DE95004087. Source: OSTI; NTIS; GPO Dep.

This paper begins by raising the issue of whether the theoretical model of customer-suppliers-products-services usefully describes the activities of laboratory life, using a case study from Fermilab. After describing scientific activities as work, not volunteerism, I present a model that has four performance parameters that can be used to evaluate DOE-funded research laboratories: (1) Do they have a well-defined management system? (2) Are they doing good science? (3) Are they managing their resources effectively? (4) Are they responsive to their customers? From these four parameters I describe how to metrify performance objectives, then use them to evaluate research organizations. I describe these performance objectives within the context of views I have published elsewhere, and according to Stephen R. Covey's metaphor of production/production capability (P/PC) balance in his book The 7 Habits of Highly Effective People.

The Chemical Technology Division is one of the largest technical divisions at Argonne National Laboratory, a leading center for research and development related to energy and environmental issues. Since its inception in 1948, the Division has pioneered in developing separations processes for the nuclear industry. The current scope of activities includes R&D on methods for disposing of radioactive and hazardous wastes and on energy conversion processes with improved efficiencies, lower costs, and reduced environmental impact. Many of the technologies developed by CMT can be applied to solve manufacturing as well as environmental problems of industry.

21380 (ANL/ER/CP–85412) **Performance specifications for technology development.** Erickson, M.D. Argonne National Lab., IL (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950209–9: 4. international symposium on field screening methods for hazardous wastes and toxic chemicals, Las Vegas, NV (United States), 22-24 Feb 1995). Order Number DE95012467. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of any instrument, technique, or method development project is to deliver needed and usable technologies to customers. To help the US Department of Energy's Office of Environmental Management and its investigators meet that goal, technology performance specifications are being developed for implementation in research and development and in documentation, testing, and evaluation projects. Technology performance specifications will be used to establish milestones, evaluate the status of ongoing projects, and determine the success of completed projects. Preliminary performance specifications will be required in proposals and will be highly weighted in the technical evaluation. The general performance specification approach is to document what currently exists or is nearing completion and compare that baseline to the customers' needs to identify the unmet requirements. These unmet requirements then form the basis for the technology development needs that OTD investigators must address. The process needs to be quantitative, where appropriate, to focus project goals away from vague generalities like "better" toward specifics "reduce detection limit from 50 μg/L to 100 ng/L", or from "cheaper" to "reduction of labor costs for step A from 4 hours to 0.5 hour."

21381 (ANL/ES/CP–86457) **Pulp and paper program fact sheets.** Argonne National Lab., IL (United States). [1995]. 28p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI; NTIS; GPO Dep.

Summaries are presented of Argonne technology transfer research projects in: sustainable forest management, environmental performance, energy performance, improved capital effectiveness, recycling, and sensors and controls. Applications in paper/pulp industry, other industries, etc. are covered.

21382 (DOE/CE/27504–T12) **Urban Consortium Energy Task Force applied research units and projects, 1992 program. Summary and abstracts.** Public Technology, Inc., Washington, DC (United States). Oct 1991. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC02-90CE27504. Order Number DE95011358. Source: OSTI; NTIS; GPO Dep.

This report contains brief descriptions of projects involved in the urban Consortium Energy Task Force (UCETF). The Consortium is a special network which helps to define urban problems, and commercialize technologies which could help solve those problems. Research and Development priorities within the program are transportation, energy, environment, and economic development and energy efficient facilities. The Consortium has established partnerships with US DOE on energy utilities, alternative vehicle fuels, waste management, and electricity management. A technology transfer committee was established to build a marketing program.

Source: OSTI; NTIS; INIS; GPO Dep.

This document presents the Texas Manufacturing Technology Center (TMTC) Business Plan to convert the Central Facility of the Superconducting Super Collider project to alternate uses. The plan is divided into six sections: (1) Executive Summary, (2) Market and Benefit Analysis, (3) Marketing Strategy, (4) Services, (5) Organization and Operations Overview, and (6) Financial Plan. Each area is supported by separate documents that address individual opportunities and challenges associated with transitioning the facility,

and its asset base to new uses for benefit of the locality, state, region and nation.

21385 (DOE/FE–0330) **Clean Coal Technology Demonstration Program. Program update 1994.** USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Apr 1995. 303p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012257. Source: OSTI; NTIS; GPO Dep.

The Clean Coal Technology Demonstration Program (CCT Program) is a $7.14 billion cost-shared industry/government technology development effort. The program is to demonstrate a new generation of advanced coal-based technologies, with the most promising technologies being moved into the domestic and international marketplace. Clean coal technologies being demonstrated under the CCT program are creating the technology base that allows the nation to meet its energy and environmental goals efficiently and reliably. The fact that most of the demonstrations are being conducted at commercial scale, in actual user environments, and under conditions typical of commercial operations allows the potential of the technologies to be evaluated in their intended commercial applications. The technologies are categorized into four market sectors: advanced electric power generation systems; environmental control devices; coal processing equipment for clean fuels; and industrial technologies. Sections of this report describe the following: Role of the Program; Program implementation; Funding and costs; The road to commercial realization; Results from completed projects; Results and accomplishments from ongoing projects; and Project fact sheets. Projects include fluidized-bed combustion, integrated gasification combined-cycle power plants, advanced combustion and heat engines, nitrogen oxide control technologies, sulfur dioxide control technologies, combined SO_2 and NO_x technologies, coal preparation techniques, mild gasification, and indirect liquefaction. Industrial applications include injection systems for blast furnaces, coke oven gas cleaning systems, power generation from coal/ore reduction, a cyclone combustor with S, N, and ash control, cement kiln flue gas scrubber, and pulse combustion for steam coal gasification.

21386 (DOE/GO–10095-076) **HBCU Program at Tennessee State University.** National Renewable Energy Lab., Golden, CO (United States). May 1995. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE93017082. Source: OSTI; NTIS; GPO Dep.

Historically and predominantly black colleges and universities (HBCUs) need to have a strong research capability to graduate engineering students with strong skills for competing in industry. The US Department of Energy's (DOE's) Office of Building Technologies (OBT) is working with HBCUs to help them develop that capability through its HBCU Program. The HBCU program has two goals: to help these institutions develop a research capability; to contribute to OBT's research needs. The program accomplishes these goals by helping institutions select a research topic with a strong engineering or science content, prepare a research proposal, and execute the work. This pamphlet describes the research on heat pump refrigerants at Tennessee State University.

21387 (DOE/GO–10095-153) **Technology partnerships: Enhancing the competitiveness, efficiency, and environmental quality of American industry. Executive summary.** National Renewable Energy Lab., Golden, CO (United States). Apr 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95004060. Source: OSTI; NTIS; GPO Dep.

This document briefly describes the Department of Energy's (DOE's) Office of Industrial Technologies (OIT) program. It profiles the energy, economic, and environmental characteristics of OIT's principal customers–the materials and process industries–that consume nearly 80% of all energy used by industry in the US. OIT-supported research, development, and demonstration (RD and D) activities relating to these industries are described as well as OIT's crosscutting technology programs that target the needs of multiple US industries. Quantitative estimates of the potential benefits (or metrics) to US industry of many current OIT-supported technologies are also discussed.

21388 (DOE/IG–0373) **Audit of Administration of Cooperative Research and Development Agreements at DOE National Laboratories.** USDOE Office of Inspector General, Albuquerque, NM (United States). Western Regional Audit Office. 19 May 1995. 22p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI.

Report to The Secretary.

DOE established policies to ensure that Cooperative Research and Development Agreements (CRADAS) enhance US competitiveness in the world economy, provide a reasonable return on resources invested, and enable successful commercialization of technologies developed. DOE's Office of Technology Partnerships issued a General Guidance Memorandum to DOE operations offices establishing policy goals for technology transfer programs, including CRADAS. Our audit disclosed that efforts to manage CRADAs at three national laboratories did not fully achieve DOE's policy goals outlined in the General Guidance Memorandum. Specifically, the audit showed that: (1) joint work statements did not always contain clearly defined information that allowed DOE to facilitate technology transfer or to evaluate CRADAs potential benefits; (2) CRADA statements of work did not always contain adequate documentation or address potential benefits; (3) the national laboratories reviewed did not have effective mechanisms for continuous self-appraisal or measures of overall program success; and (4) CRADA provisions did not exist to ensure an accurate evaluation of partner contributions.

21389 (INPO–95011853) **Institute of Nuclear Power Operations annual report, 1993.** Institute of Nuclear Power Operations, Atlanta, GA (United States). [1993]. 40p. Order Number DE95011853. Source: OSTI; INIS; NTIS; Institute of Nuclear Power Operations, 700 Galleria Parkway, Atlanta, GA 30339-5957 (United States).

This annual report highlights the activities of the Institute of Nuclear Power Operations. The topics of the report include the president and chairmen's joint message, overview of programs serving as the foundation for most of its activities, performance indicators for the US nuclear utility industry, and INPO's 1993 financial reports and rosters. INPO has four technical cornerstone programs that serve as the foundation for most of its activities. (1) Evaluations of nuclear power plants operated by member utilities are conducted on a regularly scheduled basis. (2) INPO supports its member utilities in their work to achieve and maintain accreditation of training programs. (3) Events analysis programs identify and communicate lessons learned from plant events so utilities can take action to prevent similar events at their plants. (4) INPO helps members improve in nuclear operations areas through assistance programs and other activities that continually evolve to meet the changing needs of the nuclear industry.

21390 (INPO–95012838) **Institute of Nuclear Power Operations 1994 annual report.** Institute of Nuclear Power Operations, Atlanta, GA (United States). [1994]. 41p. Order Number DE95012838. Source: OSTI; INIS; NTIS; Institute of Nuclear Power Operations, 700 Galleria Parkway, Atlanta, GA 30339-5957 (United States).

This annual report highlights the activities of the Institute of Nuclear Power Operations. The topics of the report include the president and chairmen's joint message, overview of programs serving as the foundation for most of its activities, performance indicators for the US nuclear utility industry, and INPO's 1994 financial reports and rosters. For nearly fifty years, the US national laboratories, under the direction of the Department of Energy, have maintained a tradition of outstanding scientific research and innovative technological development. With the end of the Cold War, their roles have undergone profound changes. Although many of their original priorities remain–stewardship of the nation's nuclear stockpile, for example–pressing budget constraints and new federal mandates have altered their focus. Promotion of energy efficiency, environmental restoration, human health, and technology partnerships with the goal of enhancing US economic and technological competitiveness are key new priorities. The multiprogram national laboratories offer unparalleled expertise in meeting the challenge of changing priorities. This volume aims to demonstrate each laboratory's uniqueness in applying this expertise. It describes the laboratories' activities in eleven broad areas of research that most or all share in common. Each section of this volume is devoted to a single laboratory. Those included are: Argonne National Laboratory; Brookhaven National Laboratory; Idaho National Engineering Laboratory; Lawrence Berkeley Laboratory; Lawrence Livermore National Laboratory; Los Alamos National Laboratory; National Renewable Energy Laboratory; Oak Ridge National Laboratory; Pacific Northwest Laboratory; and Sandia National Laboratories. The information in this volume was provided by the multiprogram national laboratories and compiled at Lawrence Berkeley Laboratory.

21392 (LBL-PUB–5396) **Lawrence Berkeley Laboratory Institutional Plan FY 1995–2000.** Lawrence Berkeley Lab., CA (United States). Dec 1994. 163p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95011292. Source: OSTI; NTIS; GPO Dep.

This report presents the details of the mission and strategic plan for Lawrence Berkeley Laboratory during the fiscal years of 1995–2000. It presents summaries of current programs and potential changes; critical success factors such as human resources; management practices; budgetary allowances; and technical and administrative initiatives.

21393 (NEDO-P–9322) **Feasibility study of developing energy combined technology. 2.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1994. 220p. (In Japanese). Order Number DE95786804. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

A study was made on feasibility of developing technology aiming at a combined utilization form of new energy. First, as a combined system using a functional medium, proposed was an energy system using hydrogen as an energy medium. Next, as an energy combined system with key technology as core, proposed were energy combined systems using as core methanol, chemical heat pump, plasma direct power generation, energy storage technology, environmental technology, etc. Further, as a combined system using characteristics of areas/sections, proposed was ECLIPSE (energy cascade for living and industry pursuing soundness and economy). Also proposed were a hydrogen medium energy application system, a night power application type sewage disposal treatment system, a biomass/solar total system, and a water resource production combined system. Hereafter, screening of the systems proposed and the feasibility study are carried out. 32 refs., 54 figs., 9 tabs.

21394 (NEI-DK–2004) **Energy research program 94. Supplement to Energy Research 1994. Program for expansion of Danish energy research and development during 1994-96.** Energistyrelsen, Copenhagen (Denmark). Mar 1995. 137p. (In Danish). Order Number DE95779205. Source: OSTI; NTIS.

This supplement to the document named 'Energiforskning 1994' gives print-outs of the Danish input from the database Nordisk Energi Index, (NEI, (Nordic Energy Index)). Risoe Library, at Risoe National Laboratory, is responsible for the coordination and the input to NEI of descriptions of energy research projects carried out in individual Nordic countries. The descriptions showed on the print-outs give project titles, summary descriptions of aims, methods etc., names, addresses, telephone and telefax numbers of institutions etc. responsible for the projects, names of project leaders, of other involved firms, institutes or institutions, and details of the total budget and the financing of the energy research projects. (AB)

21396 (ORNL/M–4087) **The Center for Environmental Technology Innovative Technology Screening Process.** Bertrand, C.M. Oak Ridge National Lab., TN (United States). Feb 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95008966. Source: OSTI; NTIS; INIS; GPO Dep.

The Center for Environmental Technology's (CET) mission is to provide a fully integrated system for accelerated evaluation, development, commercialization, and public acceptance of creative environmental solutions which match the foremost demands in today's environmentally sensitive world. In short, CET will create a means to provide quick, effective solutions for environmental needs. To meet this mission objective, CET has created a unique and innovative approach to eliminating the usual barriers in developing and testing environmental technologies. The approach paves the way for these emerging, cutting-edge technologies by coordinating environmental restoration and waste management activities of industry, universities, and the government to: efficiently and effectively transfer technology to these users, provide market-driven, cost-effective technology programs to the public and DOE, and aid in developing innovative ideas by initiating efforts between DOE facilities and private industry. The central part to this mission is selecting and evaluating specific innovative technologies for demonstration and application at United States Department of Energy (DOE) installations. The methodology and criteria used for this selection, which is called the CET Innovative Technology Screening Process, is the subject of this paper. The selection criteria used for the screening process were modeled after other DOE technology transfer programs and were further developed by CET's Technology Screening and Evaluation Board (TSEB). The process benefits both CET and the proposing vendors by providing objective selection procedures based on predefined criteria. The selection process ensures a rapid response to proposing vendors, all technologies will have the opportunity to enter the selection process, and all technologies are evaluated on the same scale and with identical criteria.

Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes elements of success for demonstration, evaluation, and transfer for deployment of innovative technologies for environmental restoration. They have been compiled from lessons learned through the US Department of Energy (DOE) Office of Technology Development's Volatile Organic Compounds in Arid Soil Integrated Demonstration (VOC-Arid ID). The success of

the VOC-Arid ID program was determined by the rapid development demonstration, and transfer for deployment of technologies to operational sites that improve on safety, cost, and/or schedule of performance over baseline technologies. The VOC-Arid ID successfully fielded more than 25 innovative technology field demonstrations; several of the technologies demonstrated have been successfully transferred for deployment Field demonstration is a critical element in the successful transfer of innovative technologies into environmental restoration operations. The measures of success for technology demonstrations include conducting the demonstration in a safe and controlled environment and generating the appropriate information by which to evaluate the technology. However, field demonstrations alone do not guarantee successful transfer for deployment There are many key elements throughout the development and demonstration process that have a significant impact on the success of a technology. This paper presents key elements for a successful technology demonstration and transfer for deployment identified through the experiences of the VOC-Arid ID. Also, several case studies are provided as examples.

21398 (SAND–95-0430) **Petroleum and geothermal production technology in Russia: Summary of information obtained during informational meetings with several Russian institutes.** Schafer, D.M.; Glowka, D.A.; Teufel, L.W. Sandia National Labs., Albuquerque, NM (United States). Apr 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95012523. Source: OSTI; NTIS; GPO Dep.

Russian scientists and engineers have drilled the deepest holes in the world. It is recognized that this experience has given them an expertise in drilling superdeep holes, as well as other aspects of drilling, completions, and geophysics. More and more US oil and gas companies are vigorously expanding their exploration and development into Russia. It is important for them to identify and use Russian technology in drilling, completion, logging, and reservoir characterization to the extent possible, in order to both reduce drilling costs and help support the Russian economy. While these US companies are interested in becoming involved in and/or sponsoring research in Russia, they have been unsure as to which scientists and institutes are working on problems of interest. It was also important to determine in which areas Russian technology is farther advanced than in the West. Such technology could then be commercialized as part of the Industrial Partnering Program. In order to develop a clear understanding of these issues, two Sandia engineers with drilling and completions expertise and a geophysicist with expertise in reservoir analysis traveled to Russia to meet with Russian scientists and engineers to discuss their technologies and areas of interest. This report contains a summary of the information obtained during the visit.

21399 (UCRL–52000-95-1/2) **Energy and technology review, January–February 1995. State of the laboratory.** Bookless, W.A.; Stull, S.; Cassady, C.; Kaiper, G.; Ledbetter, G.; McElroy, L.; Parker, A. (eds.). Lawrence Livermore National Lab., CA (United States). Feb 1995. 106p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95012112. Source: OSTI; NTIS; GPO Dep.

This issue of Energy and Technology Review highlights the Laboratory's 1994 accomplishments in their mission areas and core programs–economic competitiveness, national security, lasers, energy, the environment, biology and biotechnology, engineering, physics and space science, chemistry and materials science, computations, and science and math education. LLNL is a major national resource of science and technology expertise, and they are committed to applying this expertise to meet vital national needs.

21400 (UCRL-ID–118619-Rev.1) **Transfer of Air Force technical procurement bid set data to small businesses, using CALS and EDI. Summary report. Revision 1.** Lawrence Livermore National Lab., CA (United States). 10 Jan 1995. 31p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. (AITI–94-ED-01). Order Number DE95009559. Source: OSTI; NTIS; GPO Dep.

This report provides a summary of the Air Force CALS Test Network (AFCTN) Test Report Transfer of Air Force Technical Procurement Bid Set Data to Small Businesses, Using CALS and EDI (AFCTN Test Report 94-034, UCRL-ID-118619). It represents a synthesis of the results, conclusions, and recommendations, as well as a more concise presentation of the issues and strategies as viewed from AFCTN's perspective. This report documents a test transfer of three Air Force technical procurement bid sets to one large and twelve small businesses, using the Department of Defense (DoD) Continuous Acquisition and Life-cycle Support (CALS) and ANSI ASC X12 Electronic Data Interchange (EDI) standards. The main goal of the test was to evaluate the effectiveness of using CALS technical data within the context of the DoD's EDI-based standard approach to electronic commerce in procurement, with particular emphasis on receipt and use of the data by small contractors. Air Force procurement data was provided by the Sacramento Air Logistics Center at McClellan Air Force Base; the manufacturing participants were selected from among McClellan's 'Blue Ribbon' contractors, located throughout the United States. The test was sponsored by the Air Force CALS Test Network, headquartered at Wright-Patterson Air Force Base. The test successfully demonstrated the technical feasibility of including CALS MIL-R-28002 (Raster) engineering data in an EDI Specification/ Technical Information transaction set (ANSI ASC X12 841) when issuing electronic requests for quotation to small businesses. In many cases, the data was complete enough for the contractor participant to feel comfortable generating a quote.

21401 (UCRL-JC–118960) **Will man wish to prevail? Some fundamental choices facing humanity early in the Third Millennium.** Wood, L.L. Lawrence Livermore National Lab., CA (United States). Oct 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9410345–1: 3. Millennium: man, his limits and his hopes, Vareena (Italy), 2-6 Oct 1994). Order Number DE95010263. Source: OSTI; NTIS; GPO Dep.

With the subtle but occasionally vital exception of vaccination-induced immunity to many of the major infectious diseases, no human today is other than virtually identical biologically to those who greeted the dawn of the Second Millennium, nearly 1000 years ago. Culturally, however, we of the West are quite highly evolved from our ancestors of a millennium ago, primarily due to the advent of means for communicating with ever smaller latencies and ever higher bandwidths over ever greater distances in space and time: printed documents have been supplemented in succession by telephony, radio, video and, just now, the first personal communications sets. Also, within a fraction of a human lifetime from the present moment, the first prosthesis for the human brain has appeared and just very recently has become quite ubiquitous: digital computing systems. We are hardly members of the same species, culturally speaking; people of 1000 years ago would be truly and utterly lost in our communications-intensive civilization, and even a highly educated person from those times would swear that a personal computer equipped with a wireless communications module was as at least a familiar, if not a golem. Conversely, a computer-using person from our own times somehow translated back to 1000 A.D. would likely find the profound isolation and the "informational slowness" of life then to be acutely intolerable, certainly to a far greater extent than would a citizen of the High Middle Ages translated back to Augustus Caesar's Rome.

2906 Nuclear Energy

21402 (DOE/EIA–0436(94)) **World nuclear outlook 1994.** USDOE Energy Information Administration, Washington, DC (United States). Office of Coal, Nuclear, Electric and Alternate Fuels. Dec 1994. 131p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95011851. Source: OSTI; NTIS; GPO; INIS; GPO Dep.

As part of the EIA program to provide energy information, this analysis report presents the current status and projections through 2010 of nuclear capacity, generation, and fuel cycle requirements

for all countries in the world using nuclear power to generate electricity for commercial use. It also contains information and forecasts of developments in the uranium market. Long-term projections of US nuclear capacity, generation, and spent fuel discharges for three different scenarios through 2040 are developed for the Department of Energy's Office of Civilian Radioactive Waste Management (OCRWM). In turn, the OCRWM provides partial funding for preparation of this report. The projections of uranium requirements are provided to the Organization for Economic Cooperation and Development (OECD) for preparation of the Nuclear Energy Agency/OECD report, Summary of Nuclear Power and Fuel Cycle Data in OECD Member Countries.

21403 (DOE/S–0112) **Semiannual report to Congress on Inspector General Audit Reports, October 1, 1994–March 31, 1995.** USDOE Office of Civilian Radioactive Waste Management, Washington, DC (United States). May 1995. 20p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95013665. Source: OSTI; NTIS; GPO Dep.

This is the Secretary of Energy's twelfth Semiannual Report to Congress submitted under the Inspector General Act of 1978, as amended. Pursuant to the Inspector General Act Amendments of 1988 (Public Law 100-504), agency heads are to report to Congress on the status of final action taken on audit report recommendations. This report complements a report prepared by the Department's Office of Inspector General that provides information on audit reports issued during the period and on the status of management decisions made on Inspector General audit reports. During the period covered by this report, October 1, 1994 through March 31, 1995, the Department took final action on 32 operational, financial, and preaward audit reports. At the end of the period 90 reports awaited final action. Final action was taken on four contract and financial assistance audits, leaving four reports requiring final action at the end of the period. This report has three sections. The first section outlines significant audit resolution and followup accomplishments achieved by the Department during the reporting period. The second section contains the statistical tables that illustrate the status of final action on Inspector General audit reports. The third lists the audit reports that are one year or more past management decision and have not completed final action. This section also provides the status of corrective actions on each of these reports.

21404 (LA–12556-C, pp. 149-152) **Office of Nuclear Safety (NS) activities for 1992.** Fergus, I. Los Alamos National Lab., NM (United States). Sep 1994. (CONF-9205206–: DOE nuclear criticality safety technology project workshop, Gaithersburg, MD (United States), 12-14 May 1992). In *Proceedings of the first annual Nuclear Criticality Safety Technology Project.* 251p. Order Number DE95000557. Source: OSTI; NTIS; INIS; GPO Dep.

The Office of Nuclear Safety (NS) has undertaken several activities relating to nuclear criticality safety. For example, NS worked with Nuclear Energy (NE) on draft DOE 5480. CRIT, Nuclear Criticality Safety. NS concurred with the approach adopted by NE to streamline the DOE Order and rely mainly on mandatory American National Standards Institute (ANSI)/American Nuclear Society (ANS) standards where appropriate. NS concurred with minimizing sections of DOE Orders that repeated or restated "shall" statements in mandatory standards. NS accepted resolution of some of its comments on DOE 5480.CRIT based on NE's commitment to provide additional guidance in a Criticality Safety Program Guide. In the interim, NS is relying on performance assessments of nuclear criticality safety based on comparisons with best industry practices.

21405 (LA–12556-C, pp. 153-158) **Development of a criticality safety program guide for DOE nonreactor nuclear facilities.** Hopper, C.M. (Oak Ridge National Lab., TN (United States)). Los Alamos National Lab., NM (United States). Sep 1994. (CONF-9205206–: DOE nuclear criticality safety technology project workshop, Gaithersburg, MD (United States), 12-14 May 1992). In *Proceedings of the first annual Nuclear Criticality Safety Technology Project.* 251p. Order Number DE95000557. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper was a presentation and discussion of the US DOE's efforts to develop a NCS program guide for the implementation of 10CFR830.380. Topics of discussion were: (1) introduction/general practices; (2) definition of terms; (3) administration; (4) NCSA guidelines; (5) calculations; (6) conduct of operations; (7) state support; and (8) emergency preparedness.

21406 (LA–12556-C, pp. 159-163) **Revision 3 of TID-7016 "The Nuclear Safety Guide".** Pruvost, N.L. (Los Alamos National Lab., NM (United States)). Los Alamos National Lab., NM (United States). Sep 1994. (CONF-9205206–: DOE nuclear criticality safety technology project workshop, Gaithersburg, MD (United States), 12-14 May 1992). In *Proceedings of the first annual Nuclear Criticality Safety Technology Project.* 251p. Order Number DE95000557. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this presentation is to review the status of Revision 3 of TID-7016. Revision 3 has been in progress for about two years and should be published about one year from now. The publication will be unclassified and is supported jointly by DOE and NRC. The Nuclear Safety Guide was first issued in 1956 as a classified AEC report (LA-2063). Revision 1 appeared in 1961 as an unclassified document, and Revision 2, again unclassified, appeared in 1978. I think that the purpose of the Guide remains as stated in the forward of Revision 1.

21407 (LA–12556-C, pp. 164-176) **DOE scientific and technical information management.** Beasly, M. Los Alamos National Lab., NM (United States). Sep 1994. (CONF-9205206–: DOE nuclear criticality safety technology project workshop, Gaithersburg, MD (United States), 12-14 May 1992). In *Proceedings of the first annual Nuclear Criticality Safety Technology Project.* 251p. Order Number DE95000557. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper was a discussion of the mission objectives and program activities of the DOE Office of Scientific and Technical Information. Topics of discussion were: (1) program direction and structure; (2) representation in gov't and international organizations; (3) management of information; and (4) consultation and assistance.

21408 (LA–12556-C, pp. 177-182) **Criticality safety database.** Beasley, M. Los Alamos National Lab., NM (United States). Sep 1994. (CONF-9205206–: DOE nuclear criticality safety technology project workshop, Gaithersburg, MD (United States), 12-14 May 1992). In *Proceedings of the first annual Nuclear Criticality Safety Technology Project.* 251p. Order Number DE95000557. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper was a discussion of a NCS database using commercially available software (dBase III and dBase IV). Major topics of the database included geometries, processes, fissile and non-fissile materials, poisons. Database entries by topic, by publisher, and by year were presented.

21409 (LA–12556-C, pp. 184-188) **Price-Anderson Amendments Act, Code of Federal Regulations, DOE Orders, and ANSI-standards.** Malenfant, R.E. Los Alamos National Lab., NM (United States). Sep 1994. (CONF-9205206–: DOE nuclear criticality safety technology project workshop, Gaithersburg, MD (United States), 12-14 May 1992). In *Proceedings of the first annual Nuclear Criticality Safety Technology Project.* 251p. Order Number DE95000557. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper was a brief discussion of ongoing changes to two Price-Anderson Act, including 10CFR 820, 830, 834, and 835. Future rulemaking activities were also noted.

21410 (LA–12556-C, pp. 189-204) **Comments on 10 CFR 820, 830, 835 proposed safety rules for DOE nuclear activities.** Bergman, G. (Los Alamos National Lab., NM (United States)). Los Alamos National Lab., NM (United States). Sep 1994. (CONF-9205206–: DOE nuclear criticality safety technology project workshop, Gaithersburg, MD (United States), 12-14 May 1992). In *Proceedings of the first annual Nuclear Criticality Safety Technology Project.* 251p. Order Number DE95000557. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper was a discussion of LANL's comments to draft 10CFR 820, 830, and 835. In general comments, LANL recognized the authority of the governing organization but contended that: (1) the rules/approach needed major revision, (2) the rules are counterproductive, and (3) teamwork is reg'd in order to meet the goals.

21411 (LA–12556-C, pp. 205-206) **A community in transition.** Rutherford, D.A. (Los Alamos National Lab., NM (United States)). Los Alamos National Lab., NM (United States). Sep 1994. (CONF-9205206–: DOE nuclear criticality safety technology project workshop, Gaithersburg, MD (United States), 12-14 May 1992). In *Proceedings of the first annual Nuclear Criticality Safety Technology Project.* 251p. Order Number DE95000557. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper was an overview of ongoing changes in the NCS community. Specific discussions included the order and rule-making process and transition activities of LACEF.

2910 Conservation

21412 (CONF-950643–2) **Utility investments in low-income energy-efficiency programs.** Brown, M.A. Oak Ridge National Lab., TN (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 7. national demand-side management conference: delivering customer value; Dallas, TX (United States); 28-30 Jun 1995. Order Number DE95013208. Source: OSTI; NTIS; GPO Dep.

In the increasingly competitive utility industry, it is imperative that equity programs be as cost-effective as possible. In some cases, this is accomplished by working in partnership with government programs such as the US Department of Energy's low-income Weatherization Assistance Program. This paper provides an overview of the DSM and conservation programs being operated by utilities for low-income customers and describes the types of utility-government partnerships that exist.

2920 Supply, Demand, and Forecasting

Refer also to citation(s) 20649, 20653, 21402, 21424

21413 (ANL/OTD-EEST/CP–85089) **Energy technologies and their impact on demand.** Drucker, H. Argonne National Lab., IL (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950138–1: 3. annual Middle East petroleum and gas conference: the re-emergence of oil giants, Muscat (Oman), 15-17 Jan 1995). Order Number DE95012945. Source: OSTI; NTIS; GPO Dep.

Despite the uncertainties, energy demand forecasts must be made to guide government policies and public and private-sector capital investment programs. Three principles can be identified in considering long-term energy prospects. First energy demand will continue to grow, driven by population growth, economic development, and the current low per capita energy consumption in developing countries. Second, energy technology advancements alone will not solve the problem. Energy-efficient technologies, renewable resource technologies, and advanced electric power technologies will all play a major role but will not be able to keep up with the growth in world energy demand. Third, environmental concerns will limit the energy technology choices. Increasing concern for environmental protection around the world will restrict primarily large, centralized energy supply facilities. The conclusion is that energy system diversity is the only solution. The energy system must be planned with consideration of both supply and demand technologies, must not rely on a single source of energy, must take advantage of all available technologies that are specially suited to unique local conditions, must be built with long-term perspectives, and must be able to adapt to change.

21414 (DOE/EIA–0202(95/2Q)) **Short-term energy outlook: Quarterly projections. Second quarter 1995.** USDOE Energy Information Administration, Washington, DC (United States). Office of Energy Markets and End Use. 2 May 1995. 49p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95011898. Source: OSTI; NTIS; GPO; GPO Dep.

The Energy Information Administration (EIA) prepares quarterly, short-term energy supply, demand, and price projections for publication in February, May, August, and November in the Short-Term Energy Outlook (Outlook). An annual supplement analyzes the performance of previous forecasts, compares recent projections with those of other forecasting services, and discusses current topics related to the short-term energy markets. (See Short-Term Energy Outlook Annual Supplement, DOE/EIA-0202.) The forecast period for this issue of the Outlook extends from the second quarter of 1995 through the fourth quarter of 1996. Values for the first quarter of 1995, however, are preliminary EIA estimates (for example, some monthly values for petroleum supply and disposition are derived in part from weekly data reported in the Weekly Petroleum Status Report) or are calculated from model simulations using the latest exogenous information available (for example, electricity sales and generation are simulated using actual weather data). The historical energy data, compiled into the second quarter 1995 version of the Short-Term Integrated Forecasting System (STIFS) database, are mostly EIA data regularly published in the Monthly Energy Review, Petroleum Supply Monthly, and other EIA publications. Minor discrepancies between the data in these publications and the historical data in this Outlook are due to independent rounding. The STIFS database is archived quarterly and is available from the National Technical Information Service.

21415 (DOE/EP/10050–T6) **Indochina energy outlook. Report series Number 3.** Johnson, C.J.; Lamke, A.J.; Li, B. East-West Center, Honolulu, HI (United States). May 1995. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-93EP10050. Order Number DE95012422. Source: OSTI; NTIS; GPO Dep.

Indochina contains large energy resources of oil, gas, coal, and hydropower, and will become an important oil, gas, and electricity exporter in Southeast Asia over the next decade. The combination of substantial energy resources and economic reforms in Vietnam, Laos, and Cambodia are attracting major investments in the energy sector. This report discusses the economy; the resources, reserves, and projected production of oil, gas, coal, and hydropower; and electric power in Vietnam, Cambodia, and Laos. 10 refs., 7 figs., 3 tabs.

21416 (NEI-DK–2063) **End-use energy modelling for developing countries. A review of the end-use approach for projecting long-term energy use and GHG emissions.** Working Paper, 2. Sathaye, J.A. (Lawrence Berkeley Laboratory, Berkeley, CA (United States)). United Nations Environment Programme, Roskilde (Denmark). Collaborating Centre on Energy and Environment. Apr 1995. 43p. Order Number DE95787842. Source: OSTI; NTIS.

The end-use approach to the estimation of long-term energy demand and supply and the consequent emission of greenhouse gases are described. The approach consists of classifying energy demand according to its major end uses. Energy use is linked to the service provided by an end-use. The approach begins with the most detailed level of end-use and combines the detailed energy use into a more aggregated energy projection at the sectoral level. The sectoral energy use is added to yield the total energy demand by fuel type. The supply of primary energy is estimated on the basis of the demand for individual fuels and electricity for each major end use in each economic sector. The end-use approach uses projections of economic activity by sector, population, urbanization, electrification, etc. as determinants of energy demand. An approach which uses international comparisons as a basis for determining the future consumption and saturation of material goods, e.g., the saturation of consumer goods, such as appliances and cars is explained. This method assumes that developing countries will eventually reach income levels similar to those enjoyed by more developed economics. Factors for example, such as distances travelled per car, fuel use per kilometer and levels of car ownership determine the energy demand for automobiles. The availability of fuels and their relative prices as influenced by government policies determine the choice of fuels. Better methods of regular bottom-up data collection through end-use surveys need to be standardized for improved understanding and projections of energy demand in a developing country. End-use analysis will benefit energy planners and forecasters by helping to design targeted policies to improve the efficiency of energy supply. (AB) 38 refs.

21418 (DOE/MC/30084–3864) **The feasibility assessment of a U.S. natural gas production reporting system uniform production reporting model. Final report, July 1993–June 1994.** Oklahoma Univ., Norman, OK (United States). Sarkeys Energy Center. Jun 1994. 560p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG21-93MC30084. Order Number DE95000078. Source: OSTI; NTIS; GPO Dep.

The Uniform Production Reporting Model (UPRM) project was charged with identifying the best practices and procedures of the natural gas producing states related to the gathering, management, and dissemination of production data. It is recommended that the producing states begin the process of upgrading state systems using the concepts embodied in the UPRM model.

21419 (IEE-SR–261) **Trends of the gulf oil-producing countries, EU, and majors coping with variation in international balance between supply and demand of oil.** Institute of Energy Economics, Tokyo (Japan). Dec 1994. 175p. (In Japanese). Order Number DE95786742. Source: OSTI; NTIS; Available from The Institute of Energy Economics, Dai 10 Mori Biru, 18-1, Toranomon 1-chome, Minato-ku, Tokyo, Japan.

This is a record in 1993 on research of rationalization of oil distribution entrusted by the Resources and Energy Agency. The following trends were cached, and the two items (i.e., oil production policies of main countries of OPEC and recent trends of majors, and trends of EU's energy policy and energy laws in Russia) were studied. In future, a rise in demand in developing contries and large dependence on the Middle East caused by limitation of surplus production increase by non-the Middle East and non-OPEC countries are predicted. In spite of a large estimated amount of oil, there are some cases where economics and technologies limit maintenance of production ability. And global environmental problems, and increase in LNG demand, and privatization of the oil industry by part of oil-production countries (e.g., the Central South American countries) will effect closely on strategies between oil-producting countries and enterprises in the Western bloc. There is a possibility of rapid development of new oil and LNG by Western capitals in Russia. 47 refs., 46 figs., 48 tabs.

21420 (NEI-DK–2047) **Research and development related to oil and natural gas 1995 - 1999. Plan of management.** Energistyrelsen, Copenhagen (Denmark). Mar 1994. 14p. (In Danish). Order Number DE95787753. Source: OSTI; NTIS.

Danish production of North Sea oil commenced in 1971. Now the country produces its own domestic supplies and also exports oil and gas. This production is of great importance to the economy, at least until the middle of the next century, and the use of natural gas plays a special role in the planned reduction of carbon dioxide emission. The Danish government subsidizes research in this area, and the document presents the latest plan of management for the coming research programme. The overall aims, preconditions, the priorities given and the economic framework are specified. Suggestions for mediating results of the research projects are given. Priority is given to follow-up research, recovery, equipment and plants, and these are described. (AB)

2950 Hydrogen and Synthetic Fuels

21421 (ETDE-DE–127) **Norwegian Hydro Energy in Germany (NHEG). Executive summary.** Andreassen, K. (Norsk Hydro A.S. Research Centre Porsgrunn (Norway)); Buenger, U. Ludwig-Boelkow-Systemtechnik (LBST), Ottobrunn (Germany). 15 May 1992. 25p. Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany);Commission of the European Communities, Luxembourg (Luxembourg). Foerderkennzeichen BMFT 0329147A. Order Number DE95786068. Source: OSTI; NTIS (US Sales Only).

Transfer of renewable energy from remote areas to energy intensive industrial regions might be of prospective importance. The case study NHEG considers a system where Norwegian hydro energy is exported to Germany as hydrogen or electricity. The aim is to evaluate the technical and economical feasibility of a demonstration project paving the way for larger commercial projects in the future. Primarily hydrogen is considered as the energy carrier. Liquid hydrogen is produced in North-Norway, shipped to German ports and distributed to specific cities. Three alternatives are studied. The reference case is based on 100 MW hydro power, the two others on 20 MW. In the former a ship with fixed cryogenic tanks is applied for the LH_2 maritime transportation and cryogenic 40' containers with ISO standard dimensions for distribution to the users. In the latter ones the containers are supposed to be used for both transportation and distribution. In all cases evaporated GH_2 is assumed to be returned to the production plant for reliquefaction. The study indicates that the most interesting demonstration project should be a system using about 20 MW_{el} and having a production rate of 4.000 Nm^3 GH_2 per hour from an existing electrolysis plant. This may bring about 40.000 m^3 LH_2 per year to the customers and have an overall energy efficiency of about 58%. The capital investment including storage in a German port may be about 87 MDEM and the cumulative product cost about 0,25 DEM/kWh_{th}. Including distribution of LH_2 in Berlin as one example may increase the investment to about 114 MDEM and the product cost to about 0,31 DEM/kWh_{th} on today's premises. Long distance transmission of electricity may be an alternative to hydrogen transport. If electricity from Norway is used for liquid hydrogen production in Germany, the product cost will under realistic conditions be nearly the same as for imported LH_2. (orig.)

21422 (CONF-950643–1) **What has DSM achieved in California?.** Brown, M.A. (Oak Ridge National Lab., TN (United States)); Mihlmester, P.E. Oak Ridge National Lab., TN (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 7. national demand-side management conference: delivering customer value; Dallas, TX (United States); 28-30 Jun 1995. Order Number DE95012883. Source: OSTI; NTIS; GPO Dep.

Since the late 1980's, the four largest California investor-owned utilities have initiated and expanded various demand-side management (DSM) programs designed to produce energy and capacity savings and to provide comprehensive services to their customers. This commitment to energy efficiency was encouraged by the establishment of financial incentives for the utilities to acquire demand-side resources. The four utilities include: Pacific Gas and Electric Company (PG&E); San Diego Gas and Electric Company (SDG&E); and Southern California Edison (SCE), and Southern California Gas Company (SoCalGas). This paper summarizes the

results of 50 evaluation studies that assess California DSM programs operating between 1990 and 1992. The report concludes that in aggregate the California DSM programs outperformed DSM programs from the 1980's, in terms of more accurately forecasting energy and demand impacts.

21423 (CONF-950817–1) **Actual vs anticipated savings from DSM programs: An assessment of the California experience.** Brown, M.A. (Oak Ridge National Lab., TN (United States)); Mihlmester, P.E. Oak Ridge National Lab., TN (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 7. international conference on energy program evaluation: uses, methods and results; Chicago, IL (United States); 23-25 Aug 1995. Order Number DE95012882. Source: OSTI; NTIS; GPO Dep.

Since the late 1980's, utilities in California have used demand-side management (DSM) extensively to achieve a variety of corporate and public policy goals. This commitment to ene efficiency was encouraged by the establishment of financial incentives for the utilities to acquire demand-side resources. With restructuring of electric and gas markets underway in California, including recent cutbacks by the California utilities in their DSM program efforts, it is timely to review retrospectively the accomplishments of California's DSM investments. This paper summarizes the results of 50 evaluation studies that assess California DSM programs operating between 1990 and 1992. On average, the programs delivered 112% of the energy savings that were planned, and the typical program realized approximately 86% of the energy savings it was expected to deliver. Thus, the California DSM programs outperformed DSM programs from the 1980s, in terms of more accurately forecasting energy impacts. Among the 50 impact studies, lower realization rates are associated with residential-sector programs, relatively high ex-ante estimates of savings, and significant levels of free ridership.

21424 (CONF-950817–3) **Applying DSM evaluation results to utility planning.** Baxter, L.W. Oak Ridge National Lab., TN (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 7. international conference on energy program evaluation: uses, methods and results; Chicago, IL (United States); 23-25 Aug 1995. Order Number DE95013994. Source: OSTI; NTIS; GPO Dep.

This paper describes the results of a study to assess the application of DSM evaluation results to utility forecasting and planning. The paper has three objectives: (1) identify forecasting and planning applications of evaluation studies, (2) identify major obstacles and problems associated with applying evaluation results to forecasting and planning, and (3) suggest approaches to address the major problems. The paper summarizes results from interviews with utilities, regulators, and consultants to determine how the utility industry currently applies evaluation results in forecasting and planning. The paper also includes results from a detailed case study of Sacramento Municipal Utility District (SMUD) and Southern California Edison Company (SCE), two utilities with large DSM programs and active evaluation efforts.

21425 (DOE/EIA–0226(95/05)) **Electric power monthly, May 1995 with data for February 1995.** USDOE Energy Information Administration, Washington, DC (United States). Office of Coal, Nuclear, Electric and Alternate Fuels. 24 May 1995. 203p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012802. Source: OSTI; NTIS; GPO; GPO Dep.

The Electric Power Monthly (EPM) presents monthly electricity statistics for a wide audience including Congress, Federal and State agencies, the electric utility industry, and the general public. The purpose of this publication is to provide energy decisiommakers with accurate and timely information that may be used in forming various perspectives on electric issues that lie ahead. The publication provides monthly statistics at the State, Census division, and US levels for net generation, fossil fuel consumption and stocks, quantity and quality of fossil fuel, cost of fossil fuels, electricity sales, revenue, and average revenue per kilowatthour of electricity sold. Data on net generation, fuel consumption, fuel stocks, quantity and cost of fossil fuels are also displayed for the North American Electric Reliability Council (NERC) regions. The EIA publishes statistics in the EPM on net generation by energy source; consumption, stocks, quantity, quality, and cost of fossil fuels; and capability of new generating units by company and plant.

21426 (DOE/IG–0372) **The inspection of power purchase contracts at the Western Area Power Administration.** USDOE Office of Inspector General, Washington, DC (United States). Office of Inspections. May 1995. 45p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI (Free of Charge).

The Office of Inspector General received an allegation regarding possible irregularities in certain power purchase contracts awarded by the Western Area Power Administration (WAPA). Based on our survey of WAPA's power purchase procedures, we expanded our allegation based inquiry to include several management issues. Thus, the purpose of this inspection was to review the specific allegation as well as to evaluate WAPA's power purchase contracting procedures relating to competition, the documentation of the solicitation, negotiation, and award processes, and the determination of the reasonableness of the rates negotiated by WAPA.

21427 (DOE/PO–0033) **Weathering the cold of '94. A review of the January 1994 energy supply disruptions in the Eastern United States.** Department of Energy, Washington, DC (United States). Office of Strategic Petroleum Reserve. May 1995. 103p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95011786. Source: OSTI; NTIS; GPO Dep.

This report examines the causes of and responses to the very low temperatures over a wide region of the Eastern US causing unprecedented sustained demand for energy during the week of January 16–22, 1994. The topics of the report include the vagaries of the weather, the North American power supply structure, a chronology of major events of January, natural gas industry operations during peak demand periods, and recommendations for fuel supply, load forecasting, and energy emergency response exercises.

21428 (ETDE-DE–133) **Bayernwerk AG. 74th annual report, 1 October 1993 through 30 September 1994.** Bayernwerk AG, Muenchen (Germany). [1995]. 105p. (In German). Order Number DE95785450. Source: OSTI; NTIS (US Sales Only).

The tasks and activities of this German electric utility are presented. The 1993/'94 annual report comprises many financial data (balance sheet, profit-and-loss account, etc.). (UA)

21429 (ORNL/CON–415) **Identification and definition of unbundled electric generation and transmission services.** Kirby, B.; Hirst, E.; Vancoevering, J. Oak Ridge National Lab., TN (United States). Mar 1995. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95011625. Source: OSTI; NTIS; GPO Dep.

State and federal regulators, private and public utilities, large and small customers, power brokers and marketers, and others are engaged in major debates about the future structure of the electric industry. Although the outcomes are far from certain, it seems clear that customers will have much greater choices about the electric services they purchase and from whom they buy these services. This report examines the "ancillary" services that are today buried within the typical vertically integrated utility. These ancillary services support and make possible the provision of the basic services of generating capacity, energy supply, and power delivery. These ancillary services include: Management of generating units; reserve generating capacity to follow variations in customer loads, to provide capacity and energy when generating units or transmission lines suddenly fall, to maintain electric-system stability, and to provide local-area security; transmission-system monitoring and control; replacement of real power and energy losses; reactive-power management and voltage regulation; transmission reserves; repair and maintenance of the transmission network; metering, billing, and communications; and assurance of appropriate levels of power quality. Our focus in this report, the first output from a larger Oak Ridge National Laboratory project, is on identification and definition of these services. Later work in this project will examine more closely the costs and pricing options for each service.

21430 (PNL–10567) **Industrial demand side management: A status report.** Hopkins, M.F. (and others); Conger, R.L.; Foley, T.J. Pacific Northwest Lab., Richland, WA (United States). May

1995. 213p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95014507. Source: OSTI; NTIS; GPO Dep.

This report provides an overview of and rationale for industrial demand side management (DSM) programs. Benefits and barriers are described, and data from the Manufacturing Energy Consumption Survey are used to estimate potential energy savings in kilowatt hours. The report presents types and examples of programs and explores elements of successful programs. Two in-depth case studies (from Boise Cascade and Eli Lilly and Company) illustrate two types of effective DSM programs. Interviews with staff from state public utility commissions indicate the current thinking about the status and future of industrial DSM programs. A comprehensive bibliography is included, technical assistance programs are listed and described, and a methodology for evaluating potential or actual savings from projects is delineated.

21431 (PNL-SA-26114) **An approach to distribution short-term load forecasting.** Stratton, R.C.; Gaustad, K.L. Pacific Northwest Lab., Richland, WA (United States). Mar 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9503142--2: Workshop on environmental and energy applications of neural networks conference, Richland, WA (United States), 30-31 Mar 1995). Order Number DE95011418. Source: OSTI; NTIS; GPO Dep.

This paper reports on the developments and findings of the Distribution Short-Term Load Forecaster (DSTLF) research activity. The objective of this research is to develop a distribution short-term load forecasting technology consisting of a forecasting method, development methodology, theories necessary to support required technical components, and the hardware and software tools required to perform the forecast The DSTLF consists of four major components: monitored endpoint load forecaster (MELF), nonmonitored endpoint load forecaster (NELF), topological integration forecaster (TIF), and a dynamic tuner. These components interact to provide short-term forecasts at various points in the, distribution system, eg., feeder, line section, and endpoint. This paper discusses the DSTLF methodology and MELF component MELF, based on artificial neural network technology, predicts distribution endpoint loads for an hour, a day, and a week in advance. Predictions are developed using time, calendar, historical load, and weather data. The overall DSTLF architecture and a prototype MELF module for retail endpoints have been developed. Future work will be focused on refining and extending MELF and developing NELF and TIF capabilities.

21432 (DOE/EIA-0035(95/05)) **Monthly energy review, May 1995.** USDOE Energy Information Administration, Washington, DC (United States). Office of Energy Markets and End Use. 24 May 1995. 181p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012805. Source: OSTI; NTIS; GPO; GPO Dep.

Energy production during Feb 95 totaled 5.4 quadrillion Btu (Q), 3.1% over Feb 94. Energy consumption totaled 7.4 Q, 0.7% below Feb 94. Net imports of energy totaled 1.3 Q, 5.6% below Feb 94. This publication is divided into energy overview, energy consumption, petroleum, natural gas, oil and gas resource development, coal, electricity, nuclear energy, energy prices, and international energy.

21433 (DOE/EIA-0219(93)) **International energy annual, 1993.** USDOE Energy Information Administration, Washington, DC (United States). Office of Energy Markets and End Use. 8 May 1995. 168p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012804. Source: OSTI; NTIS; GPO; GPO Dep.

This document presents an overview of key international energy trends for production, consumption, imports, and exports of primary energy commodities in over 200 countries, dependencies, and areas of special sovereignty. Also included are population and gross domestic product data, as well as prices for crude oil and petroleum products in selected countries. Renewable energy includes hydroelectric, geothermal, solar and wind electric power and alcohol for fuel. The data were largely derived from published sources and reports from US Embassy personnel in foreign posts. EIA also used data from reputable secondary sources, industry reports, etc.

21434 (ETDE-DE-110) **Landeshauptstadt Kiel. News from the building department. Energy report 1991-1992.** Stadt Kiel (Germany). Hochbauamt. [1995]. 30p. (In German). Order Number DE95778070. Source: OSTI; NTIS (US Sales Only).

This annual report discusses the following subjects: Energy consumption and energy cost per annum; Energy prices and water prices in 1992; Distribution of energy types by user groups; Energy consumption per unit area; Savings of electrical energy; Modernisation measures in heating ans sanitary systems; water saving measures; Use of renewable energy sources in municipal swimming pools; Use of alternative energy sources. (orig./UA)

21435 (NEI-DK-2018) **Common trends in energy consumption in nine OECD countries.** Skriftserie C. Institut for Erhvervs- og Samfundsbeskrivelse, 63. Engsted, T.; Bentzen, J. Handelshoejskolen i Aarhus (Denmark). Inst. for Erhvervs- og Samfundsbeskrivelse. Nov 1994. 18p. Order Number DE95779217. Source: OSTI; NTIS.

Bivariate and multivariate co-integration techniques are used to test for common trends in energy consumption, real energy prices, and real income among nine OECD countries during the period 1951-1991. Two main results appear: First, shocks to energy consumption have been common to a number of countries. However, for some countries energy consumption has been mostly driven by country-specific factors. Second, we have found strong evidence that, in addition to real income and real energy prices, one or more non-stationary variables have an impact on energy consumption in the long run. An obvious candidate for this additional variable is energy efficiency (or technological progress). (au) (16 refs.)

21436 (UCRL-ID-18991-93) **California energy flow in 1993.** Borg, I.Y.; Briggs, C.K. Lawrence Livermore National Lab., CA (United States). 1 Apr 1995. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95011306. Source: OSTI; NTIS; GPO Dep.

Energy consumption in the state of California decreased about 3% in 1993 reflecting continuation of the recession that was manifest in a moribund construction industry and a high state unemployment that ran counter to national recovery trends. Residential/commercial use decreased slightly reflecting a mild winter in the populous southern portion of the state, a decrease that was offset to some extent by an increase in the state population. Industrial consumption of purchased energy declined substantially as did production of self-generated electricity for in-house use. Consumption in the transportation sector decreased slightly. The amount of power transmitted by the utilities was at 1992 levels; however a smaller proportion was produced by the utilities themselves. Generation of electricity by nonutilities, primarily cogenerators and small power producers, was the largest of any state in the US. The growth in the number of private power producers combined with increased amounts of electricity sold to the public utilities set the stage for the sweeping proposals before the California Public Utility Commission to permit direct sales from the nonutilities to retail customers. California production of both oil and natural gas declined; however, to meet demand only the imports of natural gas increased. A break in the decade-long drought during the 1992--1993 season resulted in a substantial increase in the amount of hydroelectricity generated during the year. Geothermal energy's contribution increased substantially because of the development of new resources by small power producers. Decline in steam production continued at The Geysers, the state's largest field, principally owned and managed by a public utility. Increases in windpower constituted 1--1/2% of the total electric supply--up slightly from 1992. Several solar photo voltaic demonstration plants were in operation, but their contribution remained small.

21437 (NEI-DK–1983) **Progress report on the economy of centralized biogas plants.** Energistyrelsen, Copenhagen (Denmark). Feb 1995. 35p. Order Number DE95779153. Source: OSTI; NTIS.

Public investment grants for the construction of biomass conversion plants producing methane for fuelling Danish cogeneration plants could be reduced, it is stated. Admixing of industrial organic wastes with manure and the use of effluent buffer storage tanks has lead to increased gas production. Transport of liquid manure and returning the digested effluent to the farmers accounts for 35%-50% of total operating costs. The use of top-mounted slow-rotating stirrers have produced positive results. Odour is still a problem in relation to these plants, burning ventilated air seems to be more reliable than using wood chip filters. Gas cleaning by adding ambient air to the biogas was found to be successful. Large, low-pressure, double membrane gas holders built on top of the effluent storage tanks are proved efficient. Transport is most efficiently carried out by using low pressure systems with condensate traps. Municipal solid organic wastes mixed with pig slurry and preheated to 70 degrees centigrade have been used with satisfactory results, plastic residues are separated after digestion to ensure a clean effluent. A gas production of 30-35 m^3 biogas per cubic meter feedstock is a precondition for the economic viability of a centralized biomass conversion plant in Denmark. Goals for future development are drawn up. (AB)

21438 (NEI-DK–2024) **Evaluation of the effectiveness of expenditure on renewable energy technology and the potentials for CO_2 reduction. Report supplementary to Plan of management for renewable energy 1995-97.** Ramboell, Hannemann og Hoejlund A/S, Virum (Denmark). Jan 1995. 73p. (In Danish). Order Number DE95787787. Source: OSTI; NTIS.

Based on a socio-economic comparison of various Danish renewable energy technologies dealt with in the document entitled Plan of Management for Renewable Energy Technologies 1995-97 (Handlingsplan for vedvarende energi 1995-97) produced by a Danish firm for the government, a budget analysis is to be made by the Danish energy Agency for the Ministry of Finance. The analysis (which compares various technology developments which could lead to CO_2 reduction and evaluates renewable energy technologies (RET) in relation to the extra costs for the Danish society connected with the reduction of CO_2) will be used to evaluate how the energy sector can, with the minimum of expense, meet the goals of 20% reduction of CO_2 emission in 2005 (in comparison with 1988 levels). Thus the aim is to analyse a selection of these technological developments related to renewable energy sources and the results will be used as a basis for a governmental plan of management for the development of renewable energy sources. (AB)

21439 (NEI-DK–2025) **Promotion of industry and exports for Danish renewable energy technology. Report supplementary to Plan of Management for Renewable Energy Sources 1995-97.** Ramboell, Hannemann og Hoejlund A/S, Virum (Denmark). Jan 1995. 88p. (In Danish). Order Number DE95787790. Source: OSTI; NTIS.

Danish energy policy gives priority to the reduction of CO_2 and other greenhouse gases which leads to the aim of increasing the use of renewable energy sources and thus widening the market for related technology to include other countries. Suggestions as to how to increase exports and thus achieve this aim are given. The Danish renewable energy branch is described in detail and the regional markets are characterized. Barriers to Danish export increase are identified. Smaller Danish firms would need financial support in order to work together in a form of association, but cooperation should now be initiated also with relation to promotion campaigns. Cooperation is already to be found within the wind turbine industry. The renewable energy sector provides considerable employment and exports within this branch constitute one eighth of total within the energy sector. The biggest market for Danish renewable energy technology (RET) is in Germany and other European Union (EU) member countries. To enter this market requires the instigation by EU of standardization, further development of Danish quality assurance and common quality marking procedures, and an increase in information dissemination, especially with regard to knowledge of EU's financial support programs. Recommendations are also given with reference to markets in east and central Europe, in Russia and in developing and recently industrialized countries. Danish authorities should ensure that Danish RET figures in international conferences etc. which means that representatives of this country should be continually updated on this subject and regulary report back to the domestic RET branch. (AB) (62 refs.)

21440 (NEI-DK–2045) **Suggestion for development programme for bioenergy.** Energistyrelsen, Copenhagen (Denmark). Udvalget for Biomasse til Energiformal. Jan 1995. 139p. (In Danish). Order Number DE95787759. Source: OSTI; NTIS.

Cover title: Bioenergi udviklingsprogram.

From 1992-1994, 89 million kroner have been used by the Danish government for subsidies to research related to biomass fuels, with emphasis laid on the production of methane. Part of these subsidies were given to the development of new technologies for the production of cogenerated electric power and heating, based on the use of wood and straw as fuel. 15 million kroner were used for follow-up programmes. During these 3 years some changes occurred. In 1983 the government demanded that power plants should gradually increase the use of straw and wood at central plants so that by 2000 1.2 million tons of straw and 0.2 million tons of wood chips would be used as fuels in cogeneration plants. Since the use of set-aside in farming was initiated, interest in using these areas for cultivating biomass crops for fuel grew. An interest has also developed in the use of biomass as additives to fuel and in the use of bio-fuels for vehicles. Against this background a new 3-year experimental programme has been drawn up by a governmental committee. The main points of general research strategy are to further the use of straw and wood chips in cogeneration plants, to make district heating plants less pollutive and flexible in the use of other fuels, to develop user-friendly, less pollutive boilers, to encourage independence of the use of industrial wastes that could be used as fuels in biomass conversion plants producing methane (and to encourage the use of household waste sorted at the source for these plants), to continue research on individual biomass conversion methane-producing plants located on farms and on the cultivation of biomass fuels. (AB)

21441 (NEI-DK–2060) **Communal biomass conversion plant. Sandholt - Lyndelse. Pilot project.** Mark, H.S.; Lyhne, P. Hedeselskabet, Viborg (Denmark). May 1995. 69p. (In Danish). Contract ENS-51161-94.0071. Order Number DE95787843. Source: OSTI; NTIS.

The technical, economical and environmental aspects related to the establishment of a communal methane-producing biomass conversion plant at Sandholt - Lyndelse (Denmark) are described in detail. Nine out of 14 involved local authorities have agreed to the idea of supplying household wastes that have been sorted at the source. The plant would be based on the supply of farm animal manures, organic industrial wastes as well as household wastes. It is of importance for the economic security of the plant that there should be a guarantee of a sufficient number of customers willing to purchase the produced methane, and that the price should harmonize with that of other forms of fuel. Sales, supply and production modules are set up. (AB)

21442 (NEI-DK–2061) **Communal biomass conversion plant. Sandholt - Lyndelse. Pilot project. Supplement.** Mark, H.S.; Pedersen, E.M. Hedeselskabet, Viborg (Denmark). May 1995. 45p. (In Danish). Contract ENS-51161-94.0071. Order Number DE95787844. Source: OSTI; NTIS.

The supplement to the document of the same title gives data on budgets, capacity for methane production, standard conditions for the collection of biomass, and the principles for the coordination of gas recovery at the municipal rubbish dumps and the operation of the biomass conversion plant, - all related to the detailed planning process for the establishment of a methane-producing biomass conversion plant in the Sandholt - Lyndelse area in Denmark. Also

included are diagrams illustrating the design principles of the prospective biomass conversion plant. (AB)

3005 Fuel Cells

Refer also to citation(s) 21156

21445 (DOE/FE–0335) **Fuel cell systems multi-year program plan, fiscal years 1995 to 2000.** USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of the Deputy Assistant Secretary for Advanced Research and Special Technologies. [1995]. 41p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95013664. Source: OSTI; NTIS; GPO Dep.

Fuel cell power systems are emerging power generation technologies for the efficient, economical and environmentally acceptable production of electricity. In some applications the by-product heat can also be efficiently used in cogeneration. Fuel cells produce electricity through the electrochemical oxidation of a fuel. They can be operated on a variety of fuels, including natural gas, coal gas, land fill gas and renewable fuels. First market entry units are fueled by natural gas. Fuel cells offer the opportunity for a major new manufacturing industry. System studies have shown that fuel cell power plants can be designed with overall system efficiencies in the 50 to 60 percent range (higher heating value basis) (55 to 65 percent on lower heating value basis). Fuel cell power plants are unique in that they offer high efficiency and low emissions even at part-load and in small sizes. Because of their efficiency, fuel cells will help in reducing CO_2 emissions. Additional benefits are the environmentally desirable operating characteristics offered by fuel cells. Because electricity is produced through an electrochemical reaction rather than by combustion, fuel cells generate very little NO_x and are extremely quiet. This combination of operating characteristics and high efficiency make fuel cells attractive for future electric utility applications. On-site industrial and commercial applications where the by-product heat can be utilized are also attractive. The DOE Office of Fossil Energy, the Gas Research Institute (GRI), and the Electric Power Research Institute (EPRI) are cooperatively sponsoring the development of fuel cell systems for applications in the utility, commercial and industrial sectors. Funding of development and demonstration is also provided by fuel cell developers and potential users. This document describes the fuel cell program of the DOE Office of Fossil Energy and its coordination with other fuel cell activities.

21446 (DOE/MC/25169–3095) **Novel solid state proton-conductors based on polymeric non-oxy acids. Final report.** Appleby, A.J. (Texas A and M Univ., College Station, TX (United States). Center for Electrochemical Systems and Hydrogen Research); Srinivasan, S.; Parthasarathy, A.; Gonzalez, E.R.; Desmarteau, D.; Gillette, M.S.; Ghosh, J.K.; Jalan, V.; Desai, M. Texas A and M Univ., College Station, TX (United States). Center for Electrochemical Systems and Hydrogen Research; Clemson Univ., SC (United States). Dept. of Chemistry; ElectroChem, Inc., Woburn, MA (United States). Jan 1992. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-88MC25169. Order Number DE95015701. Source: OSTI; NTIS; GPO Dep.

Objectives of this project were to prepare and characterize novel solid state proton-conductors and to evaluate these compounds as fuel cell electrolytes. The thrust was on the synthesis of new proton-conducting "model" and "polymeric" compounds, based on acid functions of the type $(R_fSO_2)_2NH$ and $(R_fSO_2)_2CH_2$ in appropriate fluorinated carbon structures, their physics-chemical characterization (Infra-red, Nuclear Magnetic Resonance, Differential Scanning Calorimetry, and X-ray Diffraction), and is pro. evaluation as candidate fuel cell electrolytes for use at elevated temperatures. This project consisted of four tasks (i) Synthesis of Proton-Conducting Polymer Electrolytes; (ii) Physical and Chemical Characterization of Proton-Conducting Polymer Electrolytes; (iii) Electrochemical Characterization of Proton-Conducting Polymer Electrolytes; and (iv) Evaluation of Proton-Conducting Polymer Electrolytes for Fuel Cells.

21447 (ETDE-DE–79) **Euro-Quebec Hydro-Hydrogen Pilot Project (EQHHPP). Supplementary task program. Final report. Supplement WP330, WP340, WP370, WP430, WP510.** Ludwig-Boelkow-Systemtechnik (LBST), Ottobrunn (Germany); CONOC Continental Contactors GmbH, Hamburg (Germany). Mar 1993. 51p. This report is an amendment to the final report, which has been submitted in June, 1992, as LBST-report No. 11/92.

"Within the scope of WP 370 of the EQHHPP Supplementary Task, a process engineering layout of the hydrogen supply systems is to be developed and the concept is to be examined under safety aspects. The main objective is to develop a storage concept which is also applicable to other consumers (e.g. Cogeneration Plant Harburg, MBB Finkenwerder). The fuel cell plant of HEW in Hamburg Barmbek is the reference installation for costumers using gaseous hydrogen." Based on the concepts developed in Phase II, "Two different storage system layouts were designed and examined under safety aspects: 1. Conventional store with stationary tanks filled by lorries. 2. Mobile tanks supplied by lorries and serving as stationary tanks within the installation." (orig.)

This report is an amendment to the final report, which has been submitted in June, 1992, as LBST-report No. 11/92.

"The operation of a 2 kW PAFC of FUJI Electric on hydrogen and the conditions of hydrogen recycling have been investigated theoretically as well as experimentally. A test facility for a 2 kW PAFC was designed and installed. The cell stack was operated at different temperatures, gas compositions, hydrogen and air utilizations. Current-voltage-characteristics of the cell were measured. The electrical cell efficiency as well as the excess heat was calculated with respect to the LHV of the utilized hydrogen. The characteristics were determined measuring cell voltages, flow rates and temperatures of gases and coolant oil. The experiments were made under continuous variation of the allowed current and at stationary current. (orig.)

21450 (LA-UR–95-1359) **Evaluation of the humidification requirements of new proton exchange membranes for fuel cells.** Grot, S.A.; Hedstrom, J.C.; Vanderborgh, N.E. Los Alamos National Lab., NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950412–9: Spring meeting of the Materials Research Society (MRS), San Francisco, CA (United States), 17-21 Apr 1995). Order Number DE95012060. Source: OSTI; NTIS; GPO Dep.

Measurements of PEM fuel cell device performance were made with different gas inlet temperatures and relative humidity using a newly-designed test fixture. Significant improvement in device performance was observed when the fuel inlet temperature was increased above the operating temperature of the cell. These measurements were then correlated to a model to describe energy and mass transport processes. Proton exchange membrane (PEM), fuel cells–the focus of this study–use an ion conducting polymer, especially polyperfluorosulfonic acid materials. These polymer materials, when imbibed with water, exhibit solution-like properties, but because the anions are chemically bound to the polymeric structure, the electrolyte is contained. Importantly, product water removal is simplified, as electrolyte dilution is not a concern. However, the proton transport rate is a function of the polymer geometry, which is set, in part, by the polymer water content. Consequently, dynamics of water flow are essential to understand the design of efficient conversion devices.

21451 (LBL–36813) **Thin-film electrolytes for reduced temperature solid oxide fuel cells.** Visco, S.J.; Wang, L.S.; De Souza, S.; De Jonghe, L.C. Lawrence Berkeley Lab., CA (United States). Nov 1994. 13p. Sponsored by Electric Power Research Inst., Palo Alto, CA (United States);Gas Research Inst., Chicago, IL (United States). DOE Contract AC03-76SF00098. (CONF-941144–146: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95011273. Source: OSTI; NTIS; GPO Dep.

Solid oxide fuel cells produce electricity at very high efficiency and have very low to negligible emissions, making them an attractive option for power generation for electric utilities. However, conventional SOFC's are operated at 1000°C or more in order to attain reasonable power density. The high operating temperature of SOFC's leads to complex materials problems which have been difficult to solve in a cost-effective manner. Accordingly, there is much interest in reducing the operating temperature of SOFC's while still maintaining the power densities achieved at high temperatures. There are several approaches to reduced temperature operation including alternative solid electrolytes having higher ionic conductivity than yttria stabilized zirconia, thin solid electrolyte membranes, and improved electrode materials. Given the proven reliability of zirconia-based electrolytes (YSZ) in long-term SOFC tests, the use of stabilized zirconia electrolytes in reduced temperature fuel cells is a logical choice. In order to avoid compromising power density at intermediate temperatures, the thickness of the YSZ electrolyte must be reduced from that in conventional cells (100 to 200 μm) to approximately 4 to 10 μm. There are a number of approaches for depositing thin ceramic films onto porous supports including chemical vapor deposition/electrochemical vapor deposition, sol-gel deposition, sputter deposition, etc. In this paper we describe an inexpensive approach involving the use of colloidal dispersions of polycrystalline electrolyte for depositing 4 to 10 μm electrolyte films onto porous electrode supports in a single deposition step. This technique leads to highly dense, conductive, electrolyte films which exhibit near theoretical open circuit voltages in H_2/air fuel cells. These electrolyte films exhibit bulk ionic conductivity, and may see application in reduced temperature SOFC's, gas separation membranes, and fast response sensors.

21452 (AUC-IBT-R–9442) **Air velocity in a room with displacement ventilation.** Nielsen, P.V. Aalborg Universitetscenter (Denmark). Inst. for Bygningsteknik. Dec 1994. 13p. (In Danish). Order Number DE95779155. Source: OSTI; NTIS.

High air velocities in a room with displacement ventilation are located close to the floor where the air moves in a thin layer through the occupied zone. The article describes a new design method which makes it possible to calculate the velocity distribution in this area and it is shown that the flow is a stratified flow governed by gravity forces. The articles gives a description of an adjacent zone which can be defined for a wall-mounted diffuser and a number of important details in the diffuser design are also discussed. The flow in rooms with furniture and rooms with short walls and other flow obstacles is discussed at the end of the article. (au)

Absorption chillers are heat-operate refrigeration without harmful environmental emissions (CFCs, HCFCS, and HFCS). The machine uses either steam or a gas-fired burner as the energy source and utilizes endothermic evaporation to provide refrigeration to an external process fluid, usually chilled water. In the United States, absorption chillers are used in regions where the cost of electricity is high relative to natural gas. Absorption chillers are also used in

applications where steam is readily available or in areas where seasonal load peaks cause utilities to subsidize gas cooling. This paper will describe the history of absorption, the basic absorption refrigeration cycle and some advanced high efficiency cycles. Practical applications of absorption refrigeration to commercial end uses will also be discussed.

21454 (CRIE-T–93047) **Study on the radiative cooling effect by spectrally selective surfaces.** Onuma, T. (Central Research Institute of Electric Power Industry, Tokyo (Japan)); Miyanaga, T. Central Research Inst. of Electric Power Industry, Tokyo (Japan). May 1994. 23p. (In Japanese). Order Number DE95787253. Source: OSTI; NTIS; Available from Central Research Institute of Electric Power Industry, 1-6-1, Otemachi, Chiyoda-ku, Tokyo, Japan.

In countering the heat island phenomena in urban areas, a radiative cooling effect predicting technique has been developed, which aims at the development and evaluation of a radiative cooling unit using spectrally selective surfaces in consideration of the optical characteristics of the atmosphere and of the wavelengths from the radiative surfaces. For the calculation of atmospheric radiation, LOWTRAN 7 is used, and absorption and radiation have been determined for 13 kinds of gasses including H2O, CO2, O2, and NOx, and for their airsols. Heat balance calculation on the radiative surfaces of the radiative cooling units is performed on the presumption that there is no exchange of heat by conduction or convection. The radiator used in the radiative cooling experiment is provided with heat insulating materials for the suppression of heat conduction and with a cover for the suppression of convection. The radiative surfaces are aluminum plates coated with black and white coating materials that are highly radiative in the far-infrared region, and aluminum plates and mirror-surface aluminum plates lined with selectively radiative vinyl fluoride. There is satisfactory agreement between the result of the experiment and the result of calculation, which endorses the validity of this predictive technique. 8 refs., 15 figs., 2 tabs.

21455 (DOE/CE/15606–T3) **Fiber-optic, anti-cycling, high pressure sodium street light control. Final technical progress report.** Blake (F.H.) and Associates, Mill Creek, CA (United States). 1 May 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-94CE15606. Order Number DE95011459. Source: OSTI; NTIS; GPO Dep.

This is the Final Technical Progress Report on a project to develop and market a Fiber-Optic Anti-Cycling High Pressure Sodium Street Light Control. The field test units are now being made with a single vertical PC board design and contains a computer-on-a-chip or PROM IC to take the place of the majority of the components previously contained on the upper logic board. This will reduce the final costs of the unit when it is in production and increase the control's flexibility. The authors have finished the soft tooling and have made the 400 plastic cases for the field test units. The new configuration of the cases entails a simplified design of the control shell which will have the lenses cast in place. The shell and base plastics are now finished and in final assembly awaiting the completion of the PC boards.

21456 (DOE/CE/23810–51C) **Investigation into the fractionation of refrigerant blends. Quarterly technical report, October 1–December 31, 1994.** Biancardi, F.R. (United Technologies Research Center, East Hartford, CT (United States)). Air-Conditioning and Refrigeration Technology Inst., Inc., Arlington, VA (United States); United Technologies Research Center, East Hartford, CT (United States). Jan 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91CE23810. (UTRC-R–94-970566-3). Order Number DE95011236. Source: OSTI; NTIS; GPO Dep.

While the use of refrigerant blends both from analytical predictions and system test results appear to offer certain performance, capacity, design and operational advantages, there are significant possible service and operational issues that are raised by the use of blends. Many of these issues occur due to the fractionation of the blends. Fractionation can result in increased safety hazards if during leakage the more volatile components are flammable, and must be considered in the design of the heat exchanger, expansion valves and other system components. Fractionation can occur during charging of the system or during leakage in selected two-phase components, as well as due to the different miscibility of the blend component refrigerants and the selected compressor lubricant. The objective of this ARTI-sponsored program is to conduct analytical and laboratory tests aimed at understanding these issues, developing approaches or techniques to predict these effects and/or overcome these potential problems, and conveying to the industry safe and reliable approaches.

21457 (DOE/CE/23810–57) **Accelerated test methods for life prediction of hermetic motor insulation systems exposed to alternative refrigerant/lubricant mixtures. Final report.** Ellis, P.F. II (Radian Corp., Austin, TX (United States)); Ferguson, A.F. Air-Conditioning and Refrigeration Technology Inst., Inc., Arlington, VA (United States). ©19 Apr 1995. 63p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91CE23810. Order Number DE95013070. Source: OSTI; NTIS; GPO Dep.

In 1992, the Air-Conditioning and Refrigeration Technology Institute, Inc. (ARTI) contracted Radian Corporation to ascertain whether an improved accelerated test method or procedure could be developed that would allow prediction of the life of motor insulation materials used in hermetic motors for air-conditioning and refrigeration equipment operated with alternative refrigerant/lubricant mixtures. Phase 1 of the project, Conceptual Design of an accelerated test method and apparatus, was successfully completed in June 1993. The culmination of that effort was the concept of the Simulated Stator Unit (SSU) test. The objective of the Phase 2 limited proof-of-concept demonstration was to: answer specific engineering/design questions; design and construct an analog control sequencer and supporting apparatus; and conduct limited tests to determine the viability of the SSU test concept. This report reviews the SSU test concept, and describes the results through the conclusion of the proof-of-concept prototype tests in March 1995. The technical design issues inherent in transforming any conceptual design to working equipment have been resolved, and two test systems and controllers have been constructed. Pilot tests and three prototype tests have been completed, concluding the current phase of work. One prototype unit was tested without thermal stress loads. Twice daily insulation property measurements (IPMs) on this unit demonstrated that the insulation property measurements themselves did not degrade the SSU.

21458 (DOE/CE/23810–59A) **Thermophysical properties of HCFC alternatives. Quarterly report, January 1–March 31, 1995.** Haynes, W.M. (National Inst. of Standards and Technology, Boulder, CO (United States). Thermophysics Div.). Air-Conditioning and Refrigeration Technology Inst., Inc., Arlington, VA (United States); National Inst. of Standards and Technology, Boulder, CO (United States). Thermophysics Div. Apr 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91CE23810. Order Number DE95011237. Source: OSTI; NTIS; GPO Dep.

Numerous fluids and fluid mixtures have been identified as promising alternatives to the HCFC refrigerants, but, for many of them, reliable thermodynamic data do not exist. In particular, reliable thermodynamic properties data and models are needed to predict the performance of the new refrigerants in heating and cooling equipment and to design and optimize equipment to be reliable and energy efficient. The objective of this project is to measure, with high accuracy, selected thermodynamic properties data for, two pure refrigerants and nine refrigerant blends; these data will be used to fit equations of state and other property models which can be used in equipment design. The new data will fill in gaps in the existing data and resolve problems and differences that exist in and between existing data sets. Most of the studied fluids and blends are potential replacements for HCFC-22 and/or R502; in addition, one pure fluid and one blend are potential replacements for CFC-13 in low temperature refrigeration applications.

21459 (DOE/GO–10095-060) **Loose-fill insulations.** National Renewable Energy Lab., Golden, CO (United States). May 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95009236. Source: OSTI; NTIS; GPO Dep.

FS-140.

Whether you are increasing the insulation levels in your current home or selecting insulation for a new home, choosing the right insulation material can be challenging. Fibrous loose-fill insulations such as cellulose, fiberglass, and rock wool are options you may wish to consider. This publication will introduce you to these materials–what they are, how they are applied, how they compare with each other, and other considerations regarding their use–so that you can decide whether loose fills are right for your home.

21460 (DOE/GO–10095-087) **Thermally activated heat pumps.** National Renewable Energy Lab., Golden, CO (United States). May 1995. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95004009. Source: OSTI; NTIS; GPO Dep.

This article describes research to develop efficient gas-fired heat pumps heat and cool buildings without CFCs. Space heating and cooling use 46% of all energy consumed in US buildings. Air-conditioning is the single leading cause of peak demand for electricity and is a major user of chlorofluorocarbons (CFCs). Advanced energy conversion technology can save 50% of this energy and eliminate CFCs completely. Besides saving energy, advanced systems substantially reduce emissions of carbon dioxide (a greenhouse gas), sulfur dioxide, and nitrogen oxides, which contribute to smog and acid rain. These emissions result from the burning of fossil fuels used to generate electricity. The Office of Building Technologies (OBT) of the US Department of Energy supports private industry's efforts to improve energy efficiency and increase the use of renewable energy in buildings. To help industry, OBT, through the Oak Ridge National Laboratory, is currently working on thermally activated heat pumps. OBT has selected the following absorption heat pump systems to develop: generator-absorber heat-exchange (GAX) cycle for heating-dominated applications in residential and light commercial buildings; double-condenser-coupled (DCC) cycle for commercial buildings. In addition, OBT is developing computer-aided design software for investigating the absorption cycle.

21461 (ETDE-DE–114) **The new Thermal Insulation Ordinance. Consequences in terms of construction physics and system design.** IVPU Nachrichten, v. 40. Gertis, K. (Fraunhofer-Institut fuer Bauphysik, Stuttgart (Germany)). Industrieverband Polyurethan-Hartschaum e.V., Stuttgart (Germany). Apr 1993. 8p. (In German). Order Number DE95780069. Source: OSTI; NTIS (US Sales Only).

The brochure summarizes the main statements of a lecture on the new Thermal Insulation Ordinance and the applications of hard foamed polyurethane. More low-consumption buildings will have to be constructed in the future, but the goal of CO_2 reduction set by the Federal Government will not be achieved unless older buildings will be modified as well. Low-consumption buildings necessitate competent planning, for which there should be financial rewards.

21462 (ETDE-DE–148) **Energy report Frankfurt am Main 1992.** Linder, M. Stadt Frankfurt am Main (Germany). Hochbauamt. 1993. 84p. (In German). Order Number DE95785917. Source: OSTI; NTIS (US Sales Only).

By joining the 'climate association of European cities', Frankfurt has agreed to reduce its CO_2-emissions by 50% by the year 2010. The so-called 'climate offense 1991' was the first regulatory paper to be set up by a community to reach this goal over a long term. This report now represents the present level of the project. Main points are the development of houses with low entropy, the retrofitting of heating systems, water saving measures and energy management. (BWI)

21463 (ILK-B–3/93/1314) **Investigation of ammonia for liquid cooling in the capacity range 5 to 30 kW. Final report.** Hommann, G. Institut fuer Luft- und Kaeltetechnik GmbH, Dresden (Germany). Apr 1992. 18p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 01ZH921B. Order Number DE95786070. Source: OSTI; NTIS (US Sales Only).

Meanwhile numerous alternatives are available for phase out of chlorofluorocarbons (CFC). The search for suitable replacements for CFC is focusing also on some traditional refrigerants such as ammonia. Ammonia is a well-entrenched refrigerant in industrial service. This project deals with the investigation of the expanded use of ammonia for commercial refrigeration (capacity range 5 to 30 kW). A liquid chiller testing plant with a capacity of 20 kW was designed and erected. This plant comprises plate-type heat exchangers and an elektronic expansion valve. Because of missing the plate-type evaporator the present testing results are still incompletely. (orig.). 3 tabs., 1 fig., 10 refs.

21464 (LBL–32420) **Meteorological modeling applications in building energy simulations.** Sailor, D.J.; Akbari, H. Lawrence Berkeley Lab., CA (United States). Aug 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-920828–31: American Council for an Energy-Efficient Economy (ACEEE) summer study on energy efficiency in buildings, Pacific Grove, CA (United States), 30 Aug - 5 sep 1992). Order Number DE95011269. Source: OSTI; NTIS; GPO Dep.

Researchers use sophisticated computer models to predict building energy use. These models require extensive input data including building characteristics and dimensions, load schedules, and weather data. The typical source for weather data is the weather station at the nearest airport. Specifically, hourly values of ambient air temperature are necessary. The data obtained from local airports, however, may be significantly different from the actual weather experienced by a nearby residential building. Thus, using local airport data when simulating a residential building may yield inaccurate results. Furthermore, researchers interested in evaluating the potential for heat island mitigation schemes (such as urban tree planting programs) to decrease building air-conditioning energy use need a method for modifying the local airport data accordingly.

21465 (LBL–36119) **The use of energy management and control systems to monitor the energy performance of commercial buildings.** Heinemeier, K.E. (Univ. of California, Berkeley, CA (United States). Dept. of Architecture). Lawrence Berkeley Lab., CA (United States). Dec 1994. 197p. Sponsored by USDOE, Washington, DC (United States);Texas A and M Univ., College Station, TX (United States);California Inst. for Energy Efficiency, Berkeley, CA (United States);California Univ., Berkeley, CA (United States). DOE Contract AC03-76SF00098. Order Number DE95012334. Source: OSTI; NTIS; GPO Dep.

Monitored data play a very important part in the implementation and evaluation of energy conservation technologies and programs. However, these data can be expensive to collect, so there is a need for lower-cost alternatives. In many situations, using the computerized Energy Management and Control Systems (EMCSs)–already installed in many buildings–to collect these commercial building performance data has advantages over more conventional methods. This method provides data without installing incremental hardware, and the large amounts of available operational data can be a very rich resource for understanding building performance. This dissertation addresses several of these issues. One specific objective is to describe a monitoring-project planning process that includes definition of objectives, constraints, resources and approaches for the monitoring. The choice of tools is an important part of this process. The dissertation goes on to demonstrate, through eight case studies, that EMCS monitoring is possible, and to identify and categorize the problems and issues that can be encountered. These issues lead to the creation, use, and testing of a set of methods for evaluation of EMCS monitoring, in the form of guidelines. Finally, EMCS monitoring is demonstrated and compared with conventional monitoring more methodically in a detailed case study.

21466 (LBL–36243) **Measurement of bidirectional optical properties of complex shading devices.** Klems, J.H.; Warner, J.L. Lawrence Berkeley Lab., CA (United States). Jan 1995. 21p. Sponsored by USDOE, Washington, DC (United States);American Society of Heating, Refrigerating and Air-Conditioning Engineers, Inc., Atlanta, GA (United States). DOE Contract AC03-76SF00098. A bg 87-127. (CONF-950104–9: American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE) winter meeting and exhibition, Chicago, IL (United States), 28 Jan - 1 feb 1995). Order Number DE95012250. Source: OSTI; NTIS; GPO Dep.

A new method of predicting the solar heat gain through complex fenestration systems involving nonspecular layers such as shades or blinds has been examined in a project jointly sponsored by ASHRAE and DOE. In this method, a scanning radiometer is used to measure the bidirectional radiative transmittance and reflectance of each layer of a fenestration system. The properties of systems containing these layers are then built up computationally from the measured layer properties using a transmission/multiple-reflection calculation. The calculation produces the total directional-hemispherical transmittance of the fenestration system and the layer-by-layer absorptances. These properties are in turn combined with layer-specific measurements of the inward-flowing fractions of absorbed solar energy to produce the overall solar heat gain coefficient. This paper describes the method of measuring the spatially averaged bidirectional optical properties using an automated, large-sample gonioradiometer/photometer, termed a "Scanning Radiometer." Property measurements are presented for one of the most optically complex systems in common use, a venetian blind. These measurements will form the basis for optical system calculations used to test the method of determining performance.

21467 (LBL–36896) **NFRC efforts to develop a residential fenestration annual energy rating methodology.** Crooks, B. (Cardinal IG, Minneapolis, MN (United States)); Larsen, J.; Sullivan, R.; Arasteh, D.; Selkowitz, S. Lawrence Berkeley Lab., CA (United States). Jan 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9506177–1: Window innovations conference, Toronto (Canada), 8-9 Jun 1995). Order Number DE95011282. Source: OSTI; NTIS; GPO Dep.

This paper documents efforts currently being undertaken by the National Fenestration Rating Council's Annual Energy Rating Subcommittee to develop procedures to quantify the energy impacts of fenestration products in typical residential buildings throughout the US. Parallel paths focus on (1) the development of simplified heating and cooling indices and (2) the development of a more detailed methodology to calculate the cost and energy impacts of specific products in a variety of housing types. These procedures are currently under discussion by NFRC's Technical Committee; future efforts will also address commercial buildings.

21468 (LBL–36933) **Simplified numerical description of latent storage characteristics for phase change wallboard.** Feustel, H.E. Lawrence Berkeley Lab., CA (United States). May 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95012758. Source: OSTI; NTIS; GPO Dep.

Cooling of residential California buildings contributes significantly to electrical consumption and peak power demand. Thermal mass can be utilized to reduce the peak-power demand, down-size the cooling systems and/or switch to low-energy cooling sources. Large thermal storage devices have been used in the past to overcome the short-comings of alternative cooling sources or to avoid high demand charges. With the advent of phase change material (PCM) implemented in gypsum board, plaster or other wall-covering material, thermal storage can be part of the building structure even for light-weight buildings. PCMs have two important advantages as storage media: they can offer an order-of-magnitude increase in thermal storage capacity and their discharge is almost isothermal. This allows to store large amounts of energy without significantly changing the temperature of the sheathing. As heat storage takes place in the building part where the loads occur, rather than externally (e.g., ice or chilled water storage), additional transport energy is not needed. To numerically evaluate the latent storage performance of treated wallboard, RADCOOL, a thermal building simulation model based on the finite difference approach, will be used. RADCOOL has been developed in the SPARK environment in order to be compatible with the new family of simulation tools being developed at Lawrence Berkeley Laboratory. As logical statements are difficult to use in SPARK, a continuous function for the specific heat and the enthalpy had to be found. This report covers the development of a simplified description of latent storage characteristics for wallboard treated with phase change material.

21469 (LBL–37024) **Energy Simulation studies in IEA/SHC Task 18 advanced glazing and associated materials for solar and building applications.** Sullivan, R. (Lawrence Berkeley Lab., CA (United States)); Selkowitz, S.; Lyons, P. Lawrence Berkeley Lab., CA (United States). Apr 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9506177–2: Window innovations conference, Toronto (Canada), 8-9 Jun 1995). Order Number DE95012374. Source: OSTI; NTIS; GPO Dep.

Researchers participating in IEA/SHC Task 18 on advanced glazing materials have as their primary objective the development of new innovative glazing products such as high performance glazings, wavelength selective glazings, chromogenic optical switching devices, and light transport mechanisms that will lead to significant energy use reductions and increased comfort in commercial and residential buildings. Part of the Task 18 effort involves evaluation of the energy and comfort performance of these new glazings through the use of various performance analysis simulation tools. Eleven countries (Australia, Denmark, Finland, Germany, Italy, Netherlands, Norway, Spain, Sweden, Switzerland, and the United States) are contributing to this multi-year simulation study to better understand the complex heat transfer interactions that determine window performance. Each country has selected particular simulation programs and identified the following items to guide the simulation tasks: (1) geographic locations; (2) building types; (3) window systems and control strategies; and (4) analysis parameters of interest. This paper summarizes the results obtained thus far by several of the research organizations.

21470 (LBL-PUB–758(Rev.3/95)) **From the lab to the marketplace: Making America's buildings more energy efficient.** Lawrence Berkeley Lab., CA (United States). [1995]. 43p. Since the mid 1970s, DOE has invested some $70 million in research and development at Lawrence Berkeley Laboratory (LBL) for development of advanced energy-efficient building technologies, software, and standards. That investment has helped spawn a $2.4-billion U.S. market for key products-energy-efficient lighting and advanced window coatings-and efficiency standards for residential equipment and computerized tools for more efficient building design. By 1993 DOE's initial investment had reduced consumers' energy bills by an estimated $5 billion ($1.3 billion in 1993 alone). By 2015 we estimate that the products of that investment will save consumers $16 billion annually. LBL research partnerships address a host of other building technology issues as well-building technology issues whose economic benefits are less easy to quantify but whose overall worth is equally important. We analyze public policy issues such as the role of efficiency options as a mitigation strategy for global climate change. We develop planning and demand-management methodologies for electric and gas utilities. We identify technologies and analytical methods for improving human comfort and the quality of indoor air. We contribute to the information superhighway. We focus on the special problems and opportunities presented by energy use in the public sector. And we do all these things at the local, national, and international levels. At LBL, we are part of the multi-laboratory, interdisciplinary approach to building technology research supported by DOE's Office of Energy Efficiency and Renewable Energy. We also participate in buildings-related research supported by DOE's Office of Health and Environmental Research, other federal agencies, and industry. This document describes LBL's role within this wider effort.

21471 (NEI-DK–1984) **Identification of the heat dynamics of greenhouses.** Nielsen, B.; Madsen, H. Statens Planteavlsforsoeg, Frederiksberg (Denmark). Afd. for Biometri og Informatik; Technical Univ. of Denmark, Lyngby (Denmark). Inst. of Mathematical and Operations Research. [1995]. 11p. Contract ENS-1213/91-0015. Order Number DE95779157. Source: OSTI; NTIS.

EFP-91.

In order to select an optimal control strategy for the heat input in greenhouses a reasonable description of the heat dynamics is required. This paper describes the identification of a model for the heat dynamics which takes the global radiation, outdoor air temperature and the heat supply as input variables. The model is a lumped parameter model formulated in state space form and in

continuous time. This formulation contains physical interpretable parameters. For the identification, data from experiments conducted in the winter 1992 have been used. Obviously, a greenhouse is a distributed system. However, the fundamental assumption of the lumped parameter system is that the heat capacity is collected at certain nodes of the system. The nodes correspond to the states used in the state space formulation. The state space model is estimated by a maximum likelihood method. Statistical methods as well as physical knowledge are used to validate the model. The results indicate that a third order model gives an appropriate description of the heat dynamics of the considered greenhouse. (au) (12 refs.)

21472 (NEI-DK–1985) **Identification of the heat dynamics of greenhouses: a course on using CTLSM.** Melgaard, H. (The Technical University of Denmark. Source: OSTI; NTIS.

EFP-91.

In order to select an optimal control strategy for the heat input in greenhouses a reasonable description of the heat dynamics of the green house is required. This paper describes the identification of a model for the heat dynamics which takes the global radiation outdoor air temperature and the heat supply as input variables. The model is a lumped parameter model formulated in state space form and in continuous time. This formulation allows directly physical interpretable parameters. For the identification, data from experiments conducted in the winter 1991 and winter 1992 are used. At the same time the steps involved in the identification serves as a course in using the software tool CTLSM for parameter estimation. The case discussed here is presented and more elaborated in the paper. (au)

21473 (NEI-DK–1986) **Heat flow models for use in modelling. The temperature in greenhouses.** Nielsen, B. Statens Planteavlsforsoeg, Frederiksberg (Denmark). Afd. for Biometri og Informatik. Dec 1993. 29p. (In Danish). Contract ENS-1213/91-0015. Order Number DE95779159. Source: OSTI; NTIS.

EFP-91.

Mathematical models are given in relation to using registered data from a greenhouse to predict how temperature and humidity will develop within the following 1 -2 hours. By comparing the predicted data with the required values for temperature and humidity and using results for the regulation of the temperature inside the greenhouse, a considerable amount of energy can be saved, especially in relation to sudden changes in outside weather. The mathematical models must describe the dynamic aspect of heating conditions in the greenhouse. (AB)

EFP-91. Presented at: International conference on agricultural engineering, Uppsala, Sweden 1992.

An experiment was conducted at The Department of Horticultural Engineering in January and February 1991 with the purpose of identifying thermal parameters of greenhouses. Climate and energy parameters were sampled very second minute. In order to decorrelate solar heating and heating from the heating system, the latter was controlled by a Pseudo Random Binary Signal (PRBS). Data was sampled from 2 periods: one period of 3 days (28-30 Jan.) and one period of 4 days (7-10 Feb.). A spectral density analysis on data shows predominance of low frequencies with periods larger then 20 minutes. For each period, a Box-Jenkins transfer function model was identified. The order of all models was less than three and an agreement between the two periods was observed for the heat transmission coefficients. For both periods a third order model was found and estimated. A short time-constant of about 4.4 to 5.5 minutes and a longer time-constant of about 20 to 30 minutes were observed. The purpose of estimating these transfer function models is to let models form the basis for an improved strategy of the energy supply. (au) (12 refs.)

Some of the most difficult problems encountered at federal sites in reducing energy consumption in a cost-effective manner revolve around understanding where energy is being used and what technologies can be employed to decrease energy use. Many large federal sites have one or two meters to track electric energy use for several thousand buildings and numerous industrial processes. Even where meters are available on individual buildings or family housing units, the meters are not consistently read. When the federal energy manager has been able to identify high energy users, the energy manager may not have the background, training, or resources to determine the most cost-effective options for reducing this energy use. This limitation can lead to selection of suboptimal projects that prevent the site from achieving full life-cycle cost savings. The U.S. Department of Energy (DOE) Federal Energy Management Program (FEMP) has been tasked by the U.S. Army Forces Command (FORSCOM) to identify, evaluate, and acquire all cost-effective energy projects at selected federal facilities. Pacific Northwest Laboratory (PNL) is assisting FEMP in this effort. This is part of a model program that PNL has developed to provide a systematic approach to evaluating energy opportunities. The program (1) identifies the building groups and end uses using the most energy (not just having the greatest energy-use intensity), and (2) evaluates the numerous options for retrofit or installation of new technology that will result in the selection of the most cost-effective technologies. In essence, this model program provides the federal energy manager with a road map to significantly reduce energy use in a planned, rational, cost-effective fashion that is not biased by the constraints of the typical funding sources available to federal sites.

21477 (PNL–9820-Rev.1) **Energy efficiency assessment methods and tools evaluation. Bolling Air Force Base. Revision 1.** McMordie, K.L.; Richman, E.E.; Keller, J.M.; Dixon, D.R. Pacific Northwest Lab., Richland, WA (United States). May 1995. 140p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95012765. Source: OSTI; NTIS; GPO Dep.

The goal of the U.S. Department of Energy (DOE) Federal Energy Management Program (FEMP) is to facilitate energy-efficiency improvements at federal facilities. This is accomplished by a balanced program of technology development, facility assessment, and use of cost-sharing procurement mechanisms. Technology development focuses upon the tools, software, and procedures used to identify and evaluate energy-efficiency technologies and improvements. For facility assessment, FEMP provides metering equipment and trained analysts to federal agencies exhibiting a commitment to improve energy use efficiency. To assist in procurement of energy-efficiency measures, FEMP helps federal agencies devise and implement performance contracting and utility demand-side management strategies. Pacific Northwest Laboratory (PNL) supports the FEMP mission of energy systems modernization. Under this charter, the Laboratory and its contractors work with

federal facility energy managers to assess and implement energy-efficiency improvements at federal facilities nationwide.

21478 (SBI-MEDD–108) **Energy and environmental analyses of buildings. Examples.** Nielsen, P. Statens Byggeforskningsinstitut, Hoersholm (Denmark). 1995. 29p. (In Danish). Contract ENS-1213/92-0011. Order Number DE95787729. Source: OSTI; NTIS.

EFP-92.

The Danish Building Research Institute has developed a model and a spreadsheet program for calculating the total energy consumption of buildings and their energy-related emissions of CO_2 and SO_2. This was used for analyses of 22 buildings. Total energy consumption for construction, operation and disposal, together with the energy-related emissions of CO_2 and SO_2 during the entire life cycle of the building, was calculated for 4 single-family houses and one apartment building, comprising houses of today's standard, low-energy houses and an experimental house (Villa Vision). Analyses and comparisons were carried out on the total energy consumption for construction and the net energy consumption for heating and ventilation. Energy consumption for construction and the total quantities of building goods were calculated for 22 buildings, including the 5 mentioned above. The buildings comprise housing, agricultural, industrial, institutional, and office buildings. An analysis was made to show total variation in the result of the calculation in relation to the future reuse and the energy source in question. Energy consumption for construction is ca. 5% of the total for housing. For low-energy houses it is ca. 20%, and for Villa Vision, ca. 60%. Energy consumption for construction of buildings built in accordance with 1982 Building Regulations amounts to 13-23% of the energy consumption. For low-energy houses, it is 75%, and for Villa Vision, it is 40% greater than net energy consumption. Energy consumption for construction is highest for houses and office buildings, and lowest for agricultural buildings. (AB) 18 refs.

21479 (SBI-R–242) **Energy and architecture - a collection of examples of newer buildings.** Aggerholm, S.; Svensson, O. Statens Byggeforskningsinstitut, Hoersholm (Denmark). 1995. 73p. (In Danish). Order Number DE95787774. Source: OSTI; NTIS.

A collection of examples of newer Danish buildings wherein special attention has been given to energy conservation combined with high quality architecture. Included are recently erected residential commercial, institutional and also retrofitted buildings. The aim has been to inspire architects and engineers to devote themselves to a higher degree to the inclusion of the concept of energy conservation in buildings. (AB) 17 refs.

21480 (BNL–52464) **Traffic congestion forecasting model for the INFORM System. Final report.** Azarm, A.; Mughabghab, S.; Stock, D. Brookhaven National Lab., Upton, NY (United States). May 1995. 109p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95012251. Source: OSTI; NTIS; GPO Dep.

This report describes a computerized traffic forecasting model, developed by Brookhaven National Laboratory (BNL) for a portion of the Long Island INFORM Traffic Corridor. The model has gone through a testing phase, and currently is able to make accurate traffic predictions up to one hour forward in time. The model will eventually take on-line traffic data from the INFORM system roadway sensors and make projections as to future traffic patterns, thus allowing operators at the New York State Department of Transportation (D.O.T.) INFORM Traffic Management Center to more optimally manage traffic. It can also form the basis of a travel information system. The BNL computer model developed for this project is called ATOP for Advanced Traffic Occupancy Prediction. The various modules of the ATOP computer code are currently written in Fortran and run on PC computers (pentium machine) faster than real time for the section of the INFORM corridor under study. The following summarizes the various routines currently contained in the ATOP code: Statistical forecasting of traffic flow and occupancy using historical data for similar days and time (long term knowledge), and the recent information from the past hour (short term knowledge). Estimation of the empirical relationships between traffic flow and occupancy using long and short term information. Mechanistic interpolation using macroscopic traffic models and based on the traffic flow and occupancy forecasted (item-1), and the empirical relationships (item-2) for the specific highway configuration at the time of simulation (construction, lane closure, etc.). Statistical routine for detection and classification of anomalies and their impact on the highway capacity which are fed back to previous items.

21481 (DOE/GO–10095-171) **Beating the traffic with commuting alternatives.** National Renewable Energy Lab., Golden, CO (United States). May 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE94006858. Source: OSTI; NTIS; GPO Dep.

This pamphlet describes how, by encouraging commuting options, local governments can help reduce air pollution, fuel consumption, and traffic congestion. Minimizing these problems makes the community more appealing to businesses, residents, and visitors and boosts the local economy. Approaches to alternative transportation are as varied as the communities devising and using them. But the critical factor is initiative from local governments, often one of communities largest employers. They can use and promote commuting alternatives among their employees. Local governments can also promote alternative transportation among other employers and the general public. They can provide information on commuting options, improve the infrastructure, and use local authority to require and reward those changes necessary to make alternative transportation a widely accepted part of community life. Best of all, local governments can lead by example and establish a template for other employers to follow.

21482 (NEI-DK–2026, pp. 43-52) **Truck and sustainable transport - cargo- and personal transport.** Joergensen, K. (Danmarks Tekniske Univ., Fysisk Inst., Energrigruppen, Lyngby (Denmark)). Transportraadet, Copenhagen (Denmark); Aalborg Univ. (Denmark). Trafikforskningsgruppen. 1994. (In Danish). Contract ENS-1753/92-0004. (CONF-9408240–Vol.1: Conference on traffic days at AUC, Aalborg (Denmark), 29-30 Aug 1994). In *Traffic days at AUC. Conference report vol. 1.* 223p. Order Number DE95787784. Source: OSTI; NTIS.

The part of truck transport in the Danish transportation system is described. Mechanisms of truck expansion and its consequences are summarized. The trucks represent a major share of the total fuel consumption and noxious emissions in Denmark. Sustainable transportation development depends on changes in the use of too powerful truck engines and a more efficient design. (EG) (15 refs.)

In most Danish cities we experience problems with the distribution of goods in the city centre. On the one hand the environment suffers from the impact of heavy lorries, and on the other hand the distributors have great difficulty in bringing goods to the city, because of traffic congestions and restrictions on the heavy traffic, enforced by the municipality. Since the traffic density in Danish cities is steadily growing, there will be increasing need for solutions of the problems. The municipality of Odense has initiated a project,

in which the problems will be analysed in search for future solutions. In 1993 the Commission of the European Union granted support to the project within the framework of the SAVE Programme. The Danish Transport Council, which is established by the Danish government, is furthermore giving support to the project. Odense is the third largest town in Denmark with approximately 170.000 inhabitants. (au)

21485 (NEI-DK–2048) **Cars, energy consumption and safety.** Skriftserie. Institut for Samfundsudvikling og Planlaegning. AUC, 111. Vibe-Petersen, J. Aalborg Universitetscenter (Denmark). Inst. for Samfundsudvikling og Planlaegning. Jun 1993. 220p. (In Danish). Order Number DE95787752. Source: OSTI; NTIS.

A detailed discussion of the threat to the environment of pollutive exhaust gases, noise pollution and the risk of accidents, caused by the continued increase in the use of automobiles. Conflicts in points of view of how to address this dilemma are described and it is debated to what extent energy conservation and environmental protection are compatible with the need to reduce the number of people injured as the result of traffic accidents. It is suggested that significant energy savings must be based on the use of lighter cars with smaller motors and that this does not mean that the standard of safety would be lowered. It is claimed that lightweight cars are involved in fewer accidents resulting in human injury, but passengers and drivers are less protected in the case of collisions with heavier vehicles. This problem could be solved by reducing the amount of heavy vehicles on the road. Raising safety standards will necessarily involve stricter demands on the part of the authorities in respect to the authorization of car types and the introduction of further safety safety standards and equipment. (AB)

21486 (NEI-DK–2050) **Ferry services over the Kattegat.** Trafikministeriet, Copenhagen (Denmark). 1995. 78p. (In Danish). Order Number DE95787757. Source: OSTI; NTIS.

In connection with the building of a bridge over the Great Belt (the waterway between the islands of Funen and Zealand in Denmark) the question of the future ferry services over the Kattegat strait had to be evaluated in the light of the introduction of new types of ferries for this service. The Ministry of Transport set up a working group to discuss the development of new types of ferry, the economic potentials for continuing the freight route with limited passenger capacity that runs between Kalundborg and Aarhus, possibilities for transporting trailers by ferry during the night, and the relation between developments of future routes and the traffic system on land - including an evaluation of the road network which leads to the ferry ports. The working group also evaluated environmental aspects of the development of the ferry services over the Kattegat. The results of these deliberations are presented. Attention is given to the pollution caused by ferries. (AB)

21487 (TKK-KO/AT–1994/1) **Vehicle navigation systems as a means to reduce energy use in transportation.** Karppinen, A. Helsinki Univ. of Technology, Otaniemi (Finland). Automotive Engineering. 1994. 83p. Project KTM-MOBILE 201T. Order Number DE95779246. Source: OSTI; NTIS.

MOBILE Research Programme.

The goal of this study is to establish the basis for the assessment of the potential of vehicle navigation systems as a tool to gain a reduction in traffic energy consumption. The most promising functions of the in-vehicle systems in this respect are navigation and route guidance. Dynamic traffic management realised with modern traffic information systems and working in parallel with the dynamic route guidance systems seems to have the highest potential in the task of reducing traffic energy consumption. In the study, the fundamental ideas of vehicle navigation are discussed. Then the categorisation of Road Vehicle Communication (RVC) systems and the relevant functions of in-vehicle systems are presented as the basis for descripting various systems. Traffic assignment models are an indispensable instrument in the assessment of vehicle navigation systems in the context on energy saving. Some of the recent models are discussed briefly. Future work will concentrate on a small scale field experiment in the greater Helsinki area and the development and exploitation of a dynamic traffic assignment model to evaluate the possible energy savings in the test area.

21488 (ANL/ESD/TM–80) **Utilization of surface-treated rubber particles from waste tires.** Smith, F.G. (Argonne National Lab., IL (United States). Energy Systems Div.). Argonne National Lab., IL (United States). Dec 1994. 105p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95012093. Source: OSTI; NTIS; GPO Dep.

During a 12-month program, the author successfully demonstrated commercial applications for surface-treated rubber particles in two major markets: footwear (shoe soles and components) and urethane-foam carpet underlay (padding). In these markets, he has clearly demonstrated the ease of using R-4080 and R-4030 surface-treated rubber particles in existing manufacturing plants and processes and have shown that the material meets or exceeds existing standards for performance, quality, and cost-effectiveness. To produce R-4080 and R-4030, vulcanized rubber, whole-tire material is finely ground to particles of nominal 80 and mesh size respectively. Surface treatment is achieved by reacting these rubber particles with chlorine gas. In this report, the author describes the actual test and evaluations of the participant companies, and identifies other potential end uses.

21489 (ANL/TD/CP–85711) **The choice: Welding with CO_2 or Nd:YAG lasers.** Leong, K.H. Argonne National Lab., IL (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9503113–2: Automotive laser applications workshop, Dearborn, MI (United States), 6-7 Mar 1995). Order Number DE95011825. Source: OSTI; NTIS; GPO Dep.

The recent commercial availability of multi-kilowatt Nd:YAG lasers has opened new avenues for rapid laser processing as well as intensified the competition (cost effectiveness) between CO_2 and Nd:YAG laser systems. Vendors offering Nd:YAG laser systems may claim lower operating costs (than CO_2) and fiberoptic beam delivery flexibility while CO_2 systems vendors may emphasize lower capital cost and well established processing requirements and experience. The capital and operating costs of a laser system are impacted by demand and supply economics and technological advances. Frequently the total cost of a workcell using a laser for processing has to be considered rather than the laser system alone. Consequently it is not very practical to approach the selection of a laser system based on its capital cost and estimated operating cost only. This presentation describes a more pragmatic approach to aid the user in the selection of the optimal multi-kilowatt laser system for a particular processing requirement with emphasis on welding. CO_2 laser systems are well established on the factory floor. Consequently, emphasis is given to the comparative application of Nd:YAG lasers, process requirements and performance. Requirements for the laser welding of different metals are examined in the context of hardware (laser system and beam delivery) selection and examples of welding speeds that can be achieved using CO_2 and Nd:YAG lasers are examined.

21490 (CRIE-R–93007) **Fundamental study of signal processing by optics. Part 3. Non distortion transmission of 2D-information in a fiber using an optical phase conjugator.** Kuribara, M. (Central Research Institute of Electric Power Industry, Tokyo (Japan)); Kurono, M.; Isawa, K. Central Research Inst. of Electric Power Industry, Tokyo (Japan). Mar 1994. 32p. (In Japanese). Order Number DE95787254. Source: OSTI; NTIS; Available from Central Research Institute of Electric Power Industry, 1-6-1, Otemachi, Chiyoda-ku, Tokyo, Japan.

For realizing a non-distortion transmission of 2D-information in an optical fiber, an experimental study has been undertaken concerning the compensation by a phase conjugate wave for the impact of modes generated in an optical fiber. As for the experimental devices, a crystal of BaTiO3 and BSO is used in case of degenerate four light wave mixing and a BaTiO3 crystal in case of self-excitation. The light source is an argon ion laser of a 0.5145-micron wavelength, and the optical fibers are of the SI type, 200/

230 and 400/550 microns in core clad diameter and 0.5 and 1 meter in length, polished obliquely at an angle of 8 degrees. The result of the experiment reveals that the wave surface after emission through the optical fiber assumes a speckled pattern due to optical fiber excited inter-mode interference. The result also shows, however, that the mode distortion is compensated for by the phase conjugate wave both in case of four optical wave mixing and of self-excitation. Further, for the generation of the phase conjugate wave, the spectral width of the light source needs to be approximately several MHz to several tens MHz. 14 refs., 19 figs., 1 tab.

21491 (CRIE-U–94018) **Design and operation of seawater recirculation fish culture system for Japanese flounder.** Honda, H. (Central Research Institute of Electric Power Industry, Tokyo (Japan)); Kikuchi, K.; Watanabe, Y.; Iwata, N.; Takeda, S.; Uemoto, H.; Furuta, T.; Kiyono, M. Central Research Inst. of Electric Power Industry, Abiko, Chiba (Japan). Aug 1994. 33p. (In Japanese). Order Number DE95787252. Source: OSTI; NTIS; Available from Central Research Institute of Electric Power Industry, 1-6-1, Otemachi, Chiyoda-ku, Tokyo, Japan.

For developing a recirculation fish culture system for Japanese flounder, a pilot system of $20m^3$ of water was designed and constructed, and a verification test was conducted. The system comprises an FRP-made breeding tank, 6m in internal diameter and 1.15m in height, a nitrification tank, a pump, a heat pump using air as the heat source, a UV germicidal unit, a denitrification tank, etc. The verification test revealed that flounder seeds the average body weight 5g grew up to a marketable weight of 500g in approximately 10 months. Thanks to the water purifying nitrification tank the concentration of ammonia and nitrous acid was kept at not more than 1mg per liter. The denitrification tank also functioned satisfactorily for the removal of nitric acid from the breeding water. The quantity of seawater per flounder produced was 1/2000 of the quantity required by the conventional method wherein seawater continuously flows. A tentative calculation of the running cost indicates that, with 12 of the system of this design in use, a total cost of 1000 to 1100 yen per year was required, the said total cost covering the seeds, feed, and electric power, for the production of 1kg of flounder, which sum is approximately equal to what is needed in the conventional method. 36 refs., 7 figs., 3 tabs.

21492 (DOE/CE/15602–T2) **[Replacement of thermally produced calcined clay with chemically structural pigments]. Quarterly technical report, April 1, 1995–June 30, 1995.** Whalen-Shaw, M. Whalen-Shaw (Michael), Circleville, OH (United States). 30 Jun 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC01-94CE15602. Order Number DE95014913. Source: OSTI; NTIS; GPO Dep.

Subject is coating of paperboard. Structured pigments designed to eliminate calcined clay were prepared and tested. Focus was on brown kraft and recycled paperboard which use 5–15% calcined clay with 20% TiO_2, the rest of the pigment being standard clay. Several structured (layered) pigments were compared to show brightness improvement after coating. The composite pigment formed with TiO_2 and EZ clay gave both excellent brightness and higher gloss. An attempt was made to make a structured pigment with cationic latex and standard clay that would replace a calcined clay-standard clay blend, for precoating paperboard.

21493 (DOE/CE/40006–T1) **Commercialization of on-machine sensors to measure paper mechanical properties. Final report.** Hall, M.S.; Brodeur, P.H.; Jackson, T.G. Institute of Paper Science and Technology, Atlanta, GA (United States). Sep 1994. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC05-93CE40006. Order Number DE95010952. Source: OSTI; NTIS; GPO Dep.

The objective of this project is to develop sensors capable of measuring the velocity of ultrasound in the thickness and in-plane directions of a moving paper web as it is being produced on the paper machine. The velocity of ultrasound can be used to determine various mechanical properties of paper, e.g., the square of the velocity times the basis weight is a measure of the extensional stiffness. On-machine measurements would allow continuous monitoring of product quality as well as provide data for controlling the papermaking process. This report summarizes work supported by Cooperative Agreement No. DE-FC05-93CE40006, USDOE, and by the member companies of the Institute of Paper Science and Technology (IPST). The central purpose of this grant, effective from October 1, 1993 through June 30, 1994, was to establish a plan: to develop a commercially viable system for on-machine, out-of-plane, and in-plane measurements of ultrasonic velocities; install a working system on a paper machine in a host paper mill; demonstrate the system's capabilities and benefits to the paper manufacturing industry; and have a vendor committed to providing and supporting the system. This report first presents a review of the background and potential benefits of on-line ultrasonic velocity measurements. Then the results of the work supported by the previous contract are summarized followed by additional measurements on moving webs in the laboratory. Out-of-plane (ZD) and in-plane ultrasonic velocity data for 26-lb medium and 42-lb liner samples are presented and discussed, illustrating the type of data that will be available from on-machine measurements. Finally, the status of the plans and support for continued work toward commercialization is reviewed.

21494 (DOE/GO–10095-170) **Technology partnerships: Enhancing the competitiveness, efficiency, and environmental quality of American industry.** National Renewable Energy Lab., Golden, CO (United States). Apr 1995. 142p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95004086. Source: OSTI; NTIS; GPO Dep.

An overview of the Department of Energy's Office of Industrial Technologies and its private sector partnerships is presented. Commercial success stories and real-world benefits of the technology partnerships are discussed.

21495 (DOE/ID/12911–1) **Rapid Glass Refiner Development Program, Final report.** Vortec Corp., Collegeville, PA (United States). 20 Feb 1995. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC07-90ID12911. Order Number DE95013072. Source: OSTI; NTIS; GPO Dep.

A rapid glass refiner (RGR) technology which could be applied to both conventional and advanced class melting systems would significantly enhance the productivity and the competitiveness of the glass industry in the United States. Therefore, Vortec Corporation, with the support of the US Department of Energy (US DOE) under Cooperative Agreement No. DE-FC07-90ID12911, conducted a research and development program for a unique and innovative approach to rapid glass refining. To provide focus for this research effort, container glass was the primary target from among the principal glass types based on its market size and potential for significant energy savings. Container glass products represent the largest segment of the total glass industry accounting for 60% of the tonnage produced and over 40% of the annual energy consumption of 232 trillion Btu/yr. Projections of energy consumption and the market penetration of advanced melting and fining into the container glass industry yield a potential energy savings of 7.9 trillion Btu/yr by the year 2020.

21496 (ETDE-DE–144) **Appropriate technologies - utilization of hydrodynamic power.** Aus der Praxis: Landesamt fuer Entwicklungszusammenarbeit. Senator fuer Hafen, Schiffahrt und Aussenhandel, Bremen (Germany). Landesamt fuer Entwicklungszusammenarbeit. 1993. 24p. (In German). Order Number DE95785918. Source: OSTI; NTIS (US Sales Only).

Within the framework of a demonstration project China was provided with thirty hydraulic rams from India for irrigation of a farming area of ca. 60 ha in the mountains. Different irrigation methods suited for developing countries are introduced placing emphasis on descriptions of the hydraulic ram. (BWI)

21497 (FEMP–2347) **Beneficial reuse of US DOE Radioactive scrap metal.** Motl, G.P. Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). 19 Jan 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. (CONF-950917–8: 5. international conference on radioactive waste management and environmental remediation, Berlin (Germany), 3-9 Sep 1995). Order Number DE95007826. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) has more than 2.5 million tons of radioactive scrap metal (RSM) that is either in inventory or expected to be generated over the next 25 years as major facilities

within the weapons complex are decommissioned. Since much of this metal cannot be decontaminated easily, past practice has been to either retain this material in inventory or ship it to DOE disposal sites for burial. In an attempt to conserve natural resources and to avoid burial of this material at DOE disposal sites, options are now being explored to "beneficially reuse" this material. Under the beneficial reuse concept, RSM that cannot be decontaminated and free released is used in applications where the inherent contamination is not a detriment to its end use. This paper describes initiatives currently in progress in the United States that support the DOE beneficial reuse concept.

21498 (KCP–613-5632) **Adhesive materials and processing selection for environmentally conscious manufacturing.** Tira, J.S. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Jun 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. (CONF-9507133–1: Planning for a responsible 21st century, Boston, MA (United States), 30 Jul - 2 aug 1995). Order Number DE95013484. Source: OSTI; NTIS; GPO Dep.

Manufacturers that use certain adhesives and related manufacturing processes must consider the impact they have on worker health, safety, and the environment. Product manufacturers must find alternate replacements for solvent-based adhesives and solvent cements. In addition, processes that use ozone-depleting solvents for hand-wipe cleaning operations as well as vapor degreasing must find suitable alternates in order to be environmentally compliant. Likewise, manufacturers that use etching solutions that contain chrome must find a replacement. This paper identifies some of the specific problems associated with using certain adhesives and manufacturing processes. Environmentally acceptable alternative adhesives and processes are presented.

21499 (LUTMDN-TMVK–5248) **A technical and economic feasibility study of cogeneration of heat and power in a Thai textile company. Minor Field Study 1994:48/49.** Sjoestedt, J.; Aakesson, J.Aa. Lund Univ. (Sweden). Dept. of Heat and Power Engineering. Mar 1995. 70p. Order Number DE95779302. Source: OSTI; NTIS; INIS.

Examination paper.

This feasibility study deals with cogeneration of heat and power in a textile company. The study was undertaken as a Minor Field Study in Bangkok, Thailand. The gas turbine and the gas engine are identified as the most suitable techniques, due to low initial investment cost, high reliability and high power to heat ratio. An alternative with a gas turbine and double-effect absorption chiller shows the best profitability and a very high EUF, 0.82. The NPV of this investment is 364 million Baht corresponding to an IRR of 41.52% The gas engine alternative generates approximately the same profitability, but the EUF is lower. The gas engine will become even more attractive if some of the steam can be replaced by hot water in the process. To sum up: Both alternatives are technically feasible and the profitability is so high that a more thorough detail study should be undertaken. 30 refs, 19 figs, 22 tabs

21500 (NEI-DK–1995) **Branch analysis of energy for foundries. Supplementary report.** Ravn, O. (DTI, Energi (Denmark)); Olsen, H.; Crepaz, R.; Togeby, M. Dansk Teknologisk Inst., Taastrup (Denmark). Energiteknologi. Aug 1994. 69p. (In Danish). Order Number DE95779151. Source: OSTI; NTIS.

This report, a supplement to the main report entitled 'Branch analysis of energy for the Danish foundry industry' gives details of the energy analysis with regard to the individual foundries examined. (AB)

21501 (NEI-DK–2007) **Efficient public transport in rural and low density urban areas.** Energy Centre Denmark, Copenhagen (Denmark). [1995]. 56p. (In English, French, German). Order Number DE95779201. Source: OSTI; NTIS.

All European countries have large areas characterized by low population density, where agriculture and small-scale industry often play a predominant role. Here transport services are often restricted and this can affect the quality of life of the local inhabitants, so that an infrastructure and public transport system that can compete with motor car flexibility is required. The aim of the publication is to propose solutions to the lack of public transport in low population density areas, and these solutions should take socio-economic, environmental and energy saving considerations into consideration. Some of the solutions offered are the use of multi-purpose vehicles, transport coordination, removal of organizational barriers, the use of computer and communication technology and methods of decreasing energy consumption within the field of transportation. Motives for the development of public transport are also dealt with. (AB)

21502 (NEI-DK–2035) **Branch analysis of energy for foundries. Main report.** Ravn, O. (DTI, Energi (Denmark)); Olsen, H.; Crepaz, R.; Togeby, M. Dansk Teknologisk Inst., Taastrup (Denmark). Energiteknologi. Aug 1994. 94p. (In Danish). Order Number DE95787768. Source: OSTI; NTIS.

Branch energy analysis has been accomplished for the Danish Foundry Branch Association, assisted by the Energy Agency. The period covered is September 1993 - May 1994. 6 foundries considered to be representative for the branch were analyzed in detail. The most profitable possibilities of energy saving measures were localized. Investigation of the energy requiring processes proved that energy consumption of a foundry is primarily concentrated in 3 areas, consuming about 80 % of the total energy consumption. These three areas are casting, ventilation and pressurized gases. The 6 surveyed foundries can save energy corresponding to ca. 30 mln kWh. Energy consumption is distributed over electric power (roughly 65 %), gas (roughly 20 %), oil (roughly 11 %), district heating (4 %). The large saving potentials are to be released by: covering the melters, covering with built-in gas burner to heat the foundry ladles, recovering heat from the cooling water from melters and compressors, reducing the pressure drop above the filter and optimizing the exhaust system etc. (EG) 41 refs.

21503 (NEI-DK–2042) **Energy consumption in relation to industrial products and processes. Results of projects.** Business Consultants ApS, Frederiksberg (Denmark). Jan 1995. 41p. (In Danish). Order Number DE95787800. Source: OSTI; NTIS.

The aim of investigating recent research results connected to energy conservation within industry was to discover whether this area of research carried out under the auspices of the Danish Ministry of Energy radically contributed to the overall energy-saving goals and whether the methods of information dissemination to the industrial sector and the usage of the research results by the industrial sector have been satisfactory. 41 research projects, of which 33 are concluded, are described. It is generally concluded that good results have been achieved, although a little more flexibility could be wished for. The research results have had some significance in relation to energy conservation measures within industry. Special attention must continually be given to process optimization and efforts to further expand and coordinate have already been initiated. (AB)

21504 (PNL–9466) **Impact evaluation of a slush stock chest bypass installed at Scott Paper Company under the energy $avings plan.** Oens, M.A.; Spanner, G.E. Pacific Northwest Lab., Richland, WA (United States). Feb 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95012396. Source: OSTI; NTIS; GPO Dep.

This impact evaluation of the bypass of a slush stock chest that was recently installed at Scott Paper Company (Scott Paper) was conducted for the Bonneville Power Administration (Bonneville) as part of an evaluation of its Energy $avings Plan (E$P) Program. The project consists of installing an adjustable speed drive, a 74.6 kW (100 hp) pump, a re-sized impeller, and piping modifications to bypass the slush stock chest and related equipment. The objective of this impact evaluation was to assess how much electrical energy is being saved at Scott Paper as a result of the E$P and to determine how much the savings cost Bonneville and the region. The impact of the project was evaluated with a combination of engineering analysis, financial analysis, interviews, and submittal reviews (Scott Paper's proposal and completion report). Based on this impact evaluation, energy savings from this project are expected to be 763,600 kilowatt-hours/year (kWh/yr) or 0.087 average megawatts (aMW). On a per-ton basis, this project will save 4.64 kWh/ton or 39.2%. The project cost $120,098 to install, and Scott Paper received payment of $82,232 (in 1993 dollars) from

Bonneville for the acquisition of energy savings. Pacific Northwest Laboratory calculated the real levelized cost of the energy savings to Bonneville as 14.2 mills/kWh (in 1993 dollars) over the project's assumed 15-year life, and the real levelized cost to the region as 21.9 mills/kWh, not including transmission and distribution effects. The project would not have been implemented without the acquisition payment from Bonneville and therefore is not a free rider.

21505 (PNL–10506) **Dual Shell Pressure Balanced Reactor Vessel cooperative research and development agreement with Innotek, Inc., Final report.** Robertus, R.J.; Fassbender, A.G.; Deverman, G.S. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95010720. Source: OSTI; NTIS; GPO Dep.

The Department of Energy's Office of Energy Research (OER) has provided support for the development of several chemical processes, including supercritical water oxidation, liquefaction, and aqueous hazardous waste destruction, where chemical and phase transformations are conducted at high pressure and temperature. These and many other commercial processes require a pressure vessel capable of operating in a corrosive environment where safety and economy are important requirements. This document details a cooperative research and development agreement for a novel Dual Shell Pressure Balanced Vessel (DSPBV) which could solve a number of these problems. The Technology could be immediately useful in continuing commercialization of an R&D 100 award-winning technology, Sludge-to-oil Reactor System (STORS), originally developed through funding by OER.

21506 (SAND–94-1199C) **Intelligent systems for induction hardening processes.** Kelley, J.B. (and others); Adkins, D.R.; Robino, C.V. Sandia National Labs., Albuquerque, NM (United States). [1994]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9505213–1: International conference on induction hardened gears and precision components, Indianapolis, IN (United States), 15-17 May 1995). Order Number DE95012526. Source: OSTI; NTIS; INIS; GPO Dep.

Induction hardening is widely used to provide enhanced strength, wear resistance, and toughness in components made from medium and high carbon steels. Current limitations of the process include the lack of closed-loop process control, previously unidentified process and material variations which cause continual adjustment of the process parameters, coil and process development by trial and error, and an instability to monitor coil condition. Improvement of the induction hardening process is limited by an inadequate understanding of process fundamentals and material/process interactions. A multidisciplinary team from Sandia National Laboratories and Delphi Saginaw Steering Systems is investigating the induction hardening process under a Cooperative Research and Development Agreement (CRADA). The application of intelligent control algorithms has led to the development of a closed-loop process controller for the combination of one material, one geometry, single frequency, single shot, process that controls to $\pm$ 0.1mm. This controller will be demonstrated on the production floor this year. Our approach and the opportunities for expanding the usefulness of this technology will be described.

21507 (SAND–95-0724) **Prosperity game for the national electronics manufacturing initiative.** Berman, M. (Sandia National Labs., Albuquerque, NM (United States)); VanDevender, J.P.; Berry, I. Sandia National Labs., Albuquerque, NM (United States). May 1995. 205p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95012531. Source: OSTI; NTIS; GPO Dep.

Prosperity Games are an outgrowth and adaptation of move/countermove and seminar War Games. Prosperity Games are simulations that explore complex issues in a variety of areas including economics, politics, sociology, environment, education and research. These issues can be examined from a variety of perspectives ranging from a global, macroeconomic and geopolitical viewpoint down to the details of customer/supplier/market interactions in specific industries. All Prosperity Games are unique in that both the game format and the player contributions vary from game to game. This report documents the Prosperity Game conducted under the sponsorship of the Electronics Subcommittee of the Civilian Industrial Technology Committee (under the National Science and Technology Council), and the Electronics Partnership Project. Players were drawn from the electronics industry, from government, national laboratories, and universities, and from Japan and Austria. The primary objectives of this game were: To connect the technical and non-technical (i.e., policy) issues that were developed in the roadmap-making endeavor of the National Electronics Manufacturing Initiative (NENI);to provide energy, enthusiasm and people to help the roadmap succeed; and to provide insight into high-leverage public and private investments. The deliberations and recommendations of these teams provide valuable insights as to the views of this diverse group of decision makers concerning policy changes, foreign competition, the robustness of strategic thinking and planning, and the development, delivery and commercialization of new technologies.

21508 (UCRL-ID–120612) **Electroless nickel recycling via electrodialysis.** Steffani, C.; Meltzer, M. Lawrence Livermore National Lab., CA (United States). Apr 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95011808. Source: OSTI; NTIS; GPO Dep.

Electroless nickel is widely used in the metal finishing industry as a coating. It plates evenly on a variety of surfaces and replicates or enhances the surface finish. It has high hardness and good corrosion resistance and machinability. However, its bath life is limited and it has a tendency to spontaneously plate out on the tank and associated equipment. These problems add to the cost per unit component plated. Also, expensive waste treatment is required before users can dispose of the spent solution. Electroless nickel's limited bath life is inherent in its chemical make-up. Using hypophosphite as the reducing agent for the nickel ion generates by-products of nickel metal and orthophosphite. When the level of orthophosphite in the solution reaches a high concentration, the reaction slows and finally stops. The bath must be disposed of, and its treatment and replacement costs are high. Metal salts have a tendency to plate out because of the dissolved solids present, and this also makes it necessary to discard the bath. Lawrence Livermore National Laboratory (LLNL) has conducted a study of an electrodialysis process that can reduce both chemical purchases and disposal costs. Electrodialysis employs a membrane, deionized water, and an electromotive potential to separate the orthophosphite and other dissolved solids from the nickel ions. With the aid of the electromotive potential, the dissolved solids migrate across the membrane from the process solution into the water in the recycling unit's holding cell. This migration lowers the total dissolved solids (TDS) in the process solution and improves plating performance. The dialysis process makes it possible to reuse the bath many times without disposal.

21509 (UCRL-JC–119135) **Real-time cleaning performance feedback.** Meltzer, M. Lawrence Livermore National Lab., CA (United States). Dec 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950295–1: National electronic packaging and production conference, Anaheim, CA (United States), 26 Feb - 2 mar 1995). Order Number DE95012474. Source: OSTI; NTIS; GPO Dep.

Monitoring contamination levels on parts during cleaning operations will provide feedback that can be useful in reducing waste generation and air emissions caused by over- or under-cleaning. Such real-time process controls can help eliminate pollution in a wide variety of industries, including aerospace, electronics, and metal finishing.

21510 (VTT-PUB–219) **Methodology for simultaneous robot system safety design.** Kuivanen, R. (VTT Manufacturing Technology, Espoo (Finland). Safety Engineering). Technical Research Centre of Finland, Espoo (Finland); Tampere Univ. of Technology (Finland). 1995. 158p. Order Number DE95779235. Source: OSTI; NTIS.

The design of a production system is a challenging and varied task. The designer of a robot system must realize that a technical solution alone cannot create a safe and effective workplace for people. Industrial robots represent a high degree of automation. The design of robot systems can offer examples for many other

manufacturing systems. This study was done from the point of view of the designer. It concentrates on a narrow design task in order to give the operators of the system a workplace that is as good and sensible, as productive, and as safe as possible. The central objective of this study was to present a simultaneous methodology for the safety design of an industrial robot system. A second objective was to evaluate the results of preliminary safety analyses based on the computer models of robot systems in comparison to the safety analyses of the actual robot systems built. The decisions made by designers and the robot user concerning the safety level and production were evaluated, and the recommendations of robot safety standards were tested under realistic conditions simulated in the laboratory.

21511 (DOE/EA–0980) **300 Area process sewer piping upgrade and 300 Area treated effluent disposal facility discharge to the City of Richland Sewage System, Hanford Site, Richland, Washington.** USDOE Richland Operations Office, WA (United States). May 1995. 65p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012961. Source: OSTI; NTIS; GPO Dep.

The U.S. Department of Energy (DOE) is proposing to upgrade the existing 300 Area Process Sewer System by constructing and operating a new process sewer collection system that would discharge to the 300 Area Treated Effluent Disposal Facility. The DOE is also considering the construction of a tie-line from the TEDF to the 300 Area Sanitary Sewer for discharging the process wastewater to the City of Richland Sewage System. The proposed action is needed because the integrity of the old piping in the existing 300 Area Process Sewer System is questionable and effluents might be entering the soil column from leaking pipes. In addition, the DOE has identified a need to reduce anticipated operating costs at the new TEDF. The 300 Area Process Sewer Piping Upgrade (Project L-070) is estimated to cost approximately $9.9 million. The proposed work would involve the construction and operation of a new process sewer collection system. The new system would discharge the effluents to a collection sump and lift station for the TEDF. The TEDF is designed to treat and discharge the process effluent to the Columbia River. The process waste liquid effluent is currently well below the DOE requirements for radiological secondary containment and is not considered a RCRA hazardous waste or a State of Washington Hazardous Waste Management Act dangerous waste. A National Pollutant Discharge Elimination, System (NPDES) permit has been obtained from the U.S. Environmental Protection Agency for discharge to the Columbia River. The proposed action would upgrade the existing 300 Area Process Sewer System by the construction and operation of a new combined gravity, vacuum, and pressurized process sewer collection system consisting of vacuum collection sumps, pressure pump stations, and buried polyvinyl chloride or similar pipe. Two buildings would also be built to house a main collection station and a satellite collection station.

21512 (LUTMDN-TMVK–5247) **Ouje-Bougoumou district heating study. Trouble shooting and overall system performance.** Gamstedt, Y.; Hansson, M. Lund Univ. (Sweden). Dept. of Heat and Power Engineering. Mar 1995. 116p. Order Number DE95779301. Source: OSTI; NTIS.

Examination paper.

The subject for this Master's Thesis is the operation and performance of a small district heating system situated in Ouje-Bougoumou, a native community in the middle of Quebec in Canada. Reasons to perform the study were that deficiencies in the system had been noted in form of higher flow rates and smaller temperature differentials than designed for along with an insufficient supply of district heating to the customers. A monitoring system that registers pressures, temperatures and flow rates in selected points in the district heating system has been developed and installed. An inventory of substations has been done. Information from the monitoring system and the substation inventory has then been used to trouble shoot the system and to evaluate the overall system performance. The result of the study is that an important reason for the dysfunctions in the system is the faulty setting of control valves in substations along with a building internal heating system demanding more flow from the district heating system than designed for. Also the sensors belonging to the faulty set control valves were found to be installed in a faulty position, thereby creating a domestic hot water scalding risk. To transfer well known technology between continents and societies with different social structures is a complicated process. The problems that have occurred in the district heating system in Ouje-Bougoumou quite surely refer to difficulties in this technology transfer process. Refs, 12 figs, 6 tabs, 9 appendices

21513 (LUTMDN-TMVK–5250) **Status assessment of secondary district heating networks.** Aakesson, S.J. Lund Univ. (Sweden). Dept. of Heat and Power Engineering. May 1995. 77p. (In Swedish). Order Number DE95779300. Source: OSTI; NTIS.

Examination paper.

Housing co-operatives in residential areas in Sweden are showing an increased interest in letting the Swedish district heating companies take over their district heating systems. The reason for this is that these district heating piping systems have reached an age where defaults and damages are or are about to become very costly. If the district heating company is to take over the network, the status of the network must be properly assessed to enable an estimation of the remaining (economic) life and to make a correct pricing of the take-over possible. The differences between primary and secondary district heating networks are described, and so are the damages on different parts of the network that may occur. An overview of the most commonly used culvert types is given and furthermore, a model to determine the status of a secondary net is presented. In this model, suggestions for how to describe the heating net are being made and an account of available tools/testing methods which are able to find damages on district heating pipes is given. The study shows that it is difficult to determine the status of the nets, since information about design, construction and maintenance is often limited. This means that when investigating the heating net, you must start with making a thorough description of the design and what has happened during the operation of the net so far. With good knowledge about the net, the continuing study of the net and the selection among available testing methods are made easier. Among the described testing methods that detect and locate leaks, the heat camera and the trace gas give the best results. 21 refs, 7 figs, 4 tabs

21514 (NEI-DK–2049) **District heating. 'Dig-It-Yourself'.** Soerensen, P.A.; Roehr Jensen, J.; Nielsen, U. PlanEnergi S/I (Denmark); Nellemann, Nielsen og Raunschenberger A/S, Alleroed (Denmark); Plastconsult, Randers (Denmark). Mar 1995. 38p. (In Danish). Contract ENS-51191-92.0068. Order Number DE95787756. Source: OSTI; NTIS.

District heating distribution networks in rural areas are normally expensive to construct. In Denmark plastic pipes, in long segments, are now used and various new equipment has been developed for digging them down in the earth. But the price of laying plastic pipes is still the same as for laying plastic ones. It is suggested that a cheap and effective method would be to use a simple drain-spade and a rounded shovel and dig them down by hand, as they should not be buried very deep in the soil. Thus the shovel could be used to remove mud, and the drain-spade for digging and for cleaning up the trench. The earth dug out could be used for filling up the trench again after the pipes have been laid. The earth over the pipes would be 30 cm deep. After the first pipe is laid the earth is filled in so that it is covered with soil up to 20 cm in depth which is then leveled with the help of a water hose. The next pipe is then laid, the dug-out material is used for filling and is stamped down. A warning tape is laid 50 mm over the top of the pipe, the covering is then raised ca.50 mm to give room for the first placing. This more flexible method makes it easier to lay district heating pipes on private grounds. Ground-owners could also do it themselves, it is suggested, whilst still keeping to the standard regulations. 3000 Tax free Danish kroner could be saved in relation to 3 hours manual labour, if this method is used. Hybrid solutions, where other means of laying pipes are combined with the 'Dig-It Yourself' method could save 50% of previous costs. (AB)

21515 (NEI-NO–569, pp. 7-15) **Modelling of municipal solid waste devolatilization: TGA results on the components of MSW and comparison to the TGA behavior of pine.** Krieger-Brockett, B. (Washington Univ. Dept. of Chemical Engineering, Seattle, WA (United States)); Lai, Wei-chuan. Nordisk Ministerraad. 1993. (CONF-9308267–: Nordic seminar on biomass gasification and combustion, Trondheim (Norway), 30 Aug 1993). In *Nordic seminar on biomass gasification and combustion.* 322p. Order Number DE95779284. Source: OSTI; NTIS.

Sponsored by: NTH. Division of Thermal Energy and Nordic Council of Ministers.

Mathematical modelling and experimental results regarding the devolatilization of lodgepole pine, municipal solid waste (MSW) and large particles of densified refuse-derived fuel (d-RDF) have been investigated previously. In this paper, the authors present new thermogravimetric analysis (TGA) data on several MSW constituents. The TGA data will confirm that it is reasonable to use newsprint kinetic parameters to describe the volatiles release for MSW. Also, a comparison is made between the TGA data for d-RDF or MSW and pine, a species of interest in Scandinavia. This comparison is limited to the lowest heating rate in both studies, 5 degrees C/min. Since both of these substances are considered renewable resources, a comparison of their thermal devolatilization behavior in small and large particles is of interest for developing well-designed gasifiers and combustors. 17 refs., 3 figs.

The IEA Bioenergy Agreement 1992-1994 contains four different tasks. Fifteen countries have now signed the agreement. Task X conversion consists of nine different activities each run by an activity leader. An overview of the biomass gasification activity is presented. In the agreement 1992-1994 there are nine countries participating in this particular activity. The means are information exchange, workshops, site visits, and continued focus on gasifier operation and improvements, and scale up. 4 figs., 7 tabs.

Sponsored by: NTH. Division of Thermal Energy and Nordic Council of Ministers.

The Biomass Thermal Gasification Project was started in late 1989 as Activity 4 of the IEA Bioenergy Agreement Task 7, Biomass Conversion. This paper reviews the project activities since its beginning, addressing biomass resources, state-of-the-art gasification technology, research needs, and the future project activities that are especially relevant to the nine (9) participating countries: Canada, Denmark, Finland, Italy, The Netherlands, Sweden, Switzerland, the United Kingdom, and the United States of America. 14 refs.

21519 (NREL/TP–463-7844) **Distributed utility technology cost, performance, and environmental characteristics.** Wan, Y.; Adelman, S. National Renewable Energy Lab., Golden, CO (United States). Jun 1995. 87p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95009234. Source: OSTI; NTIS; GPO Dep.

Distributed Utility (DU) is an emerging concept in which modular generation and storage technologies sited near customer loads in distribution systems and specifically targeted demand-side management programs are used to supplement conventional central station generation plants to meet customer energy service needs. Research has shown that implementation of the DU concept could provide substantial benefits to utilities. This report summarizes the cost, performance, and environmental and siting characteristics of existing and emerging modular generation and storage technologies that are applicable under the DU concept. It is intended to be a practical reference guide for utility planners and engineers seeking information on DU technology options. This work was funded by the Office of Utility Technologies of the US Department of Energy.

21520 (ORNL/CON–401) **Measuring persistence: A literature review focusing on methodological issues.** Wolfe, A.K.; Brown, M.A.; Trumble, D. Oak Ridge National Lab., TN (United States). Mar 1995. 75p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95011772. Source: OSTI; NTIS; GPO Dep.

This literature review was conducted as part of a larger project to produce a handbook on the measurement of persistence. The past decade has marked the development of the concept of persistence and a growing recognition that the long-term impacts of demand-side management (DSM) programs warrant careful assessment. Although increasing attention has been paid to the topic of persistence, no clear consensus has emerged either about its definition or about the methods most appropriate for its measurement and analysis. This project strives to fill that gap by reviewing the goals, terminology, and methods of past persistence studies. It was conducted from the perspective of a utility that seeks to acquire demand-side resources and is interested in their long-term durability; it was not conducted from the perspective of the individual consumer. Over 30 persistence studies, articles, and protocols were examined for this report. The review begins by discussing the underpinnings of persistence studies: namely, the definitions of persistence and the purposes of persistence studies. Then. it describes issues relevant to both the collection and analysis of data on the persistence of energy and demand savings. Findings from persistence studies also are summarized. Throughout the review, four studies are used repeatedly to illustrate different methodological and analytical approaches to persistence so that readers can track the data collection. data analysis, and findings of a set of comprehensive studies that represent alternative approaches.

21521 (SAND–94-2340) **Off site demonstrations for MWLID technologies.** Williams, C. (Sandia National Labs., Albuquerque, NM (United States)); Gruebel, R. Sandia National Labs., Albuquerque, NM (United States). Apr 1995. 77p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95011835. Source: OSTI; NTIS; INIS; GPO Dep.

Open demonstrations of technologies developed by the Office of Technology Development's (QTD's) Mixed Waste Landfill Integrated Demonstration (MWLID) should facilitate regulatory acceptance and speed the transfer and commercialization of these technologies. The purpose of the present project is to identify the environmental restoration needs of hazardous waste and/or mixed waste landfill owners within a 25-mile radius of Sandia National Laboratories (SNL). Most municipal landfills that operated prior to the mid-1980s accepted household/commercial hazardous waste and medical waste that included low-level radioactive waste. The locations of hazardous and/or mixed waste landfills within the State of New Mexico were. identified using federal, state, municipal and Native American tribal environmental records. The records reviewed included the US Environmental Protection Agency (EPA) Superfund Program CERCLIS Event/Site listing (which includes tribal records), the New Mexico Environment Department (NMED), Solid Waste Bureau mixed waste landfill database, and the City of

Albuquerque Environmental Health Department landfill database. Tribal envirorunental records are controlled by each tribal government, so each tribal environmental officer and governor was contacted to obtain release of specific site data beyond what is available in the CERCLIS listings.

21522 (ANL/ES/CP–84456) **Future market for ceramics in vehicle engines and their impacts.** Vyas, A. (Argonne National Lab., IL (United States). Center for Transportation Research); Hanson, D.; Stodolsky, F. Argonne National Lab., IL (United States). Feb 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950186–1: 2. world car conference, Riverside, CA (United States), 22-24 Jan 1995). Order Number DE95012403. Source: OSTI; NTIS; GPO Dep.

Ceramic engine components have potential to improve vehicle fuel economy. Some recent tests have also shown their environmental benefits, particularly in reducing particulate emissions in heavy-duty diesel engines. The authors used the data from a survey of the US vehicle engine and component manufacturers relating to ceramic engine components to develop a set of market penetration models. The survey identified promising ceramic components and provided data on the timing of achieving introductory shares in light and heavy-duty markets. Some ceramic components will penetrate the market when the pilot-scale costs are reduced to one-fifth of their current values, and many more will enter the market when the costs are reduced to one-tenth of the current values. An ongoing ceramics research program sponsored by the US Department of Energy has the goal of achieving such price reductions. The size and value of the future ceramic components market and the impacts of this market in terms of fuel savings, reduction in carbon dioxide emissions, and potential reduction in other criteria pollutants are presented. The future ceramic components market will be 9 million components worth $29 million within 5 years of introduction and will expand to 692 million components worth $3,484 million within 20 years. The projected annual energy savings are 3.8 trillion Btu by 5 years, increasing to 526 trillion Btu during the twentieth year. These energy savings will reduce carbon dioxide emissions by 41 million tons during the twentieth year. Ceramic components will help reduce particulate emissions by 100 million tons in 2030 and save the nation's urban areas $152 million. The paper presents the analytical approach and discusses other economic impacts.

21523 (CONF-9503150–1) **Thermal barrier coatings issues in advanced land-based gas turbines.** Parks, W.P. (USDOE Office of Industrial Technologies, Washington, DC (United States)); Lee, W.Y.; Wright, I.G. Oak Ridge National Lab., TN (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Thermal barrier coating workshop; Westlake, OH (United States); 27-29 Mar 1995. Order Number DE95012897. Source: OSTI; NTIS; GPO Dep.

The Department of Energy's Advanced Turbine Systems (ATS) program is aimed at fostering the development of a new generation of land-based gas turbine systems with overall efficiencies significantly beyond those of current state-of-the-art machines, as well as greatly increased times between inspection and refurbishment, improved environmental impact, and decreased cost. The proposed duty cycle of ATS machines will emphasize different criteria in the selection of materials for the critical components. In particular, thermal barrier coatings (TBCS) will be an essential feature of the hot gas path components in these machines. In fact, the goals of the ATS will require significant improvements in TBC technology, since these turbines will be totally reliant on TBCs, which will be required to function on critical components such as the first stage vanes and blades for times considerably in excess of those experienced in current applications. Issues that assume increased importance are the mechanical and chemical stability of the ceramic layer and of the metallic bond coat; the thermal expansion characteristics and compliance of the ceramic layer; and the thermal conductivity across the thickness of the ceramic layer. Obviously, the ATS program provides a very challenging opportunity for TBCs, and involves some significant opportunities to extend this technology. A significant TBC development effort is planned in the ATS program which will address these key issues.

21524 (SAND–95-8563C) **The effects of high ambient density on diesel spray penetration and spread.** Naber, J.D.; Siebers, D.L.; Hencken, K.R. Sandia National Labs., Livermore, CA (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract AC04-94AL85000 ; AC04-76DP00789. (CONF-9504163–1: Combustion Institute and American Flame Research onference, San Antonio, TX (United States), 23-26 Apr 1995). Order Number DE95010761. Source: OSTI; NTIS; GPO Dep.

The effects of ambient gas density on diesel spray penetration and spread under (a) non-vaporizing, (b) vaporizing, and (c) combusting conditions were examined. Densities more than a factor of two higher than top-dead-center conditions in current technology diesel engines were considered. The results show that the effects of density on non-vaporizing spray penetration are more significant than previously noted, that vaporization processes decrease penetration and spread, and that combustion processes increase penetration and spread of diesel sprays.

21525 (ANL/ES/CP–84476) **Simple cost model for EV traction motors.** Cuenca, R.M. Argonne National Lab., IL (United States). Feb 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950186–3: 2. world car conference, Riverside, CA (United States), 22-24 Jan 1995). Order Number DE95013371. Source: OSTI; NTIS; GPO Dep.

A simple cost model has been developed that allows the calculation of the OEM cost of electric traction motors of three different types, normalized as a function of power in order to accommodate different power and size. The model includes enough information on the various elements integrated in the motors to allow analysis of individual components and to factor-in the effects of changes in commodities prices. A scalable cost model for each of the main components of an electric vehicle (EV) is a useful tool that can have direct application in computer simulation or in parametric studies. For the cost model to have wide usefulness, it needs to be valid for a range of values of some parameter that determines the magnitude or size of the component. For instance, in the case of batteries, size may be determined by energy capacity, usually expressed in kilowatt-hours (kWh), while in the case of traction motors, size is better determined by rated power, usually expressed in kilowatts (kW). The simplest case is when the cost of the component in question is a direct function of its size; then cost is simply the product of its specific cost ($/unit size) and the number of units (size) in the vehicle in question. Batteries usually fall in this category (cost = energy capacity x $/kWh). But cost is not always linear with size or magnitude; motors (and controllers), for instance, become relatively less expensive as power rating increases. Traction motors, one of the main components for EV powertrains are examined in this paper, and a simplified cost model is developed for the three most popular design variations.

21526 (ANL/ES/CP–85251) **Electric vehicle performance in 1994 DOE competitions.** Quong, S.; Duoba, M.; Larsen, R.; LeBlanc, N.; Gonzales, R.; Buitrago, C. Argonne National Lab., IL (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950256–8: Society of Automotive Engineers international congress and exposition, Detroit, MI (United States), 27 Feb - 2 mar 1995). Order Number DE95012285. Source: OSTI; NTIS; GPO Dep.

The US Department of Energy (DOE) through Argonne National Laboratory sponsored and recorded energy data of electric vehicles (EVs) at five competitions in 1994. Each competition provided different test conditions (closed-track, on-road, and dynamometer). The data gathered at these competitions includes energy efficiency, range, acceleration, and vehicle characteristics. The results of the analysis show that the vehicles performed as expected. Some of the EVs were also tested on dynamometers and compared to gasoline vehicles, including production vehicles with advanced battery systems. Although the EVs performed well at these competitions, the results show that only the vehicles with advanced technologies perform as well or better than conventional gasoline vehicles.

21529 (ANL/ES/CP–85263) **Technical analysis of the 1994 HEV challenge.** LeBlanc, N.M.; Duoba, M.; Quong, S.; Larsen, R.P.; Stithim, M.; Rimkus, W. Argonne National Lab., IL (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950256–9: Society of Automotive Engineers international congress and exposition, Detroit, MI (United States), 27 Feb - 2 mar 1995). Order Number DE95012933. Source: OSTI; NTIS; GPO Dep.

The 1994 Hybrid Electric Vehicle Challenge provided the backdrop for collecting data and developing testing procedures for hybrid electric vehicle technology available at colleges and universities across North America. The data collected at the competition was analyzed using the HEV definitions from the draft SAE J1711 guidelines. The energy economy, percentage of electrical to total energy used, and acceleration performance was analyzed for any correlation between the over-the-road data and the commuter-sustaining, commuter-depleting, and reserve-sustaining hybrid vehicles. The analysis did not provide any direct correlation between over-the-road data and the three hybrid types. The analysis did show that the vehicle configurations provide the best information on vehicle performance. It was also clear that a comprehensive data analysis system along with a well-defined testing procedure would allow for a more complete analysis of the data.

21530 (ANL/ES/CP–85350) **Testing hybrid electric vehicle emissions and fuel economy at the 1994 Hybrid Electric Vehicle Challenge.** Duoba, M.; Quong, S.; LeBlanc, N.; Larsen, R.P. Argonne National Lab., IL (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950256–7: Society of Automotive Engineers international congress and exposition, Detroit, MI (United States), 27 Feb - 2 mar 1995). Order Number DE95012468. Source: OSTI; NTIS; GPO Dep.

From June 12–20, 1994, an engineering design competition called the 1994 Hybrid Electric Vehicle (HEV) Challenge was held in Southfield, Michigan. This collegiate-level competition, which involved 36 colleges and universities from across North America, challenged the teams to build a superior HEV. One component of this comprehensive competition was the emissions event. Special HEV testing procedures were developed for the competition to find vehicle emissions and correct for battery state-of-charge while fitting into event time constraints. Although there were some problems with a newly-developed data acquisition system, they were able to get a full profile of the best performing vehicles as well as other vehicles that represent typical levels of performance from the rest of the field. This paper will explain the novel test procedures, present the emissions and fuel economy results, and provide analysis of second-by-second data for several vehicles.

21531 (UCRL-JC–120151) **Hybrid vehicle system studies and optimized hydrogen engine design.** Smith, J.R.; Aceves, S. Lawrence Livermore National Lab., CA (United States). 26 Apr 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9504160–3: 1995 DOE/NREL hydrogen program review, Coral Gables, FL (United States), 18-21 Apr 1995). Order Number DE95013438. Source: OSTI; NTIS; GPO Dep.

We have done system studies of series hydrogen hybrid automobiles that approach the PNGV design goal of 34 km/liter (80 mpg), for 384 km (240 mi) and 608 km (380 mi) ranges. Our results indicate that such a vehicle appears feasible using an optimized hydrogen engine. We have evaluated the impact of various on-board storage options on fuel economy. Experiments in an available engine at the Sandia CRF demonstrated NO_x emissions of 10 to 20 ppm at an equivalence ratio of 0.4, rising to about 500 ppm at 0.5 equivalence ratio using neat hydrogen. Hybrid simulation studies indicate that exhaust NO_x concentrations must be less than 180 ppm to meet the 0.2 g/mile ULEV or Federal Tier II emissions regulations. LLNL has designed and fabricated a first generation optimized hydrogen engine head for use on an existing Onan engine. This head features 15:1 compression ratio, dual ignition, water cooling, two valves and open quiescent combustion chamber to minimize heat transfer losses. Initial testing shows promise of achieving an indicated efficiency of nearly 50% and emissions of less than 100 ppm NO_x. Hydrocarbons and CO are to be measured, but are expected to be very low since their only source is engine lubricating oil. A successful friction reduction program on the Onan engine should result in a brake thermal efficiency of about 42% compared to today's gasoline engines of 32%. Based on system studies requirements, the next generation engine will be about 2 liter displacement and is projected to achieve 46% brake thermal efficiency with outputs of 15 kW for cruise and 40 kW for hill climb.

3306 Vehicle Design Factors

21532 (ANL/ES/CP–84474) **Lightweight materials in the light-duty passenger vehicle market: Their market penetration potential and impacts.** Stodolsky, F. (Argonne National Lab., IL (United States). Center for Transportation Research); Vyas, A.; Cuenca, R. Argonne National Lab., IL (United States). [1995]. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950186–2: 2. world car conference, Riverside, CA (United States), 22-24 Jan 1995). Order Number DE95012462. Source: OSTI; NTIS; GPO Dep.

This paper summarizes the results of a lightweight materials study. Various lightweight materials are examined and the most cost effective are selected for further analysis. Aluminum and high-performance polymer matrix composites (PMCS) are found to have the highest potential for reducing the weight of automobiles and passenger-oriented light trucks. Weight reduction potential for aluminum and carbon fiber-based PMCs are computed based on a set of component-specific replacement criteria (such as stiffness and strength), and the consequent incremental cost scenarios are developed. The authors assume that a materials R and D program successfully reduces the cost of manufacturing aluminum and carbon fiber PMC-intensive vehicles. A vehicle choice model is used to project market shares for the lightweight vehicles. A vehicle survival and age-related usage model is employed to compute energy

consumption over time for the vehicle stock. After a review of projected costs, the following two sets of vehicles are characterized to compete with the conventional materials vehicles: (1) aluminum vehicles with limited replacement providing 19% weight reduction (AIV-Mid), and (2) aluminum vehicles with the maximum replacement providing 31% weight reduction (AIV-Max). Assuming mass-market introduction in 2005, the authors project a national petroleum energy savings of 3% for AIV-Mid and 5% for AIV-Max in 2030.

21533 (ANL/ES/CP–85239) **Modeling the effect of engine assembly mass on engine friction and vehicle fuel economy.** An, Feng (University of California, Riverside, CA (United States)); Stodolsky, F. Argonne National Lab., IL (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950256–10: Society of Automotive Engineers international congress and exposition, Detroit, MI (United States), 27 Feb - 2 mar 1995). Order Number DE95012936. Source: OSTI; NTIS; GPO Dep.

In this paper, an analytical model is developed to estimate the impact of reducing engine assembly mass (the term engine assembly refers to the moving components of the engine system, including crankshafts, valve train, pistons, and connecting rods) on engine friction and vehicle fuel economy. The relative changes in frictional mean effective pressure and fuel economy are proportional to the relative change in assembly mass. These changes increase rapidly as engine speed increases. Based on the model, a 25% reduction in engine assembly mass results in a 2% fuel economy improvement for a typical mid-size passenger car over the EPA Urban and Highway Driving Cycles.

21534 (CONF-950892–6) **Al_2O_3/CeO_2 Washcoats for three-way automotive emission catalysts.** Kenik, E.A. (Oak Ridge National Lab., TN (United States)); More, K.L.; LaBarge, W.; Beckmeyer, R. Oak Ridge National Lab., TN (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 53. annual meeting of Microscopy Society of America; Kansas City, KS (United States); 13-17 Aug 1995. Order Number DE95012894. Source: OSTI; NTIS; GPO Dep.

Pt-Rh based three-way catalysts are the primary catalytic system for control of hydrocarbon, CO, and NO_x automotive emissions. Mixed Al_2O_3/CeO_2 oxides are often dispersed on a cordierite honeycomb monolith as a washcoat and act as a high-surface-area carrier for the heavy metal catalyst clusters. Conversion efficiency and lifetime of a converter is determined by the microstructure of the washcoat/monolith and its evolution during high-temperature exposure to the exhaust gas. SEM, electron microprobe analysis, and analytical electron microscopy were used to study these catalysts before and after engine dynamometer tests, with max monolith temperatures of 1000 and 1150 C.

21535 (SAND–95-8522C) **Development of a method for in-cylinder tracking of a fuel additive for NO_x control.** Dec, J.E. (Sandia National Labs., Livermore, CA (United States)); Espey, C. Sandia National Labs., Livermore, CA (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9410309–3: Contractor's coordination meeting, Dearborn, MI (United States), 24-27 Oct 1994). Order Number DE95010752. Source: OSTI; NTIS; GPO Dep.

The development of a NO_x-reducing fuel additive for diesel engines offers a potentially superior alternative to more classic NO_x reduction techniques. A key element in making this additive work successfully is to make it survive until late in the combustion event. To help guide the development of the additive, a technique for measuring the evolution of the additive distribution in the combusting fuel jet of an operating diesel engine is proposed and investigated. This proposed technique is based on planar laser-induced fluorescence (PLIF) imaging in an optically accessible diesel engine. The induced fluorescence must be unique to the additive, and it could arise from either the additive itself or from a hydrocarbon complex (fluorescent tag) attached to the additive molecule. Using a luminescence spectrometer, a fluorescent emission from the base additive (Texaco's batch no. 40725-6) was identified that is unique from any fuel fluorescence and out of the typical range of poly-aromatic hydrocarbon (PAH) fluorescence. Then, preliminary PLIF images were obtained in the firing engine to determine whether this fluorescence emission can be used to track the evolution of the additive distribution. Temporal sequences of these preliminary PLIF images obtained with and without the additive in the fuel are presented. Problems with interference from PAH fluorescence and steps taken to mitigate the problem are presented and discussed. However, a fundamental problem is identified in using the natural fluorescence signal from this particular additive formulation to track the breakdown of the additive shell and the release of the active component in the cylinder of the engine. Alternative methods of achieving the desired results are discussed.

This report describes the use of natural gas as an alternative fuel in various vehicles. Safety and emissions resulting from combustion are briefly discussed.

21537 (ANL/ES/PP–79436) **Emissions from ethanol- and LPG-fueled vehicles.** Pitstick, M.E. Argonne National Lab., IL (United States). [1995]. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95012214. Source: OSTI; NTIS; INIS; GPO Dep.

This paper addresses the environmental concerns of using neat ethanol and liquefied petroleum gas (LPG) as transportation fuels in the United States. Low-level blends of ethanol (10%) with gasoline have been used as fuels in the United States for more than a decade, but neat ethanol (85% or more) has only been used extensively in Brazil. LPG, which consists mostly of propane, is already used extensively as a vehicle fuel in the United States, but its use has been limited primarily to converted fleet vehicles. Increasing U.S. interest in alternative fuels has raised the possibility of introducing neat-ethanol vehicles into the market and expanding the number of LPG vehicles. Use of such vehicles, and increased production and consumption of fuel ethanol and LPG, will undoubtedly have environmental impacts. If the impacts are determined to be severe, they could act as barriers to the introduction of neat-ethanol and LPG vehicles. Environmental concerns include exhaust and evaporative emissions and their impact on ozone formation and global warming, toxic emissions from fuel combustion and evaporation, and agricultural impacts from production of ethanol. The paper is not intended to be judgmental regarding the overall attractiveness of ethanol or LPG as compared with other transportation fuels. The environmental concerns are reviewed and summarized, but only conclusion reached is that there is no single concern that is likely to prevent the introduction of neat-ethanol-fueled vehicles or the increase in LPG-fueled vehicles.

21538 (NREL/TP–425-7529) **Advanced hydrogen/methanol utilization technology demonstration. Phase II: Hydrogen cold start of a methanol vehicle.** National Renewable Energy Lab., Golden, CO (United States); Hydrogen Consultants, Inc., Littleton, CO (United States). May 1995. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95004092. Source: OSTI; NTIS; GPO Dep.

This is the Phase 11 Final Report on NREL Subcontract No. XR-2-11175-1 "Advanced Hydrogen/Methane Utilization Demonstration" between the National Renewable Energy Laboratory (NREL), Alternative Fuels Utilization Program, Golden, Colorado and Hydrogen Consultants, Inc. (HCI), Littleton, Colorado. Mr.

Chris Colucci was NREL's Technical Monitor. Colorado State University's (CSU) Engines and Energy Conversion Laboratory was HCI's subcontractor. Some of the vehicle test work was carried out at the National Center for Vehicle Emissions Control and Safety (NCVECS) at CSU. The collaboration of the Colorado School of Mines is also gratefully acknowledged. Hydrogen is unique among alternative fuels in its ability to burn over a wide range of mixtures in air with no carbon-related combustion products. Hydrogen also has the ability to burn on a catalyst, starting from room temperature. Hydrogen can be made from a variety of renewable energy resources and is expected to become a widely used energy carrier in the sustainable energy system of the future. One way to make a start toward widespread use of hydrogen in the energy system is to use it sparingly with other alternative fuels. The Phase I work showed that strong affects could be achieved with dilute concentrations of hydrogen in methane (11). Reductions in emissions greater than the proportion of hydrogen in the fuel provide a form of leverage to stimulate the early introduction of hydrogen. Per energy unit or per dollar of hydrogen, a greater benefit is derived than simply displacing fossil-fueled vehicles with pure hydrogen vehicles.

21539 (NREL/TP–425-7609) **Development of an ultra-safe, ultra-low emissions natural gas-fueled bus. Phase 1: Systems design – Final report.** Kubesh, J. (Southwest Research Inst., San Antonio, TX (United States)). National Renewable Energy Lab., Golden, CO (United States); Southwest Research Inst., San Antonio, TX (United States). May 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95009226. Source: OSTI; NTIS; GPO Dep.

The National Renewable Energy Laboratory (NREL) contracted with Southwest Research Institute (SwRI) to develop an ultra-safe, ultra-low emissions natural gas-fueled school bus. To develop the bus, SwRI teamed with Blue Bird, Incorporated, a school bus manufacturer, Deere Power Systems Group, an engine manufacturer, and CNG Cylinder Company, a supplier of compressed natural gas storage and handling systems. The primary focus of work for Phase 1 was the design of the component systems, i.e. vehicle, engine, and fuel storage systems. The bus chassis prototype is expected to be completed by the middle of July, 1995. A complete prototype vehicle body and chassis should be delivered to SwRI by the beginning of December, 1995. This prototype vehicle will include the new compressed natural gas cylinders and associated fuel storage system hardware which has been designed by CNG Cylinder Company.

35 ARMS CONTROL

3501 Policy, Negotiations, and Legislation

21540 (ANL/DIS/CP–85862) **A comparison of national compliance legislation under the chemical weapons convention.** Tanzman, E.A. Argonne National Lab., IL (United States). 3 Mar 1995. 6p. Sponsored by USDOE, Washington, DC (United States);Argonne National Lab., IL (United States). DOE Contract W-31109-ENG-38. Contract DNA001-90-C-0177. (CONF-9503143–1: Compliance systems for disarmament treaties: a workshop on the promotion and enforcement of international law, Toronto (Canada), 3 Mar 1995). Order Number DE95011796. Source: OSTI; NTIS; GPO Dep.

The Chemical Weapons Convention (CWC) is unique among multilateral arms control agreements in requiring national compliance legislation. This paper discusses the compliance legislation enacted by Australia, Germany, Norway, South Africa, and Sweden in anticipation of this agreement entering into force. It compares how these five nations addressed the requirement for legislation to penalize violations of the Convention, as well as how they have developed legal mechanisms to acquire the information about dual-use chemicals that must be declared to the Organisation for the Prohibition of Chemical Weapons. This analysis shows that although different options exist to meet these treaty requirements, areas of consistency between nations are emerging that will encourage universal compliance as the regime matures.

21541 (ANL/DIS/CP–86454) **Legal aspects of national implementation of the chemical wseapons convention confidential provisions.** Tanzman, E.A.; Kellman, B. Argonne National Lab., IL (United States). 9 May 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9505207–2: Regional seminar on the national implementation of the chemical weapons convention, Yamoussoukro (South Africa), 9 May 1995). Order Number DE95011843. Source: OSTI; NTIS; GPO Dep.

Today, I shall discuss legal aspects of implementing the Chemical Weapons Convention's (CORK) confidentiality provisions. These implementing measures are universal, applying not only to the few States Parties that will declare and destroy chemical weapons, but also to the many States Parties that have never had a chemical weapons program. Progress is reported in actually developing implementing measures for the cork's confidentiality requirements from Australia, Germany, Norway, South Africa, and Sweden.

21542 (ANL/DIS/CP–86455) **Legal aspects of national implementation of the Chemical Weapons Convention transfer provisions.** Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9505207–1: Regional seminar on the national implementation of the chemical weapons convention, Yamoussoukro (South Africa), 9 May 1995). Order Number DE95011844. Source: OSTI; NTIS; INIS; GPO Dep.

The author discusses legal aspects of implementing the Chemical Weapons Convention's (CWC's) export and import provisions. These implementing measures are universal, applying not only to the few States Parties that will declare and destroy chemical weapons, but also to the many States Parties that have never had a chemical weapons program. This new need for national measures to implement multilateral arms control agreements has generated unease due to a perception that implementation may be burdensome and at odds with national law. In 1993, concerns arose that the complexity of integrating the treaty with national law would cause each nation to effectuate the Convention without regard to what other nations were doing, thereby engendering significant disparities in implementation steps among States Parties. As a result, the author and his colleagues prepared the Manual for National Implementation of the Chemical Weapons Convention. The Manual tries to increase understanding of the Convention by identifying its obligations and suggesting methods of meeting them. Here the author discusses progress among several States in actually developing implementing measures for the Convention's transfer requirements. CWC legislation from australia, Germany, Norway, South Africa, and Sweden were available at this writing in English through the Provisional Technical Secretariat. Of course, it is important to note that this brief survey necessarily omitted examination of the existing background of other, related domestic laws that these signatories might also have adopted that affect CWC implementation.

21543 (DOE/EIS–0218D-Summ.) **Proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel. Summary.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Mar 1995. 62p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012336. Source: OSTI; NTIS; INIS; GPO Dep.

The United States Department of Energy and United States Department of State are jointly proposing to adopt a policy to manage spent nuclear fuel from foreign research reactors. Only spent nuclear fuel containing uranium enriched in the United States would be covered by the proposed policy. The purpose of the proposed policy is to promote U.S. nuclear weapons nonproliferation policy objectives, specifically by seeking to reduce highly-enriched uranium from civilian commerce. This is a summary of the Draft Environmental Impact Statement. Environmental effects and policy considerations of three Management Alternative approaches for implementation of the proposed policy are assessed. The three Management Alternatives analyzed are: (1) acceptance and management of the spent nuclear fuel by the Department of Energy in the United States, (2) management of the spent nuclear fuel at one or more foreign facilities (under conditions that satisfy United States nuclear weapons nonproliferation policy objectives), and (3)

a combination of components of Management Alternatives 1 and 2 (Hybrid Alternative). A No Action Alternative is also analyzed. For each Management Alternative, there are a number of alternatives for its implementation. For Management Alternative 1, this document addresses the environmental effects of various implementation alternatives such as varied policy durations, management of various quantities of spent nuclear fuel, and differing financing arrangements. Environmental impacts at various potential ports of entry, along truck and rail transportation routes, at candidate management sites, and for alternate storage technologies are also examined. For Management Alternative 2, this document addresses two subalternatives: (1) assisting foreign nations with storage; and (2) assisting foreign nations with reprocessing of the spent nuclear fuel.

21544 (DOE/EIS–0218D-Vol.1) **Draft Environmental Impact Statement on a proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel. Volume 1.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Mar 1995. 444p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012337. Source: OSTI; NTIS; INIS; GPO Dep.

The United States Department of Energy and United States Department of State are jointly proposing to adopt a policy to manage spent nuclear fuel from foreign research reactors. Only spent nuclear fuel containing uranium enriched in the United States would be covered by the proposed policy. The purpose of the proposed policy is to promote U.S. nuclear weapons nonproliferation policy objectives, specifically by seeking to reduce highly-enriched uranium from civilian commerce. Environmental effects and policy considerations of three Management Alternative approaches for implementation of the proposed policy are assessed. The three Management Alternatives analyzed are: (1) acceptance and management of the spent nuclear fuel by the Department of Energy in the United States, (2) management of the spent nuclear fuel at one or more foreign facilities (under conditions that satisfy United States nuclear weapons nonproliferation policy objectives), and (3) a combination of components of Management Alternatives 1 and 2 (Hybrid Alternative). A No Action Alternative is also analyzed. For each Management Alternative, there are a number of alternatives for its implementation. For Management Alternative 1, this document addresses the environmental effects of various implementation alternatives such as varied policy durations, management of various quantities of spent nuclear fuel, and differing financing arrangements. Environmental impacts at various potential ports of entry, along truck and rail transportation routes, at candidate management sites, and for alternate storage technologies are also examined. For Management Alternative 2, this document addresses two subalternatives: (1) assisting foreign nations with storage; and (2) assisting foreign nations with reprocessing of the spent nuclear fuel. Management Alternative 3 analyzes a hybrid alternative. This document is Vol. 1 of 2 plus summary volume.

21545 (DOE/EIS–0218D-Vol.2-App.A) **Proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel: Appendix A, environmental justice analysis. Volume 2.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Mar 1995. 50p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012338. Source: OSTI; NTIS; INIS; GPO Dep.

This is Appendix A to a draft Environmental Impact Statement on a Proposed Nuclear Weapons Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel. This appendix addresses environmental justice for the acceptance of foreign research reactor spent nuclear fuel containing uranium enriched in the United States. Analyses of environmental justice concerns are provided in three areas: (1) potential ports of entry, (2) potential transportation routes from candidate ports of entry to interim management sites, and (3) areas surrounding potential interim management sites. These analyses lead to the conclusion that the alternatives analyzed in this Environmental Impact Statement (EIS) would result in no disproportionate adverse effects on minority populations or low-income communities surrounding the candidate ports, transport routes, or interim management sites.

21546 (DOE/EIS–0218D-Vol.2-App.B) **Proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel: Appendix B, foreign research reactor spent nuclear fuel characteristics and transportation casks. Volume 2.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Mar 1995. 61p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012339. Source: OSTI; NTIS; INIS; GPO Dep.

This is Appendix B of a draft Environmental Impact Statement (EIS) on a Proposed Nuclear Weapons Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel. It discusses relevant characterization and other information of foreign research reactor spent nuclear fuel that could be managed under the proposed action. It also discusses regulations for the transport of radioactive materials and the design of spent fuel casks.

21547 (DOE/EIS–0218D-Vol.2-App.C) **Proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel: Appendix C, marine transport and associated environmental impacts. Volume 2.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Mar 1995. 43p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012340. Source: OSTI; NTIS; INIS; GPO Dep.

This is Appendix C to a Draft Environmental Statement on a Proposed Nuclear Weapon Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel. Shipment of any material via ocean transport entails risks to both the ship's crew and the environment. The risks result directly from transportation-related accidents and, in the case of radioactive or other hazardous materials, also include exposure to the effects of the material itself. This appendix provides a description of the approach used to assess the risks associated with the transport of foreign research reactor spent nuclear fuel from a foreign port to a U.S. port(s) of entry. This appendix also includes a discussion of the shipping configuration of the foreign research reactor spent nuclear fuel, the possible types of vessels that could be used to make the shipments, the risk assessment methodology (addressing both incident-free and accident risks), and the results of the analyses. Analysis of activities in the port(s) is described in Appendix D. The incident-free and accident risk assessment results are presented in terms of the per shipment risk and total risks associated with the basic implementation of Management Alternative 1and other implementation alternatives. In addition, annual risks from incident-free transport are developed.

21548 (DOE/EIS–0218D-Vol.2-App.D) **Proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel: Appendix D, selection and evaluation of potential ports of entry. Volume 2.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Mar 1995. 303p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012341. Source: OSTI; NTIS; INIS; GPO Dep.

This is an appendix to a draft Environmental Impact Statement (EIS) on a proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel. This appendix describes the process used by the Department of Energy in selecting the potential ports of entry analyzed in this EIS. In addition the appendix provides the basic information required to evaluate ports and port activities, and the potential environmental impacts (incident-free and accidents) associated with the receipt and handling of foreign research reactor spent nuclear fuel from vessels to intermodal transport in ports.

21549 (DOE/EIS–0218D-Vol.2-App.E) **Draft environmental impact statement on a proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel: Volume 2, Appendix E, Evaluation of human health effects of overland transportation.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Mar 1995. 228p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012342. Source: OSTI; NTIS; INIS; GPO Dep.

This Appendix provides an overview of the approach used to assess the human health risks that may result from the overland transportation of foreign research reactor spent nuclear fuel. The

Appendix includes discussion of the scope of the assessment, analytical methods used for the risk assessment (i.e., computer models), important assessment assumptions, determination of potential transportation routes, and presents the results of the assessment. In addition, to aid in the understanding and interpretation of the results, specific arm of uncertainty are described, with an emphasis an how the uncertainties may affect comparisons of the alternatives. he approach used in this Appendix is modeled after that used in the Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Draft Environmental Impact Statement (SNF&INEL Draft EIS) (DOE, 1994b). The SNF&INEL Draft EIS did not perform as detailed an analysis on the specific actions taken for foreign research reactor spent nuclear fuel because of the breadth necessary to analyze the entire spent fuel management program. However, the fundamental assumptions used in this analysis are consistent with those used in the SNF & INEL Draft EIS (DOE, 1994b), and the same computer codes and generic release and accident data are used. The risk assessment results are presented in this Appendix in terms of "Per-shipment" risk factors, as well as for the total risks associated with each alternative. Per-shipment risk factors provide an estimate of the risk from a single spent nuclear fuel shipment between a specific origin and destination. They are calculated for all possible origin and destination pairs for each spent nuclear fuel type. The total risks for a given alternative are found by multiplying the expected number of shipments by the appropriate per-shipment risk factors. This approach provides maximum flexibility for determining the risks for a large number of potential alternatives.

21550 (DOE/EIS–0218D-Vol.2-App.G) **Draft environmental impact statement on a proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel: Volume 2, Appendix G, Background documents.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Mar 1995. 21p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012344. Source: OSTI; NTIS; INIS; GPO Dep.

This appendix contains background documents, including a fact sheet, memoranda, and a policy proposal.

21553 (CONF-9404100–) **Proceedings of the symposium on the Non-Proliferation Experiment (NPE): Results and implications for test ban treaties.** Denny, M.D.; Stull, S.P. (eds.). Lawrence Livermore National Lab., CA (United States). [1994]. 599p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. From Symposium on the nonproliferation experiment results and implications for test ban treaties; Rockville, MD (United States); 19-21 Apr 1994. Order Number DE95011413. Source: OSTI; NTIS; GPO Dep.

The large amounts of chemical explosives used worldwide in mining, quarrying, and civil engineering projects presents a challenge for policy makers molding a test ban, since their use could provide the necessary cover for a clandestine nuclear test. The Non-Proliferation Experiment (NPE) seeks to measure certain differences between an underground nuclear test and a chemical explosion in the same geology. Two chemical explosions were detonated at the Nevada Test Site to compare their signatures with previous nuclear tests. This conference presents results of these tests and discusses implications for test ban treaties. Conference papers are divided into the following sections: Background; Test preparations; EOS and code simulations; Rainier Mesa structure; Ground motion measurements; Non-seismic technologies; On-site inspection technologies; and a panel discussion. Selected papers are indexed separately for inclusion in the Energy Science and Technology Database.

21554 (LA–12942-MS) **Comparison of chemical and nuclear explosions: Numerical simulations of the Non-Proliferation Experiment.** Kamm, J.R.; Bos, R.J. Los Alamos National Lab., NM (United States). Jun 1995. 104p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95012989. Source: OSTI; NTIS; GPO Dep.

In this paper the authors discuss numerical simulations of the Non-Proliferation Experiment (NPE), which was an underground explosion conducted in September 1993 in the volcanic tuff of the Nevada Test Site. The NPE source consisted of 1.29×10^6 kg of ANFO-emulsion blasting agent, with the approximate energy of 1.1 kt, emplaced 389 m beneath the surface of Rainier Mesa. The authors compare detailed numerical simulations of the NPE with data collected from that experiment, and with calculations of an equally energetic nuclear explosion in identical geology. Calculated waveforms, at ranges out to approximately 1 km, agree moderately well in the time domain with free-field data, and are in qualitative agreement with free-surface records. Comparison of computed waveforms for equally energetic chemical and nuclear sources reveals relatively minor differences beyond the immediate near-source region, with the chemical source having an ~25% greater seismic moment but otherwise indistinguishable (close-in) seismic source properties. 41 refs., 67 figs., 7 tabs.

21555 (LA-UR–95-1417) **Cooling tower and plume modeling for satellite remote sensing applications.** Powers, B.J. Los Alamos National Lab., NM (United States). [1995]. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95012000. Source: OSTI; NTIS; GPO Dep.

It is often useful in nonproliferation studies to be able to remotely estimate the power generated by a power plant. Such information is indirectly available through an examination of the power dissipated by the plant. Power dissipation is generally accomplished either by transferring the excess heat generated into the atmosphere or into bodies of water. It is the former method with which we are exclusively concerned in this report. We discuss in this report the difficulties associated with such a task. In particular, we primarily address the remote detection of the temperature associated with the condensed water plume emitted from the cooling tower. We find that the effective emissivity of the plume is of fundamental importance for this task. Having examined the dependence of the plume emissivity in several IR bands and with varying liquid water content and droplet size distributions, we conclude that the plume emissivity, and consequently the plume brightness temperature, is dependent upon not only the liquid water content and band, but also upon the droplet size distribution. Finally, we discuss models dependent upon a detailed point-by-point description of the hydrodynamics and thermodynamics of the plume dynamics and those based upon spatially integrated models. We describe in detail a new integral model, the LANL Plume Model, which accounts

for the evolution of the droplet size distribution. Some typical results obtained from this model are discussed.

21556 (SAND–94-3250) **Enhancing regional security agreements through cooperative monitoring.** Pregenzer, A.L. Sandia National Labs., Albuquerque, NM (United States). May 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95013828. Source: OSTI; NTIS; INIS; GPO Dep.

This paper proposes that strengthening regional capabilities for formulating and implementing arms control and confidence-building measures is a tangible method of enhancing regional security. It discusses the importance of developing a regional infrastructure for arms control and confidence building and elucidates the role of technology in facilitating regional arms control and confidence-building agreements. In addition, it identifies numerous applications for regional cooperative monitoring in the areas of arms control, resource management, international commerce and disaster response. The Cooperative Monitoring Center at Sandia National Laboratories, whose aim is to help individual countries and regions acquire the tools they need to develop their own solutions to regional problems, is discussed briefly. The paper ends with recommendations for establishing regional cooperative monitoring centers.

21557 (SAND–95-1191C) **Hypervelocity impact testing of spacecraft optical sensors.** Sandia National Labs., Albuquerque, NM (United States). [1995]. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950846–1: American Physical Society biennial conference on shock compression of condensed matter, Seattle, WA (United States), 13-18 Aug 1995). Order Number DE95013870. Source: OSTI; NTIS; GPO Dep.

Hypervelocity tests of spacecraft optical sensors were conducted to determine if the optical signature from an impact inside the optical sensor sunshade resembled signals that have been observed on-orbit. Impact tests were conducted in darkness and with the ejected debris illuminated. The tests were conducted at the Johnson Space Center Hypervelocity Impact Test Facility. The projectile masses and velocities that may be obtained at the facility are most representative of the hypervelocity particles thought to be responsible for a group of anomalous optical sensors responses that have been observed on-orbit. The projectiles are a few micrograms, slightly more massive than the microgram particles thought to be responsible for the signal source. The test velocities were typically 7.3 km/s, which are somewhat slower than typical space particles.

21558 (UCRL-ID–120931) **The NPE gas tracer test and the development of on-site inspection techniques.** Carrigan, C.; Heinle, R.; Zucca, J.J. Lawrence Livermore National Lab., CA (United States). 13 Apr 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95011693. Source: OSTI; NTIS; GPO Dep.

Tracer gases emplaced in or near the detonation cavity of the 1-kiloton NonProliferation Event required 1.5 and 13.5 months for sulfur hexaflouride and helium-3, respectively, to reach the surface of Rainier Mesa from an emplacement depth of 400 meters. The sites that first produced tracer gases are those located in known faults and fractures. Numerical modeling suggests that transport to the surface is accomplished within this time frame through atmospheric pumping along high permeability pathways such as fractures. The difference in travel time between the two tracers is due to differences in gas diffusivity and can also be explained by our numerical modeling.

21559 (ANL/MSD/CP–86321) **Synthesis, properties, and applications of nanophase materials.** Siegel, R.W. (Max-Planck-Institut fuer Mikrostrukturphysik, Halle/Saale (Germany)). Argonne National Lab., IL (United States). Apr 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9506197–1: International colloquium on plasma processes, Antibes-Juan-les-Pins (France), 11-15 Jun 1995). Order Number DE95013521. Source: OSTI; NTIS; GPO Dep.

Work on the synthesis, properties, and applications of nanophase materials has developed rapidly during the past decade. A wide variety of methods now exist for their production, including several plasma-based processes. The possibilities for engineering new materials with unique or improved properties for a number of applications is now evident from the extant research results. A brief review is presented here along with some examples of useful application areas and some thoughts for the future of this field.

21560 (UCRL-JC–120324) **Analytical and numerical modeling of surface morphologies in thin films.** Genin, F.Y. Lawrence Livermore National Lab., CA (United States). May 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950412–18: Spring meeting of the Materials Research Society (MRS), San Francisco, CA (United States), 17-21 Apr 1995). Order Number DE95014453. Source: OSTI; NTIS; GPO Dep.

Experimental studies have show that strains due to thermal expansion mismatch between a film and its substrate can produce very large stresses in the film that can lead to the formation of holes and hillocks. Based on a phenomenological description of the evolution of a solid surface under both capillary and stress driving forces and for surface and grain boundary self-diffusion, this article provides analytical and numerical solutions for surface profiles of model geometries in polycrystalline thin films. Results can explain a variety of surface morphologies commonly observed experimentally and are discussed to give some practical insights on how to control the growth of holes and hillocks in thin films.

DOE Contract W-31-109-ENG-38. (CONF-9506176–summ.: 19. annual actinide separations conference, Monterey, CA (United States), 12-15 Jun 1995). Order Number DE95013522. Source: OSTI; NTIS; INIS; GPO Dep.

Approximately 2700 metric tons of spent nuclear fuel, representing over 40 years of reactor research and development, has accumulated within the DOE complex. This fuel reflects the varied purposes of DOE reactors and covers a wide range of composition, enrichment, cladding, and chemical reactivity. The varied nature of these fuels complicates their long term disposal. To attempt to individually qualify each type for disposal in a repository would be prohibitively expensive. The electrometallurgical treatment technique, developed by Argonne National Laboratory, is designed to homogenize the wide variety of spent fuel types into a single set of acceptable disposal forms.

21562 (ANL/MSD/CP–83461) **The effect of displacement cascades on small helium bubbles in aluminum and gold.** Donnelly, S.E. (Salford Univ. (United Kingdom)); Valizadeh, R.; Vishnyakov, V.; Birtcher, R.C.; Templier, C. Argonne National Lab., IL (United States). Dec 1994. 7p. Sponsored by USDOE, Washington, DC (United States);North Atlantic Treaty Organization, Brussels (Belgium);Forskningsraadsnaemnden, Stockholm (Sweden). DOE Contract W-31-109-ENG-38. GRANT 910670; GRANT GR/H65320. (CONF-941144–147: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95007137. Source: OSTI; NTIS; GPO Dep.

The evolution of individual helium bubbles in thin foils of gold and aluminum irradiated with 400 keV Ar+ and 200 keV Xe+ has been followed with in-situ transmission electron microscopy for a comparison between the effects of dilute (Al) and dense (Au) collision cascades. Bubble shrinkage in Al has been attributed to direct displacement of the gas out of the bubbles. Effects in Au, include

the disappearance and Brownian motion of bubbles under irradiation, and are consistent with thermal spike processes seen in molecular dynamics simulations.

21563 (ANL/MSD/CP–86106) **Production of defects in metals by collision cascades: TEM experiments.** Kirk, M.A. Argonne National Lab., IL (United States). Mar 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9409349–1: International workshop on an assessment of fundamental aspects of radiation damage production and accumulation in metals and alloys, Obninsk (Russian Federation), 12-18 Sep 1994). Order Number DE95012460. Source: OSTI; NTIS; GPO Dep.

This paper reviews experimental TEM data on production of dislocation loops by low energy ion bombardment to low doses, as simulations of similar collision cascades produced by fast neutron irradiation, in various metals and alloys. The dependence of vacancy dislocation loop formation on recoil energy, sample temperature, and specific metal or alloy will be examined. Special emphasis will be placed on the effects of dilute alloy additions. A model for cascade melting will be employed to understand these effects, and will require an examination of the role of electron-phonon coupling in cascade cooling and recrystallization. The formation of interstitial dislocation loops as cascade defects, and the influence of the nearby surfaces in these experiments is briefly discussed.

21564 (CEA-CONF–11898) **Microstructure and grain boundary sliding influences on intergranular stress corrosion cracking of alloy 600.** Kergaravat, J.F.; Baillin, X. CEA Centre d'Etudes de Grenoble, 38 (France). Dept. d'Etudes des Materiaux. 1994. 2p. (CONF-940766–: 13. international congress on electron microscopy, Paris (France), 17-22 Jul 1994). Order Number DE95630865. Source: OSTI; NTIS (US Sales Only); INIS.

Alloy 600 (NC15Fe) has been used for steam generator tubes of PWR reactors. In primary water, it is sensitive to an Intergranular Stress Corrosion Cracking (IGSCC) which mainly affects areas of high residual stresses. In order to study the influence of microstructure and grain boundary deformation, especially Grain Boundary Sliding (GBS), on IGSCC, specimens with different microstructures have been prepared from industrial alloys. GBS measurements are carried out on strained specimens by SEM with a microgrid technique. Conventional and in situ TEM experiments are proceeded to study the deformation in the grain boundary area and the dislocation/precipitation interactions. (authors). 3 figs.

21565 (CONF-9406335–1) **Patterns and perspectives in applied fracture mechanics.** Merkle, J.G. Oak Ridge National Lab., TN (United States). [1994]. 39p. Sponsored by USDOE, Washington, DC (United States);Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. Agreement 1886-8011-9B. From 26. national symposium on fracture mechanics; Idaho Falls, ID (United States); 28-30 Jun 1994. Order Number DE95012844. Source: OSTI; NTIS; GPO Dep.

This lecture begins with a overview of applied fracture mechanics pertinent to safety of pressure vessels. It then progresses to a chronological panorama of experimental and analytical results. To be useful and dependable in safety analysis of real structures, new analysis developments must be physically realistic, which means that they must accurately describe physical cause and effect. Consequently, before mathematical modeling can begin, cause and effect must be established from experimental data. This can be difficult and time consuming, but worth the effort. Accordingly, the theme of this paper is that the search for patterns is constant and vital. This theme is illustrated by the development of small, single-specimen, fracture toughness testing techniques. It is also illustrated by the development, based on two different published large-strain, elastic-plastic, three-dimensional finite-element analyses, of a hypothesis concerning three-dimensional loss of constraint. When a generalization of Irwin's thickness-normalized plastic-zone parameter, reaches a value close to 2π, the through-thickness contraction strain at the apex of the near-tip logarithmic-spiral slip-line region becomes the dominant negative strain accommodating crack opening. Because slip lines passing from the midplane to the stress-free side surfaces do not have to curve, once these slip lines are established, stresses near the crack tip are only elevated by strain hardening and constraint becomes significantly relaxed. This hypothesis, based on published three-dimensional elastic-plastic analyses, provides a potentially valuable means for gaining additional insight into constraint effects on fracture toughness by considering the roles played by the plastic strains as well as the stresses that develop near a crack tip.

21566 (CONF-9410290–5) **Fracture behavior of bainitic chromium-tungsten and chromium-molybdenum steels.** Klueh, R.L.; Alexander, D.J.; Maziasz, P.J. Oak Ridge National Lab., TN (United States). [1994]. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 36. mechanical working and steel processing conference; Baltimore, MD (United States); Oct 1994. Order Number DE95013206. Source: OSTI; NTIS; GPO Dep.

Bainitic microstructures formed during continuous cooling of low-carbon alloy steels often appear different from classical upper and lower bainite developed by isothermal transformation. The kind of non-classical bainite produced during transformation determines the fracture behavior in a Charpy impact test. Quenching and normalizing treatments of a 3Cr-1.5Mo-0.25V-0.IC steel gave two different bainitic microstructures: a carbide-free acicular structure formed during quenching and a granular bainite formed during normalizing. The superior impact toughness of the quenched steel over the normalized steel was attributed to the difference in microstructure. A similar observation on microstructure was made for a 2.25Cr-2W-0.1C and a 2.25Cr-2W-0.25V-0.IC steel. These observations were used to develop new Cr-W steels with improved strength and impact toughness.

21567 (CONF-941144–154) **Melting, casting, and processing of nickel and iron aluminides.** Sikka, V.K. Oak Ridge National Lab., TN (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1994 fall meeting of the Materials Research Society (MRS); Boston, MA (United States); 28 Nov - 2 dec 1994. Order Number DE95008970. Source: OSTI; NTIS; GPO Dep.

A process for successful melting of Ni_3Al- and Fe_3Al-base alloys is described. Casting and welding of these alloys are also briefly described.

21568 (CONF-941144–158) **Static displacements of atoms in crystalline metallic solid solutions.** Sparks, C. (Oak Ridge National Lab., TN (United States)); Ice, G.; Jiang, X.; Zschack, P. Oak Ridge National Lab., TN (United States). [1994]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1994 fall meeting of the Materials Research Society (MRS); Boston, MA (United States); 28 Nov - 2 dec 1994. Order Number DE95012893. Source: OSTI; NTIS; GPO Dep.

Measurement of diffuse x-ray scattering from binary crystalline solid solutions at more than one x-ray energy is a sensitive probe of the average interatomic distance between neighboring pairs of atoms. Deviations of these bond distances by as little as 0.001 Å are easily detected in the diffuse scattering from binary alloys consisting of atoms nearby in the periodic table and/or where x-ray energies chosen near their absorption edges can change the scattering contrast. Individual bond distances (AA, AB and BB) are recovered out to several near neighbor shells by combining three scattering measurements at x-ray energies chosen for maximum and minimum contrast. Average bond distances recovered from four metal alloys $Fe_{77.5}Ni_{22.5}$, $Fe_{46.5}Ni_{53.5}$, $Cr_{47}Fe_{53}$ and $Cr_{20}Ni_{80}$ are discussed. The authors find that the interatomic distances measured for these alloys give interesting insights to atomic displacements in solid solutions. Nearest neighbor bond distances are not well represented by phenomenological models based on pure element atomic size and concentration dependence of the lattice constants. Radial and nonradial displacements are recovered from these measurements of diffuse scattering.

21569 (CONF-9504168–1) **Embrittlement of austenitic stainless steel welds.** David, S.A.; Vitek, J.M.; Alexander, D.J. Oak Ridge National Lab., TN (United States). [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Department of Energy/Electric Power Research Institute/National Institute of Standards and Technology (DOE/EPRI/NIST) workshop; Charlotte, NC (United States); 11-13

Apr 1995. Order Number DE95013046. Source: OSTI; NTIS; INIS; GPO Dep.

To prevent hot-cracking, austenitic stainless steel welds generally contain a small percent of delta ferrite. Although ferrite has been found to effectively prevent hot-cracking, it can lead to embrittlement of welds when exposed to elevated temperatures. The aging behavior of type-308 stainless steel weld has been examined over a range of temperatures 475–850 C for times up to 10,000 hrs. Upon aging, and depending on the temperature range, the unstable ferrite may undergo a variety of solid state transformations. These phase changes creep-rupture and Charpy impact properties.

21570 (CONF-9507128–1) **On the expansion for surface displacement in the neighborhood of a crack tip.** Gray, L.J. (Oak Ridge National Lab., TN (United States)); Paulino, G.H. Oak Ridge National Lab., TN (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From IABEM '95: international symposium on boundary element methods; No City Given, HI (United States); Jul 1995. Order Number DE95012890. Source: OSTI; NTIS; GPO Dep.

It is shown that in the expansion of the crack opening displacement vs distance from the tip, there is no linear term present. This should lead to improved accuracy of the near tip fields and improved stress intensity factor results. The two-dimensional discussion should be able to be carried over to three dimensions.

21571 (CONF-950892–3) **Ionization delocalization and ALCHEMI of B2-ordered alloys.** Anderson, I.M.; Bentley, J. Oak Ridge National Lab., TN (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States);Oak Ridge Inst. for Science and Education, TN (United States). DOE Contract AC05-84OR21400. From 53. annual meeting of Microscopy Society of America; Kansas City, KS (United States); 13-17 Aug 1995. Order Number DE95012847. Source: OSTI; NTIS; GPO Dep.

Purpose of this paper is to demonstrate that the major assumption underlying the ALCHEMI formulation is justified: that the degree of ionization localization of an elemental shell can be accounted for by a linear coefficient; and to introduce a potential method, which would be applicable to B2-ordered alloys, of independently extracting the ratio of coefficients L_{jk} necessary for delocalization correction. A Cr-doped FeAl alloy and a series of Fe-doped NiAl alloys with 0.25-12 at. % Fe were analyzed. Excellent linearity of the data substantiates the use of linear coefficients to model ionization localization. It was investigated whether the L_{jk} acquired at a (110) systematics orientation could be accurately applied to ALCHEMI data acquired at (200).

21572 (CONF-950892–4) **A systematic ALCHEMI study of Fe-doped NiAl alloys.** Anderson, I.M. (Oak Ridge National Lab., TN (United States)); Bentley, J.; Duncan, A.J. Oak Ridge National Lab., TN (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States);Oak Ridge Inst. for Science and Education, TN (United States). DOE Contract AC05-84OR21400. From 53. annual meeting of Microscopy Society of America; Kansas City, KS (United States); 13-17 Aug 1995. Order Number DE95012848. Source: OSTI; NTIS; GPO Dep.

ALCHEMI site-occupation studies of alloying additions to ordered aluminide intermetallic alloys have been performed with varying degrees of success, depending on the ionization delocalization correction. This study examines the variation in the site-occupancy of Fe in B2-ordered NiAl vs solute concentration and alloy stoichiometry. The fraction of Fe on the 'Ni' site is plotted vs Fe concentration. The good separation among the data from alloys of the three stoichiometries shows that the site occupancy of iron depends on the relative concentrations of the Ni and Al host elements; however a preference for the 'Ni' site is clearly indicated.

21573 (CONF-9509118–5) **Towards predicting weld metal microstructure from fundamentals of transport phenomena.** Mundra, K. (Pennsylvania State Univ., University Park, PA (United States)); DebRoy, T.; Babu, S.S.; David, S.A.; Paul, A.J. Oak Ridge National Lab., TN (United States); Pennsylvania State Univ., University Park, PA (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-84ER45158 ; AC05-84OR21400. From Modeling of casting, welding and advanced solidification processes 7; London (United Kingdom); 10-15 Sep 1995. Order Number DE95012299. Source: OSTI; NTIS; GPO Dep.

Heat transfer and fluid flow during manual metal arc welding Of low alloy steels were investigated by solving the equations of conservation of mass, momentum and energy in three dimensions. Calculated cooling rates were coupled with an existing phase transformation model to predict the microstructure in low alloy steel welds. The computed results were found to be in good agreement with experimentally observed microstructures. The agreement indicates significant promise for predicting spatial distribution of weld metal microstructure from the fundamentals of transport phenomena.

21574 (DOE/ER–45372-8) **Metal-ceramic interfaces: Overlayer-induced reconstruction and magnetism of 4d transition-metal monolayers.** Wu, R.; Freeman, A.J. Northwestern Univ., Evanston, IL (United States). Dept. of Physics and Astronomy. 15 Feb 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER45372. Order Number DE95011543. Source: OSTI; NTIS; GPO Dep.

Structural, electronic, and magnetic properties of metal-ceramic interfaces, M/MgO(001) (M=Pd, Rh, and Ru), have been investigated using the full potential linearized augmented-plane-wave method. Ru and Rh monolayers are found to be able to retain large spin magnetic moments on MgO(001) (1.95 μ_B and 1.21 μ_B for Ru and Ph; respectively) – indicating, in principle, the potential application of MgO(001) as a benign substrate for 4d monolayer magnetism. Significantly, according to our atomic-force determinations, the metal overlayers induce a sizable buckling reconstruction in the interfacial MgO layer, which enhances the M-MgO binding energy by 0.1 eV. The weak M-0 interaction is mainly via tail effects; however, it affects the density of states at the Fermi level for Pd/Mg0(001) significantly and completely eliminates the small magnetic moment of the free Pd monolaver (0.34μ_B).

21575 (DOE/ID/13220–T4) **Magnetically controlled deposition of metals using gas plasma. Quarterly progress report, January–March, 1995.** Idaho Univ., Idaho Falls, ID (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG07-93ID13220. Order Number DE95012414. Source: OSTI; NTIS; GPO Dep.

The objective of the grant is to develop a method of spraying materials on a substrate in a controlled manner to eliminate the waste inherent in present plating processes. The process under consideration is magnetically controlled plasma spraying. The project continues to be on schedule. The field equations have been developed and were reported in the April–June 1994 Progress Report. The equations for the external magnetic field were reported in the July–September 1994 progress report. The field equations have been cast in a format that allows solution using Finite Element (FE) techniques. The development of the computer code that will allow evaluation of the proposed technique and design of an experiment to prove the proposed process is underway. The basic numerical technique was reported in the October–December 1994 progress report, and code development and verification are underway (see Attachment 1).

21576 (DOE/ID/13230–T1) **Advanced precision expendable pattern casting technology. 1994 Summary report.** Alabama Univ., Birmingham, AL (United States). Dept. of Materials Science and Engineering. May 1995. 73p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC07-93ID13230. Order Number DE95012200. Source: OSTI; NTIS; GPO Dep.

Casting technology is described. The following areas are reported on: precision pattern production; pattern coating; sand fill and compaction; pattern gating; mechanical properties; and technology transfer efforts.

21577 (EGG-SE–6683) **Technical development of double-clad process for thin strip casting of carbon steel.** Brown, H.L.; Forkel, C.E.; Knudson, D.L. EG and G Idaho, Inc., Idaho Falls, ID (United States). Aug 1984. 377p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE95011406. Source: OSTI; NTIS; GPO Dep.

This report documents the technical development for a patent disclosure of a double-clad process for the continuous casting of

thin-strip carbon steel. The fundamental idea of the disclosure is to form a product strip by depositing molten steel between two, cooled, clad strips of the same material. The claimed benefits include: (a) the conservation of energy in steel making through the elimination of soaking pits and reheat cycles, and (b) an improved surface on both sides of the as-cast product such that it will be suitable for direct feed to a cold-reduction mill. However, the process as conceived is not necessarily limited to the casting of carbon steel, but may be also applied to other metals and alloys. The work is described under three headings as follows. Preliminary Considerations and Scoping Analysis presents the basic idea of the double-clad, thin-strip casting process; the energy conservation potential; scoping heat transfer calculations for the casting process; and independent review of this work. Thermal Analysis for Roller Configuration of Double-Clad Process, presents the development, results, and independent review of a finite-element thermal analysis for the casting process as originally conceived (using only chilled rollers in direct contact with the clad material of the product strip). Further Considerations for Belt Configuration of Double-Clad Process deals with a modified equipment design which interposes two product support belts, one on each side of the product, between the clad strip and the rollers. In addition to the process description, this section presents the preliminary mechanical calculations for the endless metal belts and the work scope and results for the computer model revision and thermal analysis for the modified concept.

21578 (FEI–2372) **Nitrogen effect on crystal lattice dynamics in austenitic steel type Kh18AG19.** Danilkin, S.A.; Beskrovnyj, A.I. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1994. 21p. (In Russian). Order Number DE95633059. Source: OSTI; NTIS (US Sales Only); INIS.

The inelastic neutron scattering study of Fe-18Cr-19Mn alloy with nitrogen content between 1.5-3.7 at% is presented. The nitrogen content dependencies of lattice parameter and frequency spectrum are obtained. The metal atom spectrum depends only slightly on nitrogen content with mean parameters $<\epsilon>$ and $<\epsilon^2>$ unchanged. The effect of Me-Me interaction decrease caused by lattice dilation on $<\epsilon^2>$ is compensated by Me-N interaction. The nitrogen atoms frequencies are linear with lattice parameter for Fe-18Cr-19Mn and Fe-18Cr-10Mn-15Ni alloys. 13 refs.; 10 figs.; 3 tabs.

21579 (FEI–2413) **Study of oxygen influence on sodium surface tension.** Berenskij, L.L.; Ivanovskij, M.N.; Loginov, N.I.; Mikheev, A.S.; Morozov, V.A.; Shimkevich, A.L. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1994. 8p. (In Russian). Order Number DE95633088. Source: OSTI; NTIS (US Sales Only); INIS.

The results of experimental study of oxygen affect on the Kh18n10t steel wettability and sodium surface tension are presented. Oxygen dissolved in sodium in the concentration up to 30 ppm does not decrease capillary stress in a capillary-porous structure and accelerates its surface wettability. 10 refs.; 2 figs.; 2 tabs.

21580 (FEI–2415) **On the structure of molecular dynamic model of liquid potassium.** Kuzin, V.V.; Morozov, V.A.; Shimkevich, A.L.; Shimkevich, I.Yu. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1994. 18p. (In Russian). Order Number DE95633060. Source: OSTI; NTIS (US Sales Only); INIS.

Momentary and thermally relaxed structure of molecular dynamics model of liquid potassium has been examined within the framework of statistical geometry. It has been shown that dense part of liquid matrix is constructed with slightly distorted tetrahedral local atomic configurations. Such tetrahedra trend to aggregate sharing common faces. Scaling behaviour of clusters can be the evidence of their fractal-similar geometry. 15 refs.; 10 figs.

21581 (INIS-JP–028, pp. 112-114) **Relation between electrical resistivity and argon concentration of copper thin films prepared by ion-beam-assisted deposition.** Gotoh, Yasuhito (Kyoto Univ. (Japan). Dept. of Electronics); Yoshii, Hideki; Amioka, Takao; Kameyama, Koji; Tsuji, Hiroshi; Ishikawa, Junzo. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University.* Order Number DE95709897. Source: OSTI; NTIS; INIS.

Particle Induced X-ray Emission (PIXE) measurements were applied to the evaluation of the argon concentration in the copper thin films prepared by Ion-Beam-Assisted Deposition (IBAD) technique. The relation between electrical resistivity and argon concentration in the films were investigated. The crystallinity and the atomic density were also examined with x-ray diffraction and Rutherford Backscattering Spectrometry (RBS). The obtained results indicated that although the grain size of the films becomes larger with the ion irradiation, electrical resistivity increases with an increase in the ion quantity. (author).

21582 (IS-T–1714) **Optical anisotropy of (110) surfaces of Ag and Cu.** Chen, Zai. Ames Lab., IA (United States); Iowa State Univ. of Science and Technology, Ames, IA (United States). 20 Oct 1994. 106p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-82. Order Number DE95010130. Source: OSTI; NTIS; GPO Dep.

A reflectance-difference spectroscopy (RD) system was designed and built to study the anisotropic optical response of the (110) surfaces of silver and copper. Results of the RD spectra are described.

21583 (JFP–18) **Extrusion of I&E "O" size tubing to finalize the process. Experiment No. U-31.** Frazier, D.S.; Puterbaugh, J.F. Bridgeport Brass Co., Adrian, MI (United States). 3 Feb 1961. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. A.E.C. Contract Number AT-(30-1)-1405. Order Number DE95012632. Source: OSTI; NTIS; GPO Dep.

Work has been progressing on the development of an extrusion process for I&E tubing. The ultimate object of this development project is to compare the extrusion process from a cost standpoint with, the presently used rolling-drilling process. Various experiments have been performed to determine the optimum billet I.D., the proper follower block technique, the proper tooling parameters for the process, and the proper metallurgical structure of the material for optimum results. This extrusion combines many of the past results as a further determination and refinement of the extrusion process to be used in the final semi-production optimization extrusion. The object of this extrusion was to evaluate the resulted of previous extrusion experiments to determine final process conditions prior to an optimization extrusion.

21584 (LA-UR–95-739) **High strain rate deformation of Ti-48Al-2Cr-2Nb in the duplex morphology.** Maloy, S.A.; Gray, G.T. III. Los Alamos National Lab., NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950201–15: Annual meeting and exhibition of the Minerals, Metals and Materials Society (TMS), Las Vegas, NV (United States), 12-16 Feb 1995). Order Number DE95007852. Source: OSTI; NTIS; GPO Dep.

The compressive deformation behavior of Ti-48Al-2Nb-2Cr in the duplex microstructural morphology has been studied at strain rates of 0.001/s and 2000/s over the temperature range from -196 to 1100°C. The material was cast, homogenized, extruded and heat treated to obtain the duplex microstructure. The yield stress is strain rate sensitive at 25°C and increases with temperature at a strain rate of 2000/s from 500 to 1100°C. TEM investigations reveal that deformation occurs in γ-TiAl by means of [111]<112> twinning, 1/2<110> slip, and <101> superdislocations under all conditions depending on the orientation of the grain with respect to the deformation axis. Optical metallography reveals that twinning increases with increasing strain rate. TEM results revealing the dislocation substructure are used to explain the yield stress anomaly.

21585 (LA-UR–95-1319) **Development of local shear bands and orientation gradients in fcc polycrystals.** Beaudoin, A.J. Jr. (Reynolds Metals Co., Richmond, VA (United States)); Mecking, H.; Kocks, U.F. Los Alamos National Lab., NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. N00014-90-J-1810. (CONF-9506144–6: 5. international conference on numerical methods in industrial forming processes (NUMIFORM), Ithaca, NY (United

States), 18-21 Jun 1995). Order Number DE95012072. Source: OSTI; NTIS; INIS; GPO Dep.

A finite element formulation which derives constitutive response from crystal plasticity theory is used to examine localized deformation in fcc polycrystals. The polycrystals are simple, idealized arrangements of grains. Localized deformations within individual grains lead to the development of domains that are separated by boundaries of high misorientation. Shear banding is seen to occur on a microscopic scale of grain dimensions. The important consequences of these simulations are that the predicted local inhomogeneities are meeting various requirements which make them possible nucleation sites for recrystallization.

21586 (LA-UR–95-1320) **Magnetoresistance behavior of UNiGe.** Nakotte, H. (Los Alamos National Lab., NM (United States)); Lacerda, A.; Purwanto, A.; Havela, L.; Sechovsky, V.; Prokes, K.; Brueck, E.; Boer, F.R. de; Torikachvili, M.S. Los Alamos National Lab., NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States);U.S. Czechoslovak Science and Technology Joint Fund (United States). DOE Contract W-7405-ENG-36. (CONF-9505186–2: 2. physical phenomena at high magnetic fields conference, Tallahassee, FL (United States), 6-9 May 1995). Order Number DE95012071. Source: OSTI; NTIS; INIS; GPO Dep.

The authors have measured the temperature dependences of the magnetoresistance of single-crystalline UNiGe for both parallel (i/B//c-axis) and perpendicular configurations (i//a-axis, B//c-axis) in magnetic fields up to 18 T. Both configurations yield similar magnetoresistance behavior, which emphasizes the strong magnetic contribution to the resistivity in all directions. Crossing magnetic-phase boundaries causes anomalies in the magnetoresistance, which allowed a completion of the previously proposed magnetic phase diagram.

21587 (NUREG/CR–6275) **Mechanical properties of thermally aged cast stainless steels from Shippingport reactor components.** Chopra, O.K. (Argonne National Lab., IL (United States)); Shack, W.J. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering Technology; Argonne National Lab., IL (United States). Apr 1995. 155p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract W-31109-ENG-38. (ANL–94/37). Source: OSTI; NTIS; GPO; INIS.

Thermal embrittlement of static-cast CF-8 stainless steel components from the decommissioned Shippingport reactor has been characterized. Cast stainless steel materials were obtained from four cold-leg check valves, three hot-leg main shutoff valves, and two pump volutes. The actual time-at-temperature for the materials was ~13 y at ~281 C (538 F) for the hot-leg components and ~264 C (507 F) for the cold-leg components. Baseline mechanical properties for as-cast material were determined from tests on either recovery-annealed material, i.e., annealed for 1 h at 550 C and then water quenched, or material from the cooler region of the component. The Shippingport materials show modest decreases in fracture toughness and Charpy-impact properties and a small increase in tensile strength because of relatively low service temperatures and ferrite content of the steel. The procedure and correlations developed at Argonne National Laboratory for estimating mechanical properties of cast stainless steels predict accurate or slightly lower values for Charpy-impact energy, tensile flow stress, fracture toughness J-R curve, and J_{IC} of the materials. The kinetics of thermal embrittlement and degree of embrittlement at saturation, i.e., the minimum impact energy achieved after long-term aging, were established from materials that were aged further in the laboratory. The results were consistent with the estimates. The correlations successfully predicted the mechanical properties of the Ringhals 2 reactor hot and crossover-leg elbows (CF-8M steel) after service of ~ 15 y and the KRB reactor pump cover plate (CF-8) after ~ 8 y of service.

21588 (PNL-SA–26120) **Implications of early stages in the growth of stress corrosion cracking on component reliability.** Jones, R.H.; Simonen, E.P. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9504156–1: Research Assistant Task Force conference, Charlotte, NC (United States), 11-13 Apr 1995). Order Number DE95011498. Source: OSTI; NTIS; GPO Dep.

Environment-induced crack growth generally progresses through several stages prior to component failure. Crack initiation, short crack growth, and stage 1 growth are early stages in crack development that are summarized in this paper. The implications of these stages on component reliability, derive from the extended time that the crack exists in the early stages because crack velocity is slow. The duration of the early stages provides a greater opportunity for corrective action if cracks can be detected. Several important factors about the value of understanding short crack behavior include: (1) life prediction requires a knowledge of the total life cycle of the crack including the early stages, (2) greater reliability is possible if the transition between short and long crack behavior is known component life after this transition is short and (3) remedial actions are more effective for short than long cracks.

21589 (SAND–95-0855C) **Qualification of environmentally friendly cleaners.** De Marquis, G.; Lopez, E.P. Sandia National Labs., Albuquerque, NM (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9503119–4: ECM '95 conference, Las Cruces, NM (United States), 12-15 Mar 1995). Order Number DE95011873. Source: OSTI; NTIS; GPO Dep.

Sandia National Laboratories (SNL) has traditionally used chlorinated and fluorinated organic solvents for general degreasing applications. Many of these solvents have been labeled by the Federal Government as ozone depleting chemicals and as toxic and/or suspected carcinogens. As a result, these solvents will no longer be recommended for use within the DOE weapons complex. There are three major classes of materials that are of concern for cleaning: organics, metals and ceramics. Each of these materials has its own special cleaning problems. Solvents that were used in the past, such as 1,1,1-trichloroethane (TCA) and trichloroethylene (TCE), were extremely efficient at removing everything from oils and greases to salts without leaving corrosive residues or permanently absorbing into the materials. These traditional degreasing solvents were essentially "all-inone" cleaners: quick, reliable, and easy to use. Unfortunately, a "drop-in" cleaner for such a wide variety of materials and contaminants will probably never be identified. So far, it has been difficult to identify environmentally conscious cleaners that clean as well as TCE and TCA. Most alternative cleaners require more volume to do the job, and also require longer exposure to get the job done. With these things in mind, we are hoping to identify and qualify new cleaners that will take care of general classes of materials.

21590 (SAND–95-0885) **Capacitive sensor for high resolution weld seam tracking.** Schmitt, D.J.; Novak, J.L.; Akins, J.L. Sandia National Labs., Albuquerque, NM (United States). May 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95011833. Source: OSTI; NTIS; GPO Dep.

A non-contact capacitive sensing system has been developed for guiding automated welding equipment along typical v-groove geometries. The Multi-Axis Seam Tracking (MAST) sensor has been designed to produce four electric fields for locating and measuring the v-groove geometry. In this system, the MAST sensor is coupled with a set of signal conditioning electronics making it possible to output four varying voltages proportional to the electric field perturbations. This output is used for motion control purposes by the automated welding platform to guide the weld torch directly over the center of the v-groove. This report discusses the development of this capacitive sensing system. A functional description of the system and MAST sensor response characteristics for typical weld v-groove geometries are provided. The effects of the harsh thermal and electrical noise environments of plasma arc welding on sensor performance are discussed. A comparison of MAST sensor fabrication from glass-epoxy and thick-film ceramic substrates is provided. Finally, results of v-groove tracking experiments on a robotic welding platform are described.

21591 (SAND–95-8507C) **Numerical simulation and experimental observations of initial friction transients.** Hughes, D.A.; Weingarten, L.I.; Dawson, D.B. Sandia National Labs., Albuquerque, NM (United States). [1995]. 7p. Sponsored by USDOE,

Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9506144–8: 5. international conference on numerical methods in industrial forming processes (NUMIFORM), Ithaca, NY (United States), 18-21 Jun 1995). Order Number DE95014250. Source: OSTI; NTIS; GPO Dep.

Experiments were performed to better understand the sliding frictional behavior between metals under relatively high shear and normal forces. Microstructural analyses were done to estimate local near-surface stress and strain gradients. The numerical simulation of the observed frictional behavior was based on a constitutive model that uses a state variable approach.

21592 (SAND–95-8551C) **Super-leidenfrost spray cooling: A solution to the problem of controlled high-temperature, high-flux heat extraction.** Edwards, C.F.; Hahn, D.W. Sandia National Labs., Livermore, CA (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9505212–1: ILASS Americas '95: 8. annual conference on liquid atomization and spray system, Troy, MI (United States), 21-24 May 1995). Order Number DE95010758. Source: OSTI; NTIS; GPO Dep.

Our interest in spray cooling stems from a problem in high-temperature materials synthesis. Specifically, it is the growth of diamond films by flame chemical vapor deposition (CVD). A high velocity jet of premixed $C_2H_2/O_2/H_2$ is formed into a stagnation point flow over the surface of a molybdenum mandrel causing the formation of a highly strained flame immediately adjacent to the surface. The difficulty that arises is that concomitant with the flux of energetic species to the surface is a large flux of heat which must be removed from the mandrel if control of the growth process is to be maintained. The situation is further complicated by the fact that the deposition surface temperature must be held to a tight tolerance somewhere within the optimal diamond growth range (~1200 K) and the heat extraction must be made in a one-dimensional fashion to preserve the uniform boundary condition on the flame. Since the cooling surface temperature is fixed near the saturation condition by the phase change of the droplets, and the heat flux into the mandrel is imposed by the flame, the only way to achieve a desired deposition surface temperature is to vary the thermal resistance of the mandrel itself. Since the cooling surface is isothermal, uniform temperature at the deposition surface will only result if the heat flux through the mandrel is uniform, that is, if the sides of the mandrel are effectively adiabatic and the flame is uniform over the mandrel surface. If either of these conditions is not met, the deposition surface temperature cannot be made uniform using this method. These limitations could be overcome if it were possible to carry out the spray cooling process without being tied to the isothermal boundary condition inherent in phase-cooling. Such a solution exists for spray cooling above the Leidenfrost temperature; that is the subject of this paper – super-Leidenfrost spray cooling.

21593 (SAND–95-8554C) **Printability of substrate and absorber defects on extreme ultraviolet lithographic masks.** Nguyen, K.B. (Sandia National Labs., Livermore, CA (United States)); Ray-Chaudhuri, A.K.; Tichenor, D.A.; Stulen, R.H.; Nissen, R.P.; Berger, K.W.; Paul, P.H.; Tennant, D.M.; Fetter, L.A.; Windt, D.L. Sandia National Labs., Albuquerque, NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950226–47: SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine, San Jose, CA (United States), 5-14 Feb 1995). Order Number DE95010916. Source: OSTI; NTIS; GPO Dep.

This paper reports results from a study of defect printability for extreme ultraviolet lithographic masks (EUVL). Imaging experiments were performed with an EUVL mask containing programmed defects. The mask contained defects of different sizes and locations with respect to the absorber patterns. Since an EUVL mask consists of absorber layer patterned above a multilayer-coated substrate, both substrate defects, located below the reflective coating, and absorber defects, located above the reflective coating, were included on the programmed defect mask. The absorber layer was patterned using a process previously described by Tennant et al. Imaging was performed using a 10X Schwarzschild camera operating at 13.4 nm with a numerical aperture of 0.08, corresponding to a Rayleigh resolution of 0.1 gm. This system has an effective exposure field of 0.4 mm diameter. Both positive-tone and negative-tone resists were used. Measurements of the defect-induced linewidth variations on the printed resist lines were performed with scanning electron microscopy (SEM) and atomic force microscopy (AFM). Results show that substrate defects are more printable compared to defects of the same sizes located above the reflective coating. In addition, defects located in the center of a clear region in lines-and-space pattern are more printable compared to those located nearer to the absorber lines.

21594 (TKK-V–B82) **Computer simulation of gas flow in the flash smelting furnace.** Jokilaakso, A.; Yang, Yongxiang; Teppo, O.; Ahokainen, T.; Haenninen, A. Helsinki Univ. of Technology, Otaniemi (Finland). Lab. of Materials Processing and Powder Metallurgy. 1993. 56p. Project KTM-SULA 10. Order Number DE95779270. Source: OSTI; NTIS.

SULA2 Research Programme.

This report presents the detailed results of computer simulation of flow in the Outokumpu flash smelting furnace. The work belongs to the project SULA-10: 'Reaction and flow dynamic modelling of suspension smelting technology', and was carried out in Laboratory of Materials Processing and Powder Metallurgy at Helsinki University of Technology. The geometry of the flash smelting furnace was simulated with a laboratory scale water and gas models. The same geometry was created as computational grids, in which the flow situation was analysed. The results from the laboratory models and computational grids were found to be in good agreement. The computer simulation was then extended to an industrial-scale flash smelting furnace. Cold gas flow was analysed in order to obtain a general flow pattern and working computational grid for future work with heat transfer, two-phase flow and chemical reactions. The computation was carried out with PHOENICS-based software EasyFlow and CFD2000. (orig.)

21595 (TKK-V–B94) **Flow and heat transfer simulation in a flash smelting furnace.** Ahokainen, T.; Jokilaakso, A.; Teppo, O.; Yang, Yongxiang. Helsinki Univ. of Technology, Otaniemi (Finland). Lab. of Materials Processing and Powder Metallurgy. 1994. 36p. Order Number DE95779247. Source: OSTI; NTIS.

Fluid flow and heat transfer phenomena taking place in an industrial Outokumpu type flash smelting furnace were simulated with CFD software CFD2000 1.0 and PHOENICS 1.6.6. The computational domains and grids are basically the same as described in earlier reports. However, some changes and simplifications are made to the grids,especially in the reaction shaft model. The standard k-ϵ turbulence model and the six-flux radiation model were applied to the relevant flow and heat transfer computations. Both the Lagrangian and Eulerian treatment were used in two-phase flow calculations to describe the particle phase. All the two-phase simulations presented in this report are cold and isothermal, where the particles exchange only momentum with the gas phase. As a first attempt, combustion of gaseous sulphur with oxygen was used to represent the heat release from the copper concentrate oxidation reactions. The results presented in this report are preliminary reflecting the different stages of the model development. (orig.)

21596 (UCRL-ID–116849) **A solidification constitutive model for NIKE2D and NIKE3D.** Raboin, P.J. Lawrence Livermore National Lab., CA (United States). 17 Mar 1994. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95012103. Source: OSTI; NTIS; GPO Dep.

This memo updates the current status of a solidification material model development which has been underway for more than a year. Significant modeling goals such as predicting cut-off stresses, thermo-elasto-plasticity, strain rate dependent plasticity and dynamic recovery have been completed. The model is called SOLMAT for solidification material model, and while developed for NIKE2D, it has already been implemented in NIKE3D and NIT03D by B. Maker. This memo details the future development strategy of SOLMAT including liquid and solid constitutive improvements, coupling of deviatoric and dilatational deformation and a plan to switch between constitutive theories. It explains some of the difficulties associated solidification modeling and proposes two experiments to measure properties for using SOLMAT. Due to the sensitive nature

of these plans in relation to programmatic and CRADA concerns, this memo should be treated as confidential document.

21597 (UCRL-ID–119335) **Concurrent solid state diffusion bonding and superplastic forming of aluminum alloy 7475.** Sunwoo, A.; Lum, R.; Vandervoort, R. Lawrence Livermore National Lab., CA (United States). Jan 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95013290. Source: OSTI; NTIS; GPO Dep.

Earlier studies on diffusion bonding (DB) of Al alloys have focused mostly in extrinsically changing the bonding conditions through the use of interlayers, surface etching, or environment. The problem with focusing on the extrinsic conditions only is that the benefits of the DB process are not fully utilized and instead, it can create problems for the base alloy. The approach we have taken to study solid state diffusion bondability of Al alloy is to utilize the intrinsic behavior of superplastic material. Beginning with this preprocessed material, we used a unique method, to obtain diffusion bonding concurrently with superplastic forming to achieve ductile, oxide-free bonds at significantly lower pressures and temperature in an argon atmosphere.

21598 (UCRL-ID–119964) **Machinability study of Aermet 100.** Squire, D.V.; Syn, C.K.; Fix, B.L. Lawrence Livermore National Lab., CA (United States). 8 Feb 1995. 14p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. MIPR No. N62269/94/MR/00307. Order Number DE95011532. Source: OSTI; NTIS; GPO Dep.

Machinability of Aermet 100, an ultrahigh strength alloy developed for Navy by Carpenter Technology as a candidate material for aircraft landing gear application, was studied by performing single-point turning tests. Coated and uncoated carbides, ceramic, and cermet cutting tool inserts of a square geometry (SNG 432 type) were used. Round stock workpieces were tested in the as - received, unaged condition and without using any cutting fluid. The turning tests for each tool material were conducted by (i) first establishing the cutting conditions that would allow the continued generation of broken chips during a given cutting test, (ii) measuring intermittently the flank wear as a function of cutting time under such established cutting conditions for discontinuous broken chips, and (iii) determining the tool life using the criteria specified in the ISO Standard 3685: 1993(E). Cutting tools except some uncoated carbide and ceramic were used with a mechanical chip breaker to induce chip breakage and avoid the generation of long continuous chips. The results obtained include the optimal cutting conditions for discontinuous chips, tool wear - cutting time curves, and records of tool life and tool failure mode for each tool material. From the measured tool life and cutting conditions, the amount of material removed by each cutting material was calculated. Coated carbide with CVD tri-phase coating showed the longest tool life that exceeded the twelve minute criterion and removed the highest amount of material per tool. Other tools failed by cutting edge chipping and their lives were shorter.

21599 (UCRL-ID–120611) **Electrodeposited tungsten-nickel-boron: A replacement for hexavalent chromium.** Steffani, C.; Meltzer, M. Lawrence Livermore National Lab., CA (United States). Apr 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95011809. Source: OSTI; NTIS; INIS; GPO Dep.

Chromium, deposited from acidic solutions of its hexavalent ion, has been the rule for wear resistant, corrosion resistant coatings for many years. Although chromium coatings are durable, the plating process generates air emissions, effluent rinse waters, and process solutions that are toxic, suspected carcinogens, and a risk to human health and the environment. Tungsten-nickel-boron (W-Ni-B) alloy deposition is a potential substitute for hexavalent chrome. It has excellent wear, corrosion, and mechanical properties and also may be less of an environmental risk. This study examines the electroplating process and deposit properties of W-Ni-B and compares them with those of hexavalent chrome.

21600 (UCRL-JC–117773) **3D metal forming applications of ALE techniques.** Couch, R.; McCallen, R.; Otero, I.; Sharp, R. Lawrence Livermore National Lab., CA (United States). 27 Jan 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9506144–3: 5. international conference on numerical methods in industrial forming processes (NUMIFORM), Ithaca, NY (United States), 18-21 Jun 1995). Order Number DE95011745. Source: OSTI; NTIS; GPO Dep.

A three-dimensional arbitrary Lagrange-Eulerian (ALE) code is being developed for use as a general purpose tool for metal forming analyses. The focus of the effort is on the processes of forging, extrusion, casting and rolling. The ALE approach was chosen as an efficient way to deal with the large deformations and complicated flows associated with these processes. A prototype version of the software package, ALE3D, exists and is being applied to the enumerated processes. It is a finite element code which treats fluid and elastic-plastic response on an unstructured mesh. The prototype version includes heat transfer and the option of either implicit or explicit time integration of the dynamic equations. The status of the code is described. Several examples of application of the code to typical forming simulations are presented with discussions of the advantages and disadvantages of the ALE approach.

21601 (UCRL-JC–117980) **Analysis of interaction phenomena between liquid jets and materials.** Kang, Sang-Wook; Reitter, T.; Carlson, G. Lawrence Livermore National Lab., CA (United States). Feb 1995. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950853–1: ASME/JSME annual summer meeting of the Fluids Engineering conference, Hilton Head, SC (United States), 13-17 Aug 1995). Order Number DE95010747. Source: OSTI; NTIS; GPO Dep.

The interaction phenomena of high-velocity liquid jets impinging on a material surface have been investigated theoretically and experimentally to gain an understanding of the physical mechanisms involved in material removal by fluidjet machining processes. Experiments were performed to determine conditions under which the liquid jet impacting a solid material will cause material removal and also to delineate possible physical mechanisms of mass removal at optimum jet-cutting conditions. We have also carried out numerical simulations of jet-induced surface pressure rises and of the material deformation and spallation behavior due to multiple droplet impacts. Results obtained from the experiments and theoretical calculations and their physical implications are also discussed.

21602 (UCRL-JC–119951) **Finite-element analysis of earing using non-quadratic yield surfaces.** Logan, R.W. Lawrence Livermore National Lab., CA (United States). 18 Jun 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9506144–2: 5. international conference on numerical methods in industrial forming processes (NUMIFORM), Ithaca, NY (United States), 18-21 Jun 1995). Order Number DE95011429. Source: OSTI; NTIS; GPO Dep.

During deep draw cupping, the phenomenon known as earing may occur as the cup wall is formed, resulting in a periodic variation of cup wall height around the perimeter of the finished cup. This is generally due to planar anisotropy of flow in rolled sheet product. It is generally observed that the anisotropy parameter R will vary in the plane of the sheet when ears are observed in cupping, with a parameter ΔR describing the variation of R in the plane of the sheet. For many common textures in face-centered and body-centered materials, the ears form relative to the sheet rolling direction at 0° and 90° around the perimeter if $\Delta R>0$, and at -45° and +45° if $\Delta R<0$. There is extensive experimental evidence that ear height shows a linear correlation with $\Delta R/R$, but attempts to duplicate this using the finite-element method are highly dependent on both the methodology and yield surface used. It was shown previously that using a coarse mesh and the quadratic Hill yield surface tends to greatly under predict earing. In this study, we have used two different finite-element codes developed at LLNL to examine the predicted earing using both quadratic Hill and alternative non-quadratic yield surfaces. These results are compared to experimental data and conclusions drawn about the most desirable closed-form yield surfaces to duplicate the observed earing phenomena.

21603 (UCRL-JC–120255) **Multilayer thermoelectric films: A strategy for the enhancement of ZT.** Wadgner, A.V.; Foreman,

R.J.; Summers, L.J.; Barbee, T.W. Jr.; Farmer, J.C. Lawrence Livermore National Lab., CA (United States). Mar 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950729–3: 30. Intersociety energy conversion conference, Orlando, FL (United States), 30 Jul - 5 aug 1995). Order Number DE95011535. Source: OSTI; NTIS; GPO Dep.

The relative efficiency of a thermoelectric material is measured in terms of a dimensionless figure of merit, ZT. Although all known thermoelectric materials are believed to have $ZT \leq 1$, recent theoretical results predict that thermoelectric (devices fabricated as two-dimensional quantum wells (2D QWs) could have $ZT \geq 3$. Multilayers with the dimensions of 2D QWs have been synthesized by alternately sputtering $Bi_{0.9}Sb_{0.1}$ and $PbTe_{0.8}Se_{0.2}$ onto a moving substrate from a pair of magnetron sources. These materials have been synthesized to test the thermoelectric quantum-well concept and gain insight into relevant transport mechanisms. This work focuses primarily on the scientific issues involved in producing the materials necessary to examine the possibility of enhancing ZT using quantum confinement. The techniques needed to measure the relevant electrical parameters of thermoelectric thin films are developed in this paper. Ultimately, if a quantum well enhancement of thermoelectrics is experimentally observed, devices based on this technology could be used to greatly expand the role of thermoelectrics in power generation and refrigeration.

21604 (WSRC-MS–94-0416) **Assessment of remaining service life of 1Cr-0.5Mo steam piping.** Daugherty, W.L.; Vormelker, P.R. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950288–1: Microstructure and mechanical properties of aging materials, Las Vegas, NV (United States), 12-16 Feb 1995). Order Number DE95010972. Source: OSTI; NTIS; GPO Dep.

A Savannah River Site power plant has been in operation for 40 years, producing electricity and process steam for the site. This coal-fired plant employs ICr-0.5Mo steam piping which is exposed to temperatures up to about 500°C in service. With applied loads on the order of 69 MPa (10 ksi), this pipe is at the lower bound of conditions that might lead to service-induced creep damage. Efforts to characterize the creep damage to date and predict the remaining service life are two-fold, employing microstructural characterization (through the use of in-situ metallography) and analytic predictions based on constitutive equations and creep data available in the literature. This effort is part of an overall program to evaluate life extension of this power plant versus new construction. The literature contains many examples of efforts to correlate microstructural changes to the extent of creep damage and remaining service life. A brief review identified examples as far back as the 1950s. The concepts and techniques involved have matured to the point where this means of life prediction can be considered a standard tool in the engineer's arsenal. In this regard, a comparison is made between this approach to life extension and an analytical approach based on basic creep data and constitutive equations. Possible pitfalls of each method are discussed. It is concluded that both approaches can offer valuable insights depending on the circumstances of the situation at hand.

21605 (WSRC-MS–95-0033) **Calibration of a Modified Californium Shuffler.** Sadowski, E.T. (Westinghouse Savannah River Company, AIKEN, SC (United States)); Armstrong, F.; Oldham, R.; Ceo, R.; Williams, N. Westinghouse Savannah River Co., Aiken, SC (United States). 1 Jun 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950787–2: 36. annual meeting of the Institute for Nuclear Materials Management, Palm Desert, CA (United States), 9-12 Jul 1995). Order Number DE95060152. Source: OSTI; NTIS; INIS; GPO Dep.

A californium shuffler originally designed to assay hollow cylindrical pieces of UA1 has been modified to assay solid cylinders. Calibration standards were characterized via chemical analysis of the molten UA1 taken during casting of the standards. The melt samples yielded much more reliable characterization data than drill samples taken from standards after the standards had solidified. By normalizing one well-characterized calibration curve to several standards at different enrichments, a relatively small number of standards was required to develop an enrichment-dependent calibration. The precision of this shuffler is 0.65%, and the typical random and systematic uncertainties are 0.53% and 0.73%, respectively, for a six minute assay of an ingot containing approximately 700 grams of ^{235}U. This paper will discuss (1) the discrepancies encountered when UA1 standards were characterized via melt samples versus drill samples, (2) a calibration methodology employing a small number of standards, and (3) a comparison of results from a previously unused shuffler with an existing shuffler. A small number of UA1 standards have been characterized using samples from the homogeneous molten state and have yielded enrichment-dependent and enrichment-independent calibration curves on two different shufflers.

(CONF-950201–14: Annual meeting and exhibition of the Minerals, Metals and Materials Society (TMS), Las Vegas, NV (United States), 12-16 Feb 1995). Order Number DE95009889. Source: OSTI; NTIS; GPO Dep.

Decreasing the total lead content from $Pb_{0.4}$ to $Pb_{0.3}$ significantly stunts Bi-2223 phase development and greatly reduces the critical current density (J_c) of powder-in-tube tapes made by a two-powder process. This effect can be explained on the basis of the solubility limit for lead in 2212. $Pb_{0.4}$ samples exceed the solubility limit for lead in 2212, so lead is rejected to create a lead-rich liquid that enhances the kinetics of 2223 formation during heat treatment. By contrast, a liquid does not form in the $Pb_{0.3}$ sample because its lead content is below the solubility limit. As a result, 2223 formation is much slower and J_c is much lower in the $Pb_{0.3}$ sample.

21607 (ANL/ET/CP–84391) **Transient and steady-state erosion of in-situ reinforced silicon nitride.** Karasek, K.R. (Allied Signal Research and Technology, Des Plaines, IL (United States)); Whalen, P.J.; Rateick, R.G. Jr.; Hamilton, A.C.; Routbort, J.L. Argonne National Lab., IL (United States). Oct 1994. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950584–1: Annual meeting of the Society of Tribologists and Lubrication Engineers, Chicago, IL (United States), 14-18 May 1995). Order Number DE95013436. Source: OSTI; NTIS; GPO Dep.

Relative to most other materials silicon nitride is very erosion resistant. However, the resulting surface flaws degrade strength - a serious concern for component designers. AlliedSignal Ceramic Components GS-44 in-situ reinforced silicon nitride was eroded in a slinger apparatus. Both transient (extremely low level) and steady-state erosion regimes were investigated. Alumina particles with effective average diameters of 140 Jim and 63 μm were used at velocities of 50 m/s, 100 m/s, and 138 m/s. Biaxial tensile strength was measured. Strength decreased by about 15% after a very small erodent dosage and then remained virtually constant with further erosion. In-situ reinforcement produces R-curve behavior in which the fracture toughness increases with crack size. The effect of this is quite dramatic with strength loss being significantly less than expected for a normal silicon nitride with constant fracture toughness.

21608 (ANL/ET/CP–84592) **Electronic/Ionic conductivity and oxygen diffusion coefficient of Sr-Fe-Co-O system.** Ma, B. (Argonne National Lab., IL (United States)); Park, J.H.; Balachandran, U.; Segre, C.U. Argonne National Lab., IL (United States). Mar 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950412–17: Spring meeting of the Materials Research Society (MRS), San

Francisco, CA (United States), 17-21 Apr 1995). Order Number DE95012928. Source: OSTI; NTIS; GPO Dep.

Oxides in the system Sr-Fe-Co-O exhibit both electronic and ionic conductivities. Recently, Sr-Fe-Co-O system attracted great attention because of the potential to be used for oxygen permeable membranes that can operate without the electrodes or external electrical circuitry. Electronic and ionic conductivities at various temperatures have been measured on two compositions in Sr-Fe-Co-O system named SFC-1 and SFC-2. The electronic transference number is much greater than the ionic transference number in SFC-1 sample, while the electronic and ionic transference numbers are very close in SFC-2 sample. At 800°C, the electronic conductivity and ionic conductivity are ≈76 S-cm-1 and =4 S-cm-1, respectively, for SFC-1. While, for SFC-2, the electronic and ionic conductivities are =10 S-cm-1 and ≈7 S-cm-1, respectively. By a local fitting to $\sigma \cdot T = A \exp(-E_a/\kappa T)$, we found that the oxide ion activation energies are 0.92 eV and 0.37 eV respectively for SFC-1 and SFC-2 samples. Oxygen diffusion coefficient of SFC-2 is $\approx \times 10^{-7}$ cm²/sec at 900C.

21609 (ANL/MSD/CP–84416) **Structure and properties of heteroepitaxial $Pb(Zr_{0.35}Ti_{0.65})O_3/SrRuO_3$ multilayer thin films on $SrTiO_3$(100) prepared by MOCVD and RF sputtering.** Foster, C.M. (Argonne National Lab., IL (United States)); Csencsits, R.; Bai, G.R.; Li, Z.; Wills, L.A.; Hiskes, R.; Al-Shareef, H.N.; Dimos, D. Argonne National Lab., IL (United States); Sandia National Labs., Albuquerque, NM (United States). Apr 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38 ; AC04-94AL85000. (CONF-9503144–1: 7. international symposium on integrated ferroelectrics, Colorado Springs, CO (United States), 20-22 Mar 1995). Order Number DE95011420. Source: OSTI; NTIS; GPO Dep.

Epitaxial $SrRuO_3$ thin films were deposited on $SrTiO_3$(100) substrates by RF sputtering for use as bottom electrodes and epitaxial buffer layers. On these conductive substrates, epitaxial $Pb(Zr_{0.35}Ti_{0.65})O_3$ (PZT) thin films were deposited by metalorganic chemical vapor deposition (MOCVD). X-ray diffraction (XRD), transmission electron microscopy (TEM) and optical waveguiding were used to characterize the phase, refractive index, and film thickness of the deposited films. The epitaxial PZT films were c-axis oriented and contained ~19.7% volume fraction of 90° domains. Ferroelectric hysteresis and dielectric measurements of epitaxial PZT ferroelectric capacitor structures formed using sputtered ITO top electrodes showed: a remanent polarization of 51.8μC/cm², a coercive field of 54.9 kV/cm, a dielectric constant of 410, a bipolar resistivity of ~$5.8 \times 10^9 \Omega$-cm at a field of 275 kV/cm, and a breakdown strength of >400 kV/cm. The cyclic fatigue behavior of the films showed a strong dependence on the choice of electrode materials and the fatiguing wave form. These data support the model that the fatigue mechanism in these films arises from the trapping of injected charge carriers and is predominately an electronic phenomenon.

21610 (ANL/MSD/PP–75789) **Comparison of short and longer term loading on the creep behaviour of alumina-silicon carbide whisker composites.** Swan, H. (Chalmers Univ. of Technology, Goteborg (Sweden). Dept. of Physics); Arellano-Lopez, A.R. de; Dominguez-Rodriguez, A.; Routbort, J.L.; Swain, M.V. Argonne National Lab., IL (United States). Nov 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95012219. Source: OSTI; NTIS; GPO Dep.

The incorporation of SiC whiskers into alumina ceramics has resulted in several improved room temperature properties of the composite such as fracture toughness, strength, erosion resistance and fatigue. The creep resistance has also been generally observed to increase with the addition of whiskers. However, significant scatter in measured secondary creep rates still exist, depending on the material and the test conditions that were utilized. The objective of this investigation was to compare two separate creep tests performed in compression using a SiC_w/Al_2O_3 material obtained from the same process batch. The differences in creep behavior between the tests could thus be ascribed to the difference in creep conditions solely. In one case the creep behavior was studied under short term loading (<3 h) conditions in air, while longer term loading (<100 h) conditions in argon were applied in the other case. The creep results and the microstructure of the samples were compared and related to each other, and to previous results in the literature.

21611 (ANL/MSD/PP–82476) **Origin of 1/f noise peaks of $YBa_2Cu_3O_x$ films in a magnetic field.** Kang, W.N. (Korea Institute of Science and Technology, Seoul (Korea, Democratic People's Republic of). Applied Physics Group); Kim, D.H.; Park, J.H. Argonne National Lab., IL (United States). Feb 1994. 18p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States);Korean Ministry of Science and Technology (Korea, Republic of). DOE Contract W-31109-ENG-38. Contract No. DMR 91-20000. Order Number DE95013495. Source: OSTI; NTIS; GPO Dep.

The temperature and magnetic field dependence of 1/f noise has been measured in epitaxial $YBa_2Cu_3O_x$ films. In a magnetic field, two noise peaks were observed as temperature decreases; one at higher temperature was found to match the thermal fluctuation of the sample resistance and the other near the foot of the transition was found to be magnetic-field dependent. The location of the latter was shifted toward low temperature and the peak height was decreased as a magnetic field increased. In a zero field only one peak from the resistance fluctuation was observed. We show that the field-dependent noises are due to flux motion interacting with the pinning potential. A classical model is used to explain the field-induced noise peaks. We interpret that the temperature dependences of the flux bundle size and the sample resistance are the reasons for the noise peaks, and a rough estimation of the temperature and field dependence of the flux bundle size is presented. Any possible relationship between the noise peaks and the flux-line-lattice phase transition is also discussed.

21612 (ANL/MSD/PP–84782) **In situ x-ray diffraction study of $CoSi_2$ formation during annealing of a Co/Ti bilayer on Si*(100).** Selinder, T.I. (Argonne National Lab., IL (United States)); Roberts, T.A.; Miller, D.J.; Beno, M.A.; Knapp, G.S.; Gray, K.E.; Ogawa, S.; Fair, J.A.; Fraser, D.B. Argonne National Lab., IL (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract W-31109-ENG-38. Grant DMR 91-20000. Order Number DE95012213. Source: OSTI; NTIS; GPO Dep.

X-ray diffraction (XRD) was performed in situ during annealing of a Co/Ti/Si(001) multilayer, which produced an epitaxial $CoSi_2$ layer. The results indicate that the Ti layer did. not stay intact during the reaction, and thus could not act like a membrane, moderating Co/Si interdiffusion. A strongly textured metastable phase (M) formed prior to $CoSi_2$ nucleation. This intermediary reaction product was unobservable upon completion of the anneal. We report that nucleation and growth of $CoSi_2$ on Si(100) took place in the presence of M, a new Co-Ti-Si-(O) phase, located at the metal/Si interface. M might play an important role in the perfection of the silicide. Ti and Co metals intermix already below 300°C, and there was evidence that metallic Ti precipitated at the surface, commencing at 550°C.

21613 (CEA-CONF–11769) **Nanometric onion-like hollow spheres in laser synthesized boron nitride ultrafine powder.** Boulanger, L. (CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Direction des Technologies Avancees); Willaime, F.; Cauchetier, M. CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Direction des Technologies Avancees. 1994. 2p. (CONF-940766–: 13. international congress on electron microscopy, Paris (France), 17-22 Jul 1994). Order Number DE95630982. Source: OSTI; NTIS (US Sales Only); INIS.

TEM observations of ultra-fine B Cl_3-N H_3 powders elaborated by an innovative method, laser pyrolysis, are presented. The resulting microstructures in the as received state and after thermal treatments show small nanometric scale configurations close to the ones met with carbon, such as an hollowed configuration of onions but at a much smaller scale than with carbon. 3 figs., 3 refs.

21614 (CONF-950129–7) **Optimization of the gelcasting of a silicon nitride formulation.** Omatete, O.O. (Oak Ridge National Lab., TN (United States)); Pollinger, J.P.; O'Young, K. Oak Ridge

National Lab., TN (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States);National Inst. of Standards and Technology, Gaithersburg, MD (United States). DOE Contract AC05-84OR21400. From 19. annual conference on advanced ceramics, materials and structures; Cocoa Beach, FL (United States); 9-12 Jan 1995. Order Number DE95012898. Source: OSTI; NTIS; GPO Dep.

An optimum gelcasting condition for a silicon nitride formulation was determined using the Taguchi statistical method. An $L_8(4^1 \times 2^4)$ design, in which the effects of one factor at four levels and four factors at two levels were evaluated in only eight experiments, was used. The factors at two levels were: the total monomer concentration, the monomer/crosslinker ratio, the initiator concentration, and the initiator/catalyst ratio; the factor at four levels was the initiator concentration per mass of the slip. The primary criterion used to determine optimum design was the green strength of the dried part, although three other parameters were measured: initial slip viscosity, time for the slip viscosity to reach 300 mPa.s. at 25 C, and time for the slip to gel at 50 C. The optimum gelcasting conditions from the designed experiments predicted 80% increase in green strength (4.3 MPa versus 2.4 MPa, the initial value). The confirmation runs showed only a 60% increase (3.8 MPa).

21615 (CONF-950129–8) **Gas pressure sintering of silicon nitride to optimize fracture toughness.** Tiegs, T.N.; Nunn, S.D.; Beavers, T.M.; Menchhofer, P.A.; Barker, D.L.; Coffey, D.W. Oak Ridge National Lab., TN (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 19. annual conference on advanced ceramics, materials and structures; Cocoa Beach, FL (United States); 9-12 Jan 1995. Order Number DE95012899. Source: OSTI; NTIS; GPO Dep.

Gas-pressure sintering (GPS) can be used to densify silicon nitride containing a wide variety of sintering additives. Parameters affecting the sintering behavior include densification temperature, densification time, grain growth temperature, grain growth time and heating rates. The Si_3N_4-6% Y_2O_3-2% $A1_2O_3$ samples sintered to high densities at all conditions used in the present study, whereas the Si_3N_4-$Sr_2La_4Yb_4(SiO_4)_6O_2$ samples required the highest temperatures and longest times to achieve densities $\geq$98 % T. D. The main effect on the fracture toughness for Si_3N_4-6% Y_2O_3-2% $A1_2O_3$ samples was the use of a lower densification temperature, which was 1900C in the present study. For the Si_3N_4-$Sr_2La_4Yb_4SiO4_4)_6O_2$ composition, fracture toughness was sensitive to and improved by a slower heating rate (10c/min), a lower densification temperature (1900'), a higher grain growth temperature (2000C), and a longer grain growth time (2 h).

21616 (CONF-950637–1) **Defect formation and carrier doping in epitaxial films of the "parent" compound $SrCuO_2$: Synthesis of two superconductors descendants.** Feenstra, R. (Oak Ridge National Lab., TN (United States)); Norton, D.P.; Budai, J.D.; Jones, E.C.; Christen, D.K.; Kawai, T. Oak Ridge National Lab., TN (United States). Apr 1995. 3p. Sponsored by USDOE, Washington, DC (United States);Japan Society for the Promotion of Science, Tokyo (Japan). DOE Contract AC05-84OR21400. From International workshop on superconductivity: controlled processing of high temperature superconductors - fundamentals and applications; Maui, HI (United States); 18-21 Jun 1995. Order Number DE95012871. Source: OSTI; NTIS; INIS; GPO Dep.

The infinite layer or parent compounds $ACuO_2$ (A: Ca-Sr-Ba) constitute the simplest copper oxygen perovskites that contain the CuO_2 sheets essential for superconductivity. The stabilization of these basic "building blocks" as epitaxial films, therefore, provides alluring opportunities towards the search for new superconducting compounds and elucidation of the underlying mechanisms. In this work, general trends of the defect formation and carrier doping for epitaxial films of the intermediate endmember $SrCuO_2$ are reviewed. First results are presented from successful attempts to induce hole-doped superconductivity via the processing-controlled incorporation of charge reservoir layers.

21617 (CONF-950637–2) **Effect of the colony microstructure on transport critical current of high-J_c Tl-1223 thick films.** Goyal, A. (Argonne National Lab., IL (United States)); Specht, E.D.; Kroeger, D.M.; Christen, D.K.; Tkaczyk, J.E.; DeLuca, J.A.; Sutliff, J.A. Oak Ridge National Lab., TN (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International workshop on superconductivity: controlled processing of high temperature superconductors - fundamentals and applications; Maui, HI (United States); 18-21 Jun 1995. Order Number DE95013049. Source: OSTI; NTIS; GPO Dep.

High J_c, polycrystalline, $TlBa_2Ca_2Cu_3O_{8+x}$ thick films on poly-YSZ substrates were examined by x-ray microdiffraction, electron microscopy, and electron backscatter diffraction. The superconducting phase was formed by vapor phase thallination. X-ray phi scans were used to study the local and macroscopic in-plane texture. Electron backscatter kikuchi diffraction was used to discern the grains structure within the colonies. Figure shows results of a limiting path calculation of J_c vs colony mosaic.

21618 (CONF-9508127–1) **R-curve behavior of whisker-reinforced ceramic composites.** Hsueh, Chun-Hway; Becher, P.F. Oak Ridge National Lab., TN (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 2. international conference on high temperature ceramic matrix composites; Santa Barbara, CA (United States); 21-25 Aug 1995. Order Number DE95012873. Source: OSTI; NTIS; GPO Dep.

Ceramics have attracted great interest for advanced heat engines and industrial applications as a result of their stiffness, light weight, corrosion resistance, and superior performance at high temperatures. However, their utilization in engineering applications is severely limited by their brittleness. One approach toward substantially reducing this brittleness is by incorporating strong whiskers into the ceramic matrix. Studies of whisker-reinforced ceramic composites have shown both rising fracture resistance with crack extension (i.e. R-curve behavior) and a three- to four-fold increase in steady-state toughness. The primary toughening mechanism is bridging of the crack surface by whiskers. This paper discusses the bridging mechanism in detail and presents R-curves for SiC whisker-reinforced Al_2O_3 composites.

21619 (ETDE/JP-mf–95787249) **Researches on tungsten carbide.** National Inst. for Researches in Inorganic Materials, Tsukuba, Ibaraki (Japan). 24 Nov 1994. 80p. (In Japanese). Order Number DE95787249. Source: OSTI; NTIS; Available from National Institute for Research in Inorganic Materials, 1-1, Namiki, Tsukuba, Ibaraki, Japan.

This paper summarizes results of the researches on tungsten carbide (WC), carried out in the 5-year period starting 1989 by the Science and Technology Agency's National Institute for Researches in Inorganic Materials. The high-frequency heating, floating zone technique, generally suited for growth of large-size, single crystals of high melting materials, is inapplicable to the hexagonal WC system, which is decomposed. This problem has been solved by adding boron to the system, to allow it to exist with the W-C-B melt at an equilibrium. The computer-aided control techniques have enabled automatic growth of the single crystals of carbides and borides. The de Haas-Van Alphen effect of the single WC crystals has been observed, to establish the Fermi surface model. The single crystals of transition metal carbides, such as WC, have been coated with the monolayer of graphite at high repeatability, to create the surface layer materials. An attempt has been done to produce the halite type structure by substituting Ti as the atom in the outermost layer of TiC by W. The new method, based on the low-speed deuterium ion scattering, has been developed to analyze the surface bonding conditions, clarifying the conditions of alkalis adsorbed on and bonded to metallic surfaces, and their surface reactivities. 159 refs., 111 figs., 8 tabs.

21620 (FEI–2358) **Metal-insulator phase transitions in the systems with dipole-dipole interaction.** Plaksin, O.A.; Stepanov, V.A. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1994. 17p. (In Russian). Order Number DE95633129. Source: OSTI; NTIS (US Sales Only); INIS.

An approach to metal-insulator phase transitions (MIPT) concerning with dipole-dipole interaction in systems has been introduced. Along with dipole states owing to local structural distortions there localized electrons states are considered in Hamiltonian.

Concentration of delocalized electrons is an objective parameter of the model. Phase diagrams have been determined. Jump-wise increase of the concentration of delocalized electrons on heating has been obtained (MIPT). MIPT of the first order can take place in both two-phase regions or single-phase regions of the phase diagram. Parameters of MIPT in VO_2, V_2O_3, Ti_2O_3, Fe_3O_4, $NbCl_4$ have been estimated. 5 refs.; 4 figs.; 1 tab.

21621 (INIS-mf–15113) **Molecular beam epitaxy of high-Tc superconductors. Final report.** Dietsche, W.; Eissler, D.; Fischer, A.; Kershaw, Y.; Ploog, K.; Wang, H.S. Max-Planck-Institut fuer Festkoerperforschung, Stuttgart (Germany). 1993. 98p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 13N5805. Order Number DE95785525. Source: OSTI; NTIS (US Sales Only); INIS.

The document discusses the preparation of $DyBa_2Cu_3O_7$-δ-films by MBE in detail. The structural properties of the high-temperature superconducting films are examined by means of the atomic scanning tunneling and the atomic force microscopy, as well as by means of X-ray techniques, and are brought in relation with the superconducting properties. The surface of the $SrTiO_3$-substrates is studied in detail by atomic force microscopy. (orig.)

21622 (LA-SUB–95-63) **A new US manufacturing capability of glass preforms for fiber optics in defense programs. Final project report.** Nath, D.K. (Polymicro Technologies, Inc., Phoenix, AZ (United States)). Los Alamos National Lab., NM (United States); Polymicro Technologies, Inc., Phoenix, AZ (United States). Jun 1992. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95012078. Source: OSTI; NTIS; GPO Dep.

The present project is a part of the program to develop "A New US Manufacturing Capability of Fiber Optics in Defense Programs." The scope of the program extends beyond the limit of defense needs, impacting profoundly on important national issues such as, health industry vis-a-vis medical and insurance infrastructure as well as a great segment of commercial-industrial complex. At present, the glass preform – critical raw material to produce the optical fiber, is 100% imported from Germany and Japan. Objectively, to create a domestic source, a cooperative project participated by Los Alamos and Polymicro began in the summer of 1991 to develop the cladding part of the glass preform. The goal was achieved by developing 0·2NA preform, that was fabricated by Modified Chemical Vapor Deposition (MCVD) of born and fluorine doped silica glass as cladding layer on a silica substrate tube and collapsing the tube on a solid silica rod as the core. The preform was finally drawn into 200 micron core optical fiber and delivered to Los Alamos National Laboratory.

21623 (LA-UR–94-1148, pp. 552-555) **Impurities: A smoking gun for the physical origin of high temperature superconductivity.** Pines, D. (Physics Department and Science and Technology Center for Superconductivity, Urbana, IL (United States)). Los Alamos National Lab., NM (United States). [1994]. Grant DMR 91-20000; Grant PHY 89-04035. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM (United States), 15-18 Dec 1993). In *Proceedings, strongly correlated electronic materials: The Los Alamos symposium 1993.* 662p. Order Number DE94009293. Source: OSTI; NTIS; INIS.

Philippe Monthoux and the author have recently carried out detailed strong coupling (Eliashberg) calculations for $YBa_2Cu_3O_7$ of the influence of impurities on the normal state quasiparticle self-energy and resistivity, and the superconducting transition temperature, T_c. They find, in agreement with experiment, that although both Ni and Zn impurities primarily substitute for planar Cu(2) atoms, their influence on T_c is markedly different. That difference arises from the experimental fact that Zn, when substituted for Cu(2), alters the local magnetic order, and hence the local spin fluctuation spectrum, while Ni does not. This difference is the equivalent of the isotope effect for conventional superconductors: it is a smoking gun for the physical origin of high temperature superconductivity and provides strong evidence for the spin-fluctuation mechanism, and the $d_{x^2-y^2}$ pairing state to which it gives rise.

21624 (LA-UR–94-1148, pp. 601-604) **Strongly anisotropic s-wave vs. d-wave gap in cuprate superconductors: Evidence and theory.** Brandow, B. (Los Alamos National Laboratory, NM (United States)). Los Alamos National Lab., NM (United States). [1994]. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM (United States), 15-18 Dec 1993). In *Proceedings, strongly correlated electronic materials: The Los Alamos symposium 1993.* 662p. Order Number DE94009293. Source: OSTI; NTIS; INIS.

Most of the evidence supporting a d-wave gap form can be explained equally well by a highly anisotropic s-wave gap form. The latter is supported by further experimental evidence and by a dynamical argument, as well as by nearly ab initio calculations based on a systematic theory. As is well known, the d-wave gap scenario for cuprate superconductors has strong support from several lines of evidence: (1) Evidence for strong gap anisotropy, e.g. the Stanford photoemission data. (2) Evidence for gap nodes, e.g. the UBC studies of penetration depth $\lambda_L(T)$ at low T ($\ll T_c$). (3) A pairing interaction based on the strong quasiparticle repulsion at $q=(\pi,\pi)$, the latter being clearly established from inelastic neutron scattering and NMR data. Furthermore, (4) the phenomenological theory also provides a source for the strong (and linear) resistivity. The d-wave gap scenariao and theory are therfore very plausible.

21625 (LBL–35424) **Characterization of superconductors with artificial pinning microstructures.** Dietderich, D.R.; Scanlan, R.M. Lawrence Berkeley Lab., CA (United States). Oct 1994. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-941013–48: Applied superconductivity conference, Boston, MA (United States), 16-21 Oct 1994). Order Number DE95012391. Source: OSTI; NTIS; INIS; GPO Dep.

Extension of the APC approach to Nb_3Sn requires that a second phase be introduced into the Nb_3S reaction layer with the intent of increasing the volume pinning strength. This can be achieved by either the refinement of the Nb_3S grains due to the presence of a second phase or by the second phase itself pinning flux. If a bronze-type process is to be used a different addition than Zr is required since internal oxidation of Nb is not possible. The criteria for elements to be candidates for the APC approach are discussed. The results for one of the candidates (Ag) show that it is not incorporated into the Nb_3S, however, its addition did increase the growth rate.

21626 (LBL–36924) **Processing and characterization of SIC platelet/SIC composites.** Cao, J.J.; MoberlyChan, W.J.; De Jonghe, L.C.; Dalgleish, B.; Niu, M.Y. Lawrence Berkeley Lab., CA (United States). Mar 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-940416–34: 96. annual meeting of the American Ceramic Society (ACS), Indianapolis, IN (United States), 25-28 Apr 1994). Order Number DE95012381. Source: OSTI; NTIS; GPO Dep.

Hot pressed β-SiC and SiC matrix composites containing encapsulated α-SiC platelets were prepared and investigated. The Microstructures were characterized using electron microscopy, Auger electron spectroscopy, and x-ray diffraction. Prior to hot pressing, the platelets were either encapsulated with hydrated aluminum sulfate or yttrium hydroxycarbonate (later calcined to form alumina or yttria) from aqueous solutions, or oxidized to form a silica layer. The effect of these interfacial layers on toughness was described.

21627 (ORNL/SUB–85-55901/05) **Finite-volume model for chemical vapor infiltration incorporating radiant heat transfer. Interim report.** Smith, A.W. (Georgia Institute of Technology, Atlanta, GA (United States). School of Materials Science and Engineering); Starr, T.L. Oak Ridge National Lab., TN (United States); Georgia Inst. of Tech., Atlanta, GA (United States). School of Materials Science and Engineering. May 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95012164. Source: OSTI; NTIS; GPO Dep.

Most finite-volume thermal models account for the diffusion and convection of heat and may include volume heating. However, for certain simulation geometries, a large percentage of heat flux is due to thermal radiation. In this paper a finite-volume computational procedure for the simulation of heat transfer by conduction,

convection and radiation in three dimensional complex enclosures is developed. The radiant heat transfer is included as a source term in each volume element which is derived by Monte Carlo ray tracing from all possible radiating and absorbing faces. The importance of radiative heat transfer is illustrated in the modeling of chemical vapor infiltration (CVI) of tubes. The temperature profile through the tube preform matches experimental measurements only when radiation is included. An alternative, empirical approach using an "effective" thermal conductivity for the gas space can match the initial temperature profile but does not match temperature changes that occur during preform densification.

21628 (PNL-SA-25315) **Influence of processing variables on the structure and properties of ZnO films.** Exarhos, G.J. (Pacific Northwest Lab., Richland, WA (United States)); Sharma, S.K. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950454-2: 22. international AVS conference on metallurgical coatings and thin films, San Diego, CA (United States), 24-28 Apr 1995). Order Number DE95011494. Source: OSTI; NTIS; GPO Dep.

Zinc oxide films of high optical quality have been deposited onto both silica and silicon substrates using reactive sputtering, pulsed laser deposition, and an aqueous solution based technique. Films have been characterized with respect to crystalline phase and phase stability, surface morphology, and optical response by means of X-ray diffraction, Raman Spectroscopy, Atomic Force Microscopy, optical transmission and ellipsometry measurements. All films studied were of the wurtzite phase, fine-grained, and exhibited varying degrees of c-axis orientation with respect to the substrate normal depending upon deposition conditions. Films showed some degree of residual tensile stress which was inferred from the E_2 Raman line shift relative to the single crystal frequency. The wurtzite phase was found to be stable to temperatures near 800°C, but at higher temperatures, reaction with silica led to evolution of Zn_2SiO_4 at the interface. Variations in Raman line intensities upon post deposition annealing has been correlated with oxidation of excess zinc in the lattice.

21629 (RISO-R-796(EN)) **Perovskite-type metal oxides. Electrical conductivity and structure.** Ranloev, J. Risoe National Lab., Roskilde (Denmark). Materials Dept. Jan 1995. 133p. Order Number DE95779167. Source: OSTI; NTIS; Also available from Risoe Library, P.O. Box 49, DK-4000 Roskilde, Denmark.

Structural behavior and electrical conductivity of these materials varies strongly with the chemical composition. This work describes the results of a systematic investigation of the interrelationship of crystal structure and ionic conductivity for selected members of the perovskite-type metal oxides. These include acceptor doped $SrCeO_3$ and $Ln[Al_{0.95}Mg_{0.05}]O_{3-y}$ (Ln = La, Nd, Sm, Gd, Tb, Er and Y). (au) (19 tabs., 62 ills., 136 refs.)

21630 (SAND-94-3266) **Dynamic properties of ceramic materials.** Grady, D.E. (Sandia National Labs., Albuquerque, NM (United States). Experimental Impact Physics Dept.). Sandia National Labs., Albuquerque, NM (United States). Feb 1995. 99p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95010333. Source: OSTI; NTIS; INIS; GPO Dep.

The present study offers new data and analysis on the transient shock strength and equation-of-state properties of ceramics. Various dynamic data on nine high strength ceramics are provided with wave profile measurements, through velocity interferometry techniques, the principal observable. Compressive failure in the shock wave front, with emphasis on brittle versus ductile mechanisms of deformation, is examined in some detail. Extensive spall strength data are provided and related to the theoretical spall strength, and to energy-based theories of the spall process. Failure waves, as a mechanism of deformation in the transient shock process, are examined. Strength and equation-of-state analysis of shock data on silicon carbide, boron carbide, tungsten carbide, silicon dioxide and aluminum nitride is presented with particular emphasis on phase transition properties for the latter two. Wave profile measurements on selected ceramics are investigated for evidence of rate sensitive elastic precursor decay in the shock front failure process.

21631 (SAND-95-0500) **Analysis of the frequency response of a TeO_2 slow shear wave acousto-optic cell exposed to radiation.** Erteza, I.A. Sandia National Labs., Albuquerque, NM (United States). Apr 1995. 39p. Sponsored by USDOE, Washington, DC (United States);Defense Nuclear Agency, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95012520. Source: OSTI; NTIS; GPO Dep.

Radiation testing of photonic components is not new, however component level testing to date has not completely addressed quantities which are important to system behavior. One characteristic that is of particular importance for optical processing systems is the frequency response. In this report, we present the analysis of data from an experiment designed to provide a preliminary understanding of the effects of radiation on the frequency response of acousto-optic devices. The goal of the analysis is to describe possible physical mechanisms responsible for the radiation effects and to discuss the effects on signal processing functionality. The experiment discussed in this report was designed by Sandia National Laboratories and performed by Sandia and Phillips Laboratory personnel at White Sands Missile Range (WSMR). In the experiment, a TeO_2 slow shear wave acousto-optic cell was exposed to radiation from the WSMR linear accelerator. The TeO_2 cell was placed in an experimental configuration which allowed swept frequency diffracted power measurements to be taken during radiation exposure and recovery. A series of exposures was performed. Each exposure consisted of between 1 to 800, 1μsec radiation pulses (yielding exposures of 2.25 kRad(Si) to 913 kRad(Si)), followed by recovery time. At low total and cumulative doses, the bandshape of the frequency response (i.e. diffracted power vs. frequency) remained almost identical during and after radiation. At the higher exposures, however, the amplitude and width of the frequency response changed as the radiation continued, but returned to the original shape slowly after the radiation stopped and recovery proceeded. It is interesting to note that the location of the Bragg degeneracy does not change significantly with radiation. In this report, we discuss these effects from the perspective of anisotropic Bragg diffraction and momentum mismatch, and we discuss the effect on the signal processing functionality.

21632 (SAND-95-0595) **Electron beam joining of structural ceramics.** Turman, B.N.; Glass, S.J.; Halbleib, J.A.; Helmich, D.R.; Loehman, R.E. Sandia National Labs., Albuquerque, NM (United States). Apr 1995. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95012521. Source: OSTI; NTIS; GPO Dep.

Feasibility of ceramic joining using a high energy (10 MeV) electron beam. The experiments used refractory metals as bonding materials in buried interfaces between Si_3N_4 pieces. Because the heat capacity of the metal bonding layer is much lower than the ceramic, the metal reaches much higher temperatures than the adjoining ceramic. Using the right combination of beam parameters allows the metal to be melted without causing the adjoining ceramics to melt or decompose. Beam energy deposition and thermal simulations were performed to guide the experiments. Joints were shear tested and interfaces between the metal and the ceramic were examined to identify the bonding mechanism. Specimens joined by electron beams were compared to specimens produced by hot-pressing. Similar reactions occurred using both processes. Reactions between the metal and ceramic produced silicides that bond the metal to the ceramic. The molybdenum silicide reaction products appeared to be more brittle than the platinum silicides. Si_3N_4 was also joined to Si_3 N_4 directly. The bonding appears to have been produced by the flow of intergranular glass into the interface. Shear strength was similar to the metal bonded specimens. Bend specimens Of Si_3N_4 were exposed to electron beams with similar parameters to those used in joining experiments to determine how beam exposure degrades the strength. Damage was macroscopic in nature with craters being tonned by material ablation, and cracking occurring due to excessive thermal stresses. Si was also observed on the surface indicating the Si_3N_4 was decomposing. Bend strength after exposure was 62% of the asreceived strength. No obvious microstructural differences were observed in the material close to the damaged region compared to material in regions far away from the damage.

21633 (SAND–95-0934C) **Synthesis of silicon nitride powders in pulsed RF plasmas.** Buss, R.J. (Sandia National Labs., Albuquerque, NM (United States)); Ho, P.; Babu, S.V. Sandia National Labs., Albuquerque, NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9505204–1: 9, annual conference on fossil energy materials, Oak Ridge, TN (United States), 16-18 May 1995). Order Number DE95011607. Source: OSTI; NTIS; GPO Dep.

Nanometer size silicon nitride particles are synthesized using a pulsed radio frequency plasma technique. The plasma is modulated with a square-wave on/off cycle of varying period to control size and morphology and to deduce the growth kinetics. In situ laser light scattering and ex situ particle analysis are used to study the nucleation and growth. For SiH_4/Ar plasmas which nucleate silicon particles, an initial extremely rapid growth phase is followed by a slower growth rate, approaching the rate of thin film deposition on adjacent flat surfaces. In SiH_4/NH_3 plasmas, silicon nitride particle size can be tightly controlled by adjusting the plasma-on time. The size dispersion of the particles is large and is consistent with a process of continual nucleation during the plasma-on period. The observed polydispersity differs dramatically from that reported from other laboratories.

21634 (SAND–95-0936C) **High rate dry etching of GaN, AlN and InN in ECR $Cl_2/CH_4/H_2$/Ar plasmas.** Vartuli, C.B. (Univ. of Florida, Gainesville, FL (United States)); Pearton, S.J.; Abernathy, C.R.; Shul, R.J.; Kilcoyne, S.P.; Crawford, M.H.; Howard, A.J.; Parmeter, J.E. Sandia National Labs., Albuquerque, NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950412–12: Spring meeting of the Materials Research Society (MRS), San Francisco, CA (United States), 17-21 Apr 1995). Order Number DE95011872. Source: OSTI; NTIS; GPO Dep.

Etch rates for binary nitrides in ECR $Cl_2/CH_4/H_2$/Ar are reported as a function of temperature, rf-bias, microwave power, pressure and relative gas proportions. GaN etch rates remain relatively constant from 30 to 125°C and then increase to a maximum of 2340 Å-min^{-1} at 170°C. The AlN etch rate decreases throughout the temperature range studied with a maximum of 960 Å-min^{-1} at 30°C. When CH_4 is removed from the plasma chemistry, the GaN and InN etch rates are slightly lower, with less dramatic changes with temperature. The surface composition of the III-V nitrides remains unchanged over the temperatures studied. The GaN and InN rates increase significantly with rf power, and the fastest rates for all three binaries are obtained at 2 mTorr. Surface morphology is smooth for GaN over a wide range of conditions, whereas InN surfaces are more sensitive to plasma parameters.

21635 (SAND–95-8518C) **Planar laser-induced fluorescence imaging of Si and SIO during pulsed laser ablation of Si.** Paul, P.H. (Sandia National Labs., Livermore, CA (United States). Combustion Research Facility); Capewell, D.L.; Goodwin, D.G. Sandia National Labs., Livermore, CA (United States). 4 Feb 1995. 10p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950226–45: SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine, San Jose, CA (United States), 5-14 Feb 1995). Order Number DE95010698. Source: OSTI; NTIS; GPO Dep.

Pulsed laser deposition (PLD) in the presence of oxygen is an attractive method to deposit oxide films. However, the factors governing oxide film growth are still very poorly understood, due largely to the complexity of this process. Some of the important features of PLD with a background gas are the absorption of laser energy by the target and by electrons in the plasma above the target, the supersonic expansion of the hot plasma particles into the background gas, chemistry within the plume or between plume species and background molecules, and finally the impact of plume species, shock-heated background gas molecules, and reactive intermediates created by gas-phase chemistry with the substrate. Time-resolved imaging of the plume can shed light on some of these complex processes. Ideally, one would like to acquire temporally- and spatially-resolved images of individual chemical species in their electronic ground states, since these provide the greatest insight into the chemistry and are most directly comparable to numerical simulations. Here, planar laser induced fluorescence has been used to acquire time sequence images of ground-state, neutral Si and SiO during laser ablation of an Si target in vacuum and in the presence of background gas at a fluence of 3–4 J/cm^2. The SiO images, taken in air and in oxygen, strongly suggest that the observed SiO is created through reaction of silicon with oxygen at the contact front as the plume expands.

21636 (UCRL-JC–119217) **Superplastic ceramics and intermetallics and their potential applications.** Wadsworth, J.; Nieh, T.G. Lawrence Livermore National Lab., CA (United States). Nov 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-941270–1: Superplasticity - 60 years after Pearson conference, Manchester (United Kingdom), 7-8 Dec 1994). Order Number DE95013454. Source: OSTI; NTIS; INIS; GPO Dep.

Recent advances in the basic understanding of superplasticity and superplastic forming of ceramics and intermetallics are reviewed. Fine-grained superplastic ceramics, including yttria-stabilized tetragonal zirconia polycrystal, Y- or MgO-doped Al_2O_3 Hydroxyapatite, β-spodumene glass ceramics, Al_20_3-YTZP two-phase composites, SiC-Si_3N_4 and Fe-Fe_3C composites, are discussed. Superplasticity in the nickel-base (e.g., Ni_3Al and Ni_3Si) and titanium-base intermetallics (TiAl and $T1_3Al$), is described. Deformation mechanisms as well as microstructural requirements and effects such as grain size, grain growth, and grain-boundary phases, on the superplastic deformation behavior am addressed. Factors that control the superplastic tensile elongation of ceramics are discussed. Superplastic forming, and particularly biaxial gas-pressure forming, of several ceramics and intermetallics are presented with comments on the likelihood of commercial application.

21637 (ANL/CHM/CP–85037) **In situ surface roughness measurement during PECVD diamond film growth.** Zuiker, C.D.; Gruen, D.M.; Krauss, A.R. Argonne National Lab., IL (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9505192–2: 4. international symposium on diamond materials, Reno, NV (United States), 21-26 May 1995). Order Number DE95013411. Source: OSTI; NTIS; GPO Dep.

To investigate the development of surface morphology and bulk optical attenuation in diamond films, we have followed diamond film growth on silicon by in-situ laser reflection interferometry in a microwave plasma chemical vapor deposition system. A model for the interpretation of the reflectivity data in terms of film thickness, rms surface roughness and bulk losses due to scattering and absorption is presented. Results are compared with ex situ measurements of these quantities and found to be in good agreement.

21638 (ANL/CHM/CP–85655) **XUV postionization of fragments of photodissociated C_{60}.** Lykke, K.R. Argonne National Lab., IL (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950518–9: 187. meeting of the Electrochemical Society, Reno, NV (United States), 21-26 May 1995). Order Number DE95013534. Source: OSTI; NTIS; GPO Dep.

We report experimental evidence for the loss of neutral C, C_2, C_3, and C_4 from photoexcited C_{60} and C_{70}. These species are detected by postionization with XUV radiation formed by four-wave mixing in Kr vapor. The fragments have been detected in the nascent distribution (i.e., before total disintegration of the fullerene-size molecular entities). A resonant autoionization transition in C atom has yielded an upper limit to the translational energy release

for dissociation into C atoms. The detection of these products gives new insight into the fragmentation mechanism of fullerenes.

21639 (ANL/CHM/CP–86016) **Physical and tribological properties of diamond films grown in argon-carbon plasmas.** Zuiker, C.; Krauss, A.R.; Gruen, D.M.; Pan, X.; Li, J.C.; Csencsits, R.; Erdemir, A.; Bindal, C.; Fenske, G. Argonne National Lab., IL (United States). [1995]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950454–5: 22. international AVS conference on metallurgical coatings and thin films, San Diego, CA (United States), 24-28 Apr 1995). Order Number DE95012918. Source: OSTI; NTIS; GPO Dep.

Nanocrystalline diamond films have been deposited using a microwave plasma consisting of argon, 2–10% hydrogen and a carbon precursor such as C_{60} or CH_4. It was found that it is possible to grow the diamond phase with both carbon precursors, although the hydrogen concentration in the plasma was 1–2 orders of magnitude lower than normally required in the absence of the argon. Auger electron spectroscopy, x-ray diffraction measurements and transmission electron microscopy indicate the films are predominantly composed of diamond. Surface roughness, as determined by atomic force microscopy and scanning electron microscopy indicate the nanocrystalline films grown in low hydrogen content plasmas grow exceptionally smooth (30–50 nm) to thicknesses of 10 μm. The smooth nanocrystalline films result in low friction coefficients (μ=0.04–0.06) and low average wear rates as determined by pin-on-disk measurements.

21640 (ANL/ET/CP–85882) **Characterization of transfer layers on steel surfaces sliding against diamondlike carbon in dry nitrogen.** Erdemir, A. (Argonne National Lab., IL (United States)); Bindal, C.; Pagan, J.; Wilbur, P. Argonne National Lab., IL (United States). Mar 1995. 21p. Sponsored by USDOE, Washington, DC (United States);Camlica Foundation of Istanbul (Turkey);Sakarya Univ. (Turkey). DOE Contract W-31-109-ENG-38. (CONF-950454–3: 22. international AVS conference on metallurgical coatings and thin films, San Diego, CA (United States), 24-28 Apr 1995). Order Number DE95012927. Source: OSTI; NTIS; GPO Dep.

Transfer layers on sliding steel surfaces play important roles in tribological performance of diamondlike carbon films. This study investigated the nature of transfer layers formed on M50 balls during sliding against diamondlike carbon (DLC) films (1.5 μm thick) prepared by ion-beam deposition. Long-duration sliding tests were performed with steel balls sliding against the DLC coatings in dry nitrogen at room temperature and zero humidity. Test results indicated that the friction coefficients of test pairs were initially 0.12 but decreased steadily with sliding distance to 0.02-0.03 and remained constant throughout the tests, which lasted for more than 250,000 sliding cycles (30 km). This low-friction regime appeared to coincide with the formation of a carbon-rich transfer layer on the sliding surfaces of M50 balls. Micro-laser-Raman spectroscopy and electron microscopy were used to elucidate the structure and chemistry of these transfer layers and to reveal their possible role in the wear and friction behavior of DLC-coated surfaces.

21641 (ANL/MSD/CP–83373) **Epitaxial $Pb(Zr_{0.40}Ti_{0.60})O_3$/$SrRuO_3$ and $PbTiO_3$/$SrRuO_3$ multilayer thin films prepared by MOCVD and rf sputtering.** Foster, C.M. (and others); Csencsits, R.; Baldo, P.M. Argonne National Lab., IL (United States). Dec 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38 ; AC04-94AL85000. (SAND–95-1145C; CONF-941144–148: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95007146. Source: OSTI; NTIS; GPO Dep.

Epitaxial $SrRuO_3$ thin films were deposited by RF sputtering on $SrTiO_3$ or MgO substrates for use as underlying electrodes. On these conductive substrates, epitaxial $Pb(Zr_{0.35}Ti_{0.65})O_3$ (PZT) and $PbTiO_3$ (PT) thin films were, deposited by metalorganic chemical vapor deposition (MOCVD). X-ray diffraction (XRD), RBS channeling (RBS), transmission electron microscopy (TEM) and optical waveguiding were used to characterize phase, microstructure, defect structure, refractive index, and film thickness of the deposited films. The PZT and PT films were epitaxial and c-axis oriented. 90° domains, interfacial misfit dislocations and dislocations and threading dislocations were the primary structural defects, and the films showed a 70% RBS channeling reduction. Hysteresis and dielectric measurements of epitaxial PZT ferroelectric capacitor structures formed using evaporated Ag or ITO glass top electrode showed: a remanent polarization of 46.2 mC/cm^2, a coercive field of 54.9 KV/cm, a dielectric constant of 410, a bipolar resistivity of $\sim 5.8 \times 10^9$ Ω-cm at a field of 275 KV/cm, and a breakdown strength of >400 KV/cm.

21642 (ANL/MSD/PP–77687) **Surface brillouin scattering from graphite.** Grimsditch, M. Argonne National Lab., IL (United States). Oct 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95012209. Source: OSTI; NTIS; GPO Dep.

This report discusses the conflicting results of two previous Brillouin scattering determinations of the C_{44} elastic modulus of graphite.

21643 (CONF-950129–9) **Oxidation-resistant interfacial coatings for continuous fiber ceramic composites.** Shanmugham, S. (Tennessee Univ., Knoxville, TN (United States)); Liaw, P.K.; Stinton, D.P.; Bleier, A.; Besmann, T.M.; Lara-Curzio, E.; Rebillat, F. Oak Ridge National Lab., TN (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 19. annual conference on advanced ceramics, materials and structures; Cocoa Beach, FL (United States); 9-12 Jan 1995. Order Number DE95013354. Source: OSTI; NTIS; GPO Dep.

Developing an oxidation-resistant interfacial coating for continuous fiber ceramic composites (CFCCs) continues to be a major challenge. CFCCs' mechanical behavior are influenced by the interfacial bonding characteristics between the fiber and the matrix. Finite element modeling studies suggest that a low-modulus interfacial coating material will be effective in reducing the residual thermal stresses that are generated upon cooling from processing temperatures. Nicalon/SiC composites with carbon, alumina and mullite interfacial coatings were fabricated with the SiC matrix deposited using a forced-flow chemical vapor infiltration process. Composites with mullite interfacial coatings exhibited considerable fiber pull-out even after oxidation and have potential as a composite system.

21644 (CONF-950412–14) **Modeling and simulation of pulsed laser annealing and ablation of solid materials.** Liu, C.L.; Wood, R.F. Oak Ridge National Lab., TN (United States). Apr 1995. 8p. Sponsored by USDOE, Washington, DC (United States);Oak Ridge Inst. for Science and Education, TN (United States). DOE Contract AC05-84OR21400. From Spring meeting of the Materials Research Society (MRS); San Francisco, CA (United States); 17-21 Apr 1995. Order Number DE95012888. Source: OSTI; NTIS; GPO Dep.

A previously developed one-dimensional (ID) computational model for heat flow and nonequilibrium phase change phenomena induced by pulsed-laser irradiation has been extended to two-dimensions. The 2D modeling focuses attention on the heat flow from localized sources embedded in an otherwise planar matrix. For example, nucleation events occurring in undercooled liquids such as molten Si formed by pulsed-laser melting of amorphous Si (a-Si) and inhomogeneous absorption due to randomly occurring defects in targets used for pulsed-laser ablation can be treated. Concepts introduced in the ID modeling, such as the state diagram and the state array are extended to 2D and refined. As an example of the calculations that are now possible, the laser-induced formation and propagation of buried liquid layers are followed in two dimensions for the case of a-Si on a crystalline silicon substrate. It is demonstrated how solid phase growth from individual nucleation sites gives rise to a nearly planar liquid layer propagating through the a-Si. Another example briefly addresses questions related to the early stages of the laser ablation of insulators such as MgO, where it is believed that the absorption of the laser radiation occurs at localized but extended regions of high concentrations of defects. The 2-D program has been rewritten for massively parallel machines such as the Intel Paragons in ORNL's Center for Computational Sciences by one of us (CLL), thus allowing larger and

more accurate calculations for complex systems to be carried out in reasonable times.

21645 (CONF-9505219–1) **Formation of artificially-layered high-temperature superconductors using pulsed-laser deposition.** Norton, D.P.; Chakoumakos, B.C.; Budai, J.D. Oak Ridge National Lab., TN (United States). Mar 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 3. international conference on laser ablation (COLA '95); Strasbourg (France); 22-26 May 1995. Order Number DE95012884. Source: OSTI; NTIS; GPO Dep.

Pulsed-laser deposition has been used to synthesize artificially-layered high-temperature superconductors. Novel thin-film $SrCuO_2$/$BaCuO_2$ superlattices have been synthesized which superconduct at temperatures as high as 70 K. These results demonstrate that pulsed-laser deposition and epitaxial stabilization can be effectively used to engineer artificially-layered thin-film materials.

21646 (CONF-950820–1) **Highly doped p-ZnTe films and quantum well structures grown by nonequilibrium pulsed laser ablation.** Lowndes, D.H. (Oak Ridge National lab., TN (United States). Solid State Div.); Rouleau, C.M.; Budai, J.D.; Geohegan, D.B.; McCamy, J.W. Oak Ridge National Lab., TN (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 11. international conference on the electronic properties of two dimensional systems; Nottingham (United Kingdom); 7-11 Aug 1995. Order Number DE95012885. Source: OSTI; NTIS; GPO Dep.

Highly p-doped ZnTe films have been grown on semi-insulating GaAs (001) and unintentionally doped (p-type) GaSb (001) substrates by pulsed KrF (248 nm) excimer laser ablation of a ZnTe target through an N_2 ambient, without the use of any assisting (DC or AC) plasma source. Free hole concentrations in the mid-10^{19} cm^{-3} to $> 10^{20}$ cm^{-3} range have been obtained. This appears to be the first time that any wide band gap ($E_g \geq 2$ eV) II-VI compound (or other) semiconductor has been impurity-doped from the gas phase by pulsed-laser ablation (PLA). The maximum carrier concentrations also may be the highest obtained for ZnTe by any method thus far. Because pulsed laser deposition is inherently digital, attractive deposition rates can be combined with precise control of layer thickness in epitaxial multilayered structures. Typical deposition conditions are < 0.5 Å per laser pulse, with crystalline quality governed by tradeoffs between substrate temperature, pulse repetition rate, and the focused pulsed laser energy density. PLA's capability for growth of very thin epitaxial layers is being exploited and studied through growth of doped heteroepitaxial quantum well structures in the nearly lattice-matched ZnTe/CdSe// GaSb(substrate) system. Results obtained from growth and characterization of heterostructures in this system will be presented.

21647 (CONF-950865–2) **A background subtraction routine for enhancing energy-filtered plasmon images of $MgAl_2O_4$ implanted with Al^+ and Mg^+ ions.** Evans, N.D. (Oak Ridge Inst. for Science and Education, TN (United States)); Kenik, E.A.; Bentley, J.; Zinkle, S.J. Oak Ridge National Lab., TN (United States); Oak Ridge Inst. for Science and Education, TN (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ; AC05-76OR00033. From 29. annual meeting of the Microbeam Analysis Society; Breckenridge, CO (United States); 6-11 Aug 1995. Order Number DE95012850. Source: OSTI; NTIS; INIS; GPO Dep.

$MgAl_2O_4$, a candidate fusion reactor material, was irradiated with Al^+ or Mg^+ ions; electron energy-loss spectra and energy-filtered plasmon images showed that metallic Al colloids are present in the ion-irradiated regions. This paper shows the subtraction of the spinel plasmon component in images using 15-eV-loss electrons in some detail.

21648 (DOE/ER/45361–3) **Deposition of a-SiC:H, a-SiO_2 and tetrahedral-C with programmable in-situ etching. Final performance report, March 1, 1988–November 30, 1991.** Collis, W.J. North Carolina Agricultural and Technical State Univ., Greensboro, NC (United States). Dept. of Electrical Engineering. [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-88ER45361. Order Number DE95012950. Source: OSTI; NTIS; GPO Dep.

This research program was originally defined to investigate the deposition of semiconductor and dielectric thin films using a low pressure remote plasma chemical vapor deposition system incorporating a process for etching the films. This etching was to be performed in a periodic fashion during the deposition process to remove defect regions in the film being deposited. The goal was to remove voids and other defects which are characteristic of low temperature deposition processes. While the original research proposal suggested that the studies include the amorphous alloys (Si/C):H and (Si/Ge):H, subsequent funding reductions limited the work to the deposition of an amorphous silicon alloy material (a-Si:H). Intrinsic and doped forms of these materials have applications in the fabrication of single and multi-junction thin film solar cells.

21649 (DOE/ER/45441–T1) **The heavy electron state. Final report, February 1, 1991–August 31, 1994.** Auerbach, A. Boston Univ., MA (United States). Dept. of Physics. 13 Feb 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER45441. Order Number DE95015113. Source: OSTI; NTIS; GPO Dep.

Theoretical studies of electron interactions in two families of novel materials were conducted. The temperature-concentration phase diagram of doped bismuthate superconductors was described using a coarse grained anisotropic Heisenberg model. A simplified model of electron interactions on buckminsterfullerene was studied. A simple model for electron-vibron interactions on charged buckminsterfullerene C_{60}^{n-}, was solved at both weak and strong couplings.

21650 (DOE/ER/45488–5) **Unusual behavior in the magnetic anisotropy of ultra-thin Co Sandwiches: The role of underlayers.** Marliere, C.; Engel, B.N.; Falco, C.M. Arizona Univ., Tucson, AZ (United States). Dept. of Physics. [1994]. 7p. Sponsored by USDOE, Washington, DC (United States);Centre National de la Recherche Scientifique (CNRS), 75 - Paris (France);North Atlantic Treaty Organization, Brussels (Belgium). DOE Contract FG03-93ER45488. (CONF-940829–4: 14. international colloquium on magnetic films and surfaces. Duesseldorf (Germany), 29 Aug - 2 sep 1994). Order Number DE95010612. Source: OSTI; NTIS; GPO Dep.

We have used it situ polar Kerr effect measurements to study tile magnetic anisotropy of X/Co/Y sandwich structures grown by MBE on Cu(111) buffers, where X and Y are variable thicknesses of Au. For fixed values of Y and in the case of an underlayer wedge, e.g. variable X value, we have found a sharp minimum in both coercive field and perpendicular anisotropy at ≈ 1 atomic layer of the Au underlayer. This anisotropy behavior is opposite to that of an Au overlayer deposited on a Co film, i.e. variable Y and fixed X.

21651 (DOE/ER/45531–1) **High-resolution magnetic imaging and investigations of thin-film magnetism with spin-polarized electron, ion and atom probes. Progress report, November 1, 1994–October 31, 1995.** Walters, G.K.; Dunning, F.B. Rice Univ., Houston, TX (United States). Apr 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-95ER45531. Order Number DE95012190. Source: OSTI; NTIS; INIS; GPO Dep.

This is a progress report for the period 1 November, 1994 to 31 October, 1995. Research during this grant year includes: (1) Completion of the Spin-Polarized Electron Energy Loss Spectroscopy (SPEELS) research program. (2) Design of an improved and much more intense metastable atom source that can also be converted to a Rydberg atom beam, for continuing studies utilizing Spin-Polarized Metastable (Atom) Deexcitation Spectroscopy (SPMDS), and to initiate new investigations of interactions of Rydberg atoms with surfaces. (3) Development of a spin-polarized He^+ ion source for studies of ion-surface interaction dynamics and epitaxially grown magnetic films utilizing Spin-Polarized Ion Neutralization Spectroscopy (SPINS).

21652 (FEI–2373) **Fluctuating spectroscopy of boron nitride graphite-like materials.** Stepanov, V.A.; Stepanov, P.A. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1994. 14p. (In Russian). Order Number DE95633166. Source: OSTI; NTIS (US Sales Only); INIS.

The Raman scattering and IR-reflection spectra of the materials based on graphite-like boron nitride are obtained. The BN-based materials are prepared by chemical vapor deposition (CVD) and reaction sintering. The long wavelength shifts of Raman bands and short wavelength shifts of IR bands are supposed to be caused by the formation of stacking faults in the hexagonal BN structure. The stacking faults concentration in boron nitride depends on the features of the preparing technologies. 8 refs.; 5 figs.; 1 tab.

21653 (HMI-B–523) **Gas transport in graphitic materials.** Hoinkis, E. Hahn-Meitner-Institut Berlin GmbH (Germany). Feb 1995. 56p. Order Number DE95785376. Source: OSTI; NTIS (US Sales Only); INIS.

The characterization of the gas transport properties of porous solids is of interest in several fields of science and technology. Many catalysts, adsorbents, soils, graphites and carbons are porous. The gas transport through most porous solids can be well described by the dusty gas model invented by Evans, Watson and Mason. This model includes all modes of gas tranport under steady-state conditions, which are Knudsen diffusion, combined Knudsen/continuum diffusion and continuum diffusion, both for gas pairs with equal and different molecular weights. In the absence of a pressure difference gas transport in a pore system can be described by the combined Knudsen/continuum diffusion coefficient D_1 for component 1 in the pores, the Knudsen diffusion coefficient D_{1K} in the pores, and the continuum diffusion coefficient D_{12} for a binary mixture in the pores. The resistance to stationary continuum diffusion of the pores is characterized by a geometrical factor $(\epsilon/\tau) < 1$, where ϵ is that part of the accessible porosity which is actually involved in steady state gas transport. ϵ/τ has been termed porosity to tortuosity ratio and is defined by $D_{12} = (\epsilon/\tau)D_{12}$, were D_{12} is the continuum diffusion coefficient for a binary mixture in free space. The Wicke-Kallenbach method was often used to measure D_1 as function of pressure. D_{12} and D_{1K} can be derived from a plot $1/D_1$ vs P, and ϵ/τ can be calculated since D_{12} is known. D_{1K} and the volume of dead end pores can be derived from transient measurements of the diffusional flux at low pressures. From D_{1K} the expression (ϵ/τ^c) anti l_{por} may be calculated, which characterizes the pore system for molecular diffusion, where collisions with the pore walls are predominant. (orig.)

21654 (LA-UR–95-1168) **Stress relaxation in discontinuously reinforced composites.** Shi, N. (Los Alamos National Lab., NM (United States)); Arsenault, R.J. Los Alamos National Lab., NM (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. GRANT N00014-91-J-1353. (CONF-9506181–1: Micromechanics and constitutive modeling of composite materials, Los Angeles, CA (United States), 28-30 Jun 1995). Order Number DE95010928. Source: OSTI; NTIS; GPO Dep.

It has been observed that in discontinuously-reinforced Al_2O_3/NiAl composites that as the reinforcement size increases the average density of dislocations generated from the relaxation of the thermal stresses increases, and the corresponding thermal residual stresses slightly decrease. Similar changes result when the reinforcement morphology changes from spheres to short fibers to continuous filaments. The changes of dislocation density and thermal residual stresses with respect to particle size are in contrast to those observed in the SiC/Al counterpart A previously developed simple model used to explain the SiC/Al data, which was based on prismatic dislocation punching, suggested that the density of the misfit dislocations decreases when the reinforcement size increases. In this investigation, a simple model is proposed to explain the anomaly in the development of thermal residual stresses and the generation of misfit dislocations as a function of the particle size and shape in Al_2O_3/NiAl composites. As a result of a lack of sufficient independent-slip-systems in low symmetry materials such as NiAl, plastic relaxation of the thermal stresses is severely constrained as compared to fcc Al. As such, plastic relaxation requires collaborative slips in an aggregate of grains. This only occurs when the length scale of the varying misfit thermal stress field is much larger than the average grain size. That is, the mechanism of plastic relaxation becomes operative when the reinforcement size increases.

21655 (LA-UR–95-1543) **Lattice polymer automata.** Rasmussen, S. (Los Alamos National Lab., NM (United States)); Smith, J.R. Los Alamos National Lab., NM (United States). [1995]. 27p. Sponsored by USDOE, Washington, DC (United States);Santa Fe Inst., NM (United States). DOE Contract W-7405-ENG-36. (CONF-9404261–1: Self-organization of biopolymers, Jena (Germany), 10-13 Apr 1994). Order Number DE95011980. Source: OSTI; NTIS; GPO Dep.

We present a new style of molecular dynamics and self-assembly simulation, the Lattice Polymer Automaton (LPA). In the LPA all interactions, including electromagnetic forces, are decomposed and communicated via propagating particles, "photons." The monomer-monomer bondforces, the molecular excluded volume forces, the longer range intermolecular forces, and the polymer-solvent interactions may all be modeled with propagating particles. The LPA approach differs significantly from both of the standard approaches, Monte Carlo lattice methods and Molecular Dynamics simulations. On the one hand, the LPA provides more realism than Monte Carlo methods, because it produces a time series of configurations of a single molecule, rather than a set of causally unrelated samples from a distribution of configurations. The LPA can therefore be used directly to study dynamical properties; one can in fact watch polymers move in real time. On the other hand, the LPA is fully discrete, and therefore much simpler than traditional Molecular Dynamics models, which are continuous and operate on much shorter time scales. Due to this simplicity it is possible to simulate longer real time periods, which should enable the study of molecular self-organization on workstations supercomputers are not needed.

21656 (LA-UR–95-1555) **Magnetostriction and thermal expansion of the Kondo semiconductor $Ce_3Bi_4Pt_3$.** Hundley, M.F. (Los Alamos National Lab., NM (United States)); Neumeier, J.J.; Thompson, J.D.; Lacerda, A.; Canfield, P.C. Los Alamos National Lab., NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9505186–1: 2. physical phenomena at high magnetic fields conference, Tallahassee, FL (United States), 6-9 May 1995). Order Number DE95011975. Source: OSTI; NTIS; GPO Dep.

We report dilatometric thermal expansion (α) and magnetostriction (λ) measurements on the Kondo semiconductor $Ce_3Bi_4Pt_3$ and its non-magnetic analog $La_3Bi_4Pt_3$ in fields to 100 kOe. The magnetic contribution to the thermal expansion of $Ce_3Bi_4Pt_3$ displays a broad maximum centered at 50 K, close to the temperature where the 4f specific heat is a maximum. The linear magnetostriction is anomalously large in $Ce_3Bi_4Pt_3$, with values that are characteristic of mixed-valent compounds ($\lambda_\perp = 3.26\times10^{-5}$, $\lambda_\parallel = -6.24\times10^{-5}$ in 100 kOe at 4 K). The volume magnetostriction is positive and a factor of ten smaller than the linear coefficients ($\lambda_V = 2.75\times10^{-6}$ in 100 kOe at 4 K). The volume magnetostriction is temperature-dependent, and peaks at 50 K. The data are considered in terms of a Grueneisen analysis that links the temperature-dependent magnetic susceptibility, thermal expansion, magnetostriction, bulk modulus, and specific heat of $Ce_3Bi_4Pt_3$ via temperature-dependent electronic and magnetic scaling parameters.

21657 (LBL–34499) **Scanning tunneling microscopy of Si donors in GaAs.** Zheng, J.F. (California Univ., Berkeley, CA (United States). Dept. of Materials Science); Weber, E.R.; Liu, X.; Newman, N.; Ogletree, D.F.; Salmeron, M.B. Lawrence Berkeley Lab., CA (United States). Jul 1993. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9307124–4: 17. international conference on defects in semiconductors, Gmunden (Austria), 18-23 Jul 1993). Order Number DE95011266. Source: OSTI; NTIS; GPO Dep.

Using scanning tunneling microscopy, we have identified and characterized Si donors (Si_{Ga}) in GaAs located on the (110) surface and in subsurface layers. Si_{Ga} on the surface shows localized features with characteristic structures in good agreement with a recent theoretical calculation. Si_{Ga} in subsurface layers appears as delocalized protrusions superimposed on the background lattice, which are interpreted in terms of the modification of the tunneling due to the tip-induced band bending perturbed by the Si_{Ga} Coulomb potential.

21658 (LBL–36696) **Charge-transfer gap closure in transition-metal halides under pressure.** Chen, A.L.; Yu, P.Y. Lawrence Berkeley Lab., CA (United States). Jan 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95011268. Source: OSTI; NTIS; GPO Dep.

Insulator-to-metal transition induced by pressure has been studied in three transition metal iodides: NiI_2, CoI_2 and FeI_2 using optical absorption and resistivity measurements at room temperature. Comparisons between the results obtained by these two techniques suggested that the closure of the charge-transfer gap is the principal mechanism responsible for the insulator-to-metal transition in these materials.

21659 (LBL–36900) **Predicting the transport properties of sedimentary rocks from microstructure.** Schlueter, E.M. Lawrence Livermore National Lab., CA (United States). ©Jan 1995. 299p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-89BC14475. Order Number DE95012363. Source: OSTI; NTIS; GPO Dep.

Understanding transport properties of sedimentary rocks, including permeability, relative permeability, and electrical conductivity, is of great importance for petroleum engineering, waste isolation, environmental restoration, and other applications. These transport properties axe controlled to a great extent by the pore structure. How pore geometry, topology, and the physics and chemistry of mineral-fluid and fluid-fluid interactions affect the flow of fluids through consolidated/partially consolidated porous media are investigated analytically and experimentally. Hydraulic and electrical conductivity of sedimentary rocks are predicted from the microscopic geometry of the pore space. Cross-sectional areas and perimeters of individual pores are estimated from two-dimensional scanning electron microscope (SEM) photomicrographs of rock sections. Results, using Berea, Boise, Massilon, and Saint-Gilles sandstones show close agreement between the predicted and measured permeabilities. Good to fair agreement is found in the case of electrical conductivity. In particular, good agreement is found for a poorly cemented rock such as Saint-Gilles sandstone, whereas the agreement is not very good for well-cemented rocks. The possible reasons for this are investigated. The surface conductance contribution of clay minerals to the overall electrical conductivity is assessed. The effect of partial hydrocarbon saturation on overall rock conductivity, and on the Archie saturation exponent, is discussed. The region of validity of the well-known Kozeny-Carman permeability formulae for consolidated porous media and their relationship to the microscopic spatial variations of channel dimensions are established. It is found that the permeabilities predicted by the Kozeny-Carman equations are valid within a factor of three of the observed values methods.

21660 (LBL–36903) **Predicting the permeability of sedimentary rocks from microstructure.** Schlueter, E.M. Lawrence Berkeley Lab., CA (United States); California Univ., Berkeley, CA (United States). Dept. of Materials Science and Mineral Engineering. Jan 1995. 85p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098 ; AC22-89BC14475. Order Number DE95012757. Source: OSTI; NTIS; GPO Dep.

Permeability is linked to other properties of porous media such as capillary pressure and relative permeability. In order to understand the relationships, one has to understand how all those properties are conditioned by the connectivity and geometrical properties of the pore space. In this study, we look at a natural porous material which is defined as a two-phase material in which the interconnected pore space constitutes one phase and the solid matrix the other. Laboratory samples are tested using fluid flow experiments to determine the relationship of macroscopic properties such as permeability to rock microstructure. Kozeny-Carman and other equations are developed to further quantify these relationships.

21661 (LBL–36909) **Size, shape, and crystallinity of luminescent structures in oxidized Si nanoclusters and H-passivated porous Si.** Schuppler, S. (AT&T Bell Labs., Murray Hill, NJ (United States)); Marcus, M.A.; Xie, Y.H.; Harris, T.D.; Brown, W.L.; Chabal, Y.J.; Szajowski, P.J.; Friedman, S.L.; Adler, D.L.; Ross, F.M. Lawrence Berkeley Lab., CA (United States). Nov 1994. 9p. Sponsored by USDOE, Washington, DC (United States);Alexander von Humboldt-Stiftung, Bonn (Germany). DOE Contract AC03-76SF00098. (CONF-941144–157: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95012322. Source: OSTI; NTIS; GPO Dep.

Near-edge and extended x-ray absorption fine structure measurements from a wide variety of H-passivated porous Si samples and oxidized Si nanocrystals, combined with electron microscopy, ir-absorption, α-recoil, and luminescence emission data, provide a consistent structural picture of the species responsible for the luminescence observed in these systems. For luminescent porous Si samples peaking in the visible region, i. e., $\leq$700nm, their mass-weighted-average structures are determined here to be particles - not wires, whose short-range character is crystalline - not amorphous, and whose dimensions - typically $<$15 Å - are significantly smaller than previously reported or proposed. These results depend only on sample luminescence behavior, not on sample preparation details, and thus have general implications in describing the mechanism responsible for visible luminescence in porous silicon. New results are also presented which demonstrate that the observed luminescence is unrelated to either the photo-oxidized Si species in porous Si or the interfacial suboxide species in the Si nanocrystals.

21662 (LBL–36911) **X-ray absorption spectroscopy from H-passivated porous Si and oxidized Si nanocrystals.** Schuppler, S. (AT and T Bell Labs., Murray Hill, NJ (United States)); Marcus, M.A.; Friedman, S.L. Lawrence Berkeley Lab., CA (United States). Nov 1994. 11p. Sponsored by USDOE, Washington, DC (United States);Alexander von Humboldt-Stiftung, Bonn (Germany). DOE Contract AC03-76SF00098. (CONF-941144–149: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95012352. Source: OSTI; NTIS; GPO Dep.

Quantum confinement in nanoscale Si structures is widely believed to be responsible for the visible luminescence observed from anodically etched porous silicon (por-Si), but little is known about the actual size or shape of these structures. Extended x-ray absorption fine structure data from a wide variety of por-Si samples show significantly reduced average Si coordination numbers due to the sizable contribution of surface-coordinated H. (The IUSI ratios, as large as 1.2, were independently confirmed by ir-absorption and α-recoil measurements.) The Si coordinations imply very large surface/volume ratios, enabling the average Si structures to be identified as crystalline particles (not wires) whose dimensions are typically $<$15 Å. Comparison of the size-dependent peak luminescence energies with those of oxidized Si nanocrystals, whose shapes are known, shows remarkable agreement. Furthermore, near-edge x-ray absorption fine structure measurements of the nanocrystals shows the outer oxide and interfacial suboxide layers to be constant over a wide range of nanocrystal sizes. The combination of these results effectively rules out surface species as being responsible for the observed visible luminescence in por-Si, and strongly supports quantum confinement as the dominant mechanism occurring in Si particles which are substantially smaller than previously reported or proposed.

21663 (LBL–36971) **Investigation of exfoliation joints in Navajo sandstone at the Zion National Park and in granite at the Yosemite National Park by tectonofractographic techniques.** Bahat, D.; Grossenbacher, K.; Karasaki, K. Lawrence Berkeley Lab., CA (United States). Apr 1995. 67p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95012362. Source: OSTI; NTIS; GPO Dep.

Tectonofractographic techniques have been applied to the study of joint exfoliation in the Navajo sandstone at Zion National Park and in the granite at Yosemite National Park. New types of fracture surface morphologies have been observed which enabled the discerning of incipient joints and consequent fracture growth in these rocks. Incipient jointing in the sandstone is mostly manifested by elliptical and circular fractures (meters to tens meters across) initiating from independent origins. They interfere with each other and grow to larger circular fractures producing exfoliation surfaces up to hundreds of meters across. Less frequently, series of large concentric undulations demonstrate the propagation of a large fracture

front producing exfoliation from an individual origin. One such fracture front reveals refraction of undulations at a layer boundary. Certain en echelon fringes surround the joint mirror plane with well defined rims of en echelons and hackles which enable the determination of the tensile fracture stress, σf. Arches in Zion National Park are ubiquitous in shape and size, revealing stages in their evolution by a mechanical process, which was associated with exfoliation, but independent of local faulting. Exfoliation and arching mostly occurred on vertical surfaces of N-NNW and NE sets of prominent joints, but there are also deviations from this general trend. In Yosemite National Park large exfoliations (hundreds of meters in size) developed on the El Capitan cliff by the interaction and merging of many previous smaller incipient joints that vary in size from meters to tens of meter.

21664 (LBL–37086) **Dynamic observation of electrochemical etching in silicon.** Ross, F.M. (Lawrence Berkeley Lab., CA (United States). National Center for Electron Microscopy); Searson, P.C. Lawrence Berkeley Lab., CA (United States). Mar 1995. 4p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract AC03-76SF00098. Grant DMR-9202645. (CONF-9503125–2: 9. international conference on microscopy of semiconducting materials, Oxford (United Kingdom), 20-23 Mar 1995). Order Number DE95012359. Source: OSTI; NTIS; GPO Dep.

The authors have designed and constructed a TEM specimen holder in order to observe the process of pore formation in silicon. The holder incorporates electrical feedthroughs and a sealed reservoir for the electrolyte and accepts lithographically patterned silicon specimens. The authors describe the system and present preliminary, ex situ observations of the etching process.

21665 (NEI-DK–2013) **Polyurethane foam without ozone depleting substances. Experience from Danish industry.** Arbejdsrapport fra Miljoestyrelsen, 62. Pedersen, P.H. (Danish Environmental Protection Agency (Denmark)); Mogensen, L. Miljoestyrelsen, Copenhagen (Denmark). Dec 1994. 80p. Order Number DE95779223. Source: OSTI; NTIS.

Traditionally Danish industry has a high production of polyurethane foam due to the substantial production and export of product like domestic refrigerators and freezers, district heating pipes, joint foam, sandwich insulation panels etc. Experience from Danish industrial projects show that it is possible to produce many kinds of polyurethane foam without ozone depleting substances or substances that contribute to global warming. Two major producers of domestic refrigerators and freezers have changed to cyclopentane blown insulation foam. Four companies, covering more than half of the world production of preinsulated district heating pipes, have developed new pipes where the insulating foam is blown with cyclopentane or similar technology. Sandwich insulating panels blown with water, creating CO_2, can be used with good results. Joint foam has been produced with propane/butane as blowing agent for the Scandinavian market since 1987. Flexible integral foam has been developed, using isopentane as a blowing agent. This development has been encouraged by the Danish phasing-out strategy consisting of three instruments: a tax on CFC and halon, a statutory order gradually banning the use of ODS for specific purposes and a development programme to support non-ODS technology. The developed technologies have been taken into production and shown that in most polyurethane foam production there is no need for substances that deplete the ozone layer or contribute to the global warming. (au)

21666 (NILU-F–18/94) **EUROCARE and classification of environmental aggressivity in Europe.** Haagenrud, S. Norsk Inst. for Luftforskning, Kjeller (Norway). Aug 1994. 27p. (CONF-9406336–1: Vision EUREKA conference on new technology for management and maintenance of Europe's old and new built environment, Hamar (Norway), 13-16 Jun 1994). Order Number DE95779280. Source: OSTI; NTIS.

The publication describes briefly aims and strategies of the EUREKA Umbrella EUROCARE. 17 EUREKA countries and CEC are now participating in the umbrella, which aims at facilitating and promoting market oriented EUREKA projects to counter-act the degradation of Europe's built environment, including the cultural heritage and within a sustainable development context. The strategic goal of these projects is to increase the service life of the built environment and decrease the yearly life cycle costs for its conservation, restoration and maintenance. So far more than 30 EUREKA projects are running. 7 refs., 8 figs.

21667 (ORNL/SUB–87-00184/05) **Gas transport model for chemical vapor infiltration. Topical report.** Starr, T.L. (Georgia Institute of Technology, Atlanta, GA (United States). School of Materials Science and Engineering). Oak Ridge National Lab., TN (United States); Georgia Inst. of Tech., Atlanta, GA (United States). School of Materials Science and Engineering. May 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95012163. Source: OSTI; NTIS; GPO Dep.

A node-bond percolation model is presented for the gas permeability and pore surface area of the coarse porosity in woven fiber structures during densification by chemical vapor infiltration (CVI). Model parameters include the number of nodes per unit volume and their spatial distribution, and the node and bond radii and their variability. These parameters relate directly to structural features of the weave. Some uncertainty exists in the proper partition of the porosity between "node" and'bond" and between intra-tow and inter-tow, although the total is constrained by the known fiber loading in the structure. Applied to cloth layup preforms the model gives good agreement with the limited number of available measurements.

21668 (PNL-SA–25157) **Vacuum deposited polymer films: Past, present, and future applications.** Affinito, J.; Martin, P.; Gross, M.; Bennett, W. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9411174–2: 8. international vacuum web coating conference, Las Vegas, NV (United States), 6-8 Nov 1994). Order Number DE95012397. Source: OSTI; NTIS; GPO Dep.

Two extremely high rate processes have been developed for the vacuum deposition of polymer thin films. Dubbed the PML (for Polymer Multi-Layer) and LML (for Liquid Multi-Layer) processes, the PML technique was originally developed for the manufacture of polymer/aluminum surface mount capacitors while the LML method arose from a need to fabricate lithium polymer batteries. These processes have since been found to be compatible with most other vacuum deposition techniques in, integrated, in-line coating processes. Battelle has developed an extensive program, and a great deal of hardware, to pursue a wide variety of PML and LML applications which integrate these two process technologies with other, conventional, vacuum deposition methods. The historical development of the technologies is reviewed and the Battelle PML/LML facilities are described. Current Battelle work involving solar thermal control films, PML QWOTs, and polymer/metal high reflectors are also discussed. Battelle PML work that is just starting, involving non-linear optical materials/devices, lithium polymer battery fabrication, electrochromic devices, and polymer/oxide multilayers, is discussed as well.

21669 (PNL–SA-25926) **Multilayer coatings on flexible substrates.** Martin, P.M.; Affinito, J.D.; Gross, M.E.; Coronado, C.A.; Bennett, W.D.; Stewart, D.C. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9504155–2: 38. annual technical conference of the Society of Vacuum Coaters, Chicago, IL (United States), 2-7 Apr 1995). Order Number DE95011410. Source: OSTI; NTIS; GPO Dep.

Thin-film optical and non-optical multilayer coatings are deposited onto flexible substrates using a vacuum web coater developed at Pacific Northwest Laboratory. The coater's primary application is rapid prototyping of multilayer (1) polymer coatings, (2) polymer/metal coatings, (3) ceramic/metal coatings, and (4) hybrid polymer, ceramic, and metal coatings. The coater is fully automated and incorporates polymer evaporation and extrusion heads, high-rate magnetron sputtering cathodes, and e-beam evaporation sources. Polymer electrolytes are deposited by extrusion techniques. Flexible plastic, metal, and ceramic substrates can be coated using roll-to-roll or closed-loop configurations. Examples of multilayer optical coatings demonstrated to date are solar reflectors, heat mirrors, Fabry-Perot filters, and alpha particle

sensors. Nonoptical coatings include multilayer magnetic metal/ceramic and lamellar composites.

21670 (SAND–94-3248) **Final report on LDRD Project: Quantum confinement and light emission in silicon nanostructures.** Guilinger, T.R. (and others); Kelly, M.J.; Follstaedt, D.M. Sandia National Labs., Albuquerque, NM (United States). Feb 1995. 68p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95011010. Source: OSTI; NTIS; GPO Dep.

Electrochemically formed porous silicon (PS) was reported in 1991 to exhibit visible photoluminescence. This discovery could lead to the use of integrated silicon-based optoelectronic devices. This LDRD addressed two general goals for optical emission from Si: (1) investigate the mechanisms responsible for light emission, and (2) tailor the microstructure and composition of the Si to obtain photoemission suitable for working devices. PS formation, composition, morphology, and microstructure have been under investigation at Sandia for the past ten years for applications in silicon-on-insulator microelectronics, micromachining, and chemical sensors. The authors used this expertise to form luminescent PS at a variety of wavelengths and have used analytical techniques such as in situ Raman and X-ray reflectivity to investigate the luminescence mechanism and quantify the properties of the porous silicon layer. Further, their experience with ion implantation in Si lead to an investigation into alternate methods of producing Si nanostructures that visibly luminesce.

21671 (SAND–94-8779C) **Recent results in the devleopment of an integrated EUVL laboratory tool.** Tichenor, D.A. (and others); Kubiak, G.D.; Haney, S.J. Sandia National Labs., Livermore, CA (United States). [1994]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950226–48: SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine, San Jose, CA (United States), 5-14 Feb 1995). Order Number DE95010756. Source: OSTI; NTIS; GPO Dep.

The demand for smaller critical dimensions in advanced computer chips has driven projection lithography to shorter wavelengths. Deep ultraviolet systems, operating at 248 nm, are commercially available and 193 nm lithography is under development. This paper describes a research and development program to extend this trend to extreme ultraviolet (EUV) wavelengths, in the range of 11 nm to 14 nm. Research and development activities are concentrated in four major areas: (1) aspheric reflectors required in an advanced EUV camera, (2) surface-imaging resists having the required resolution and sensitivity, (3) defect-free reflecting substrates required for mask fabrication, and (4) a compact source of EUV radiation. Each of these issues is discussed and efforts to address them are described. An intermediate EUVL laboratory tool, currently under construction, will also be described. This system uses a 10 × reduction Schwarzschild camera and a magnetically levitated wafer stage driven by a digital feedback controller. This system represents the first attempt at integrating all major subsystems into an EUVL laboratory tool, suitable for use in device fabrication experiments.

21672 (SAND–95-0848C) **Fundamental surface chemistry of GaAs OMVPE.** Creighton, J.R.; Truong, C.M. Sandia National Labs., Albuquerque, NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9505216–1: US/Japan workshop on atomic scale mechanisms of epitaxial growth, Honolulu, HI (United States), 10-12 May 1995). Order Number DE95011606. Source: OSTI; NTIS; GPO Dep.

Organometallic and hydride compounds are widely used as precursors for the epitaxial growth of GaAs and other compound semiconductors. These precursors are most commonly used to perform organometallic vapor phase epitaxy (OMVPE) and also in related deposition techniques such as atomic layer epitaxy (ALE) and metalorganic molecular beam epitaxy (MOMBE). We have investigated the surface chemical properties of these precursors on GaAs(100) using a variety of surface science diagnostics. Results have shed light on the mechanisms of precursor decomposition which lead to film growth and carbon doping. For instance, kinetics of trimethylgallium (TMGa) decomposition on the Ga-rich and As-rich surfaces, measured by TPD, are in semiquantitative agreement with ALE results; indicating that the dominant growth mechanism during ALE is heterogeneous. Furthermore, there is no compelling evidence for the production of methane (CH_4) on the GaAs surface when TMGa and arsine (AsH_3) are coadsorbed.

21673 (SAND–95-0979C) **Enhancement of surface processes with low energy ions.** Chason, E. Sandia National Labs., Albuquerque, NM (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9505211–2: DOE Council on Materials conference on new directions for ion beams in semiconductor processing, Santa Fe, NM (United States), 4-7 May 1995). Order Number DE95011605. Source: OSTI; NTIS; GPO Dep.

Continuing trends in device fabrication towards smaller feature sizes, lower thermal budgets and advanced device structures put greater emphasis on controlling the surface structure and reactivity during processing. Since the evolution of the semiconductor surface during processing is determined by the interaction of multiple surface processes, understanding how to control and modify these processes on the atomic level would enable us to exert greater control over the resulting morphology and composition. Low energy ions represent one method for bringing controlled amounts of energy to the surface to modify surface structure and kinetics. The kinetic energy deposited by the ions can break bonds and displace atoms, creating defect populations significantly in excess of the equilibrium concentration. Consequences of these non-equilibrium conditions include the enhancement of surface kinetic processes, increased surface reactivity and formation of metastable structures and compositions. These effects can be beneficial (ion enhanced mass transport can lead to surface smoothing) or they can be detrimental (residual defects can degrade electrical properties or lead to amorphization). The net results depend on a complex balance that depends on many parameters including ion mass, energy, flux and temperature. In the following section, we review progress both in our fundamental understanding of the production of low-energy ion-induced defects and in the use of low energy ions to enhance surface morphology, stimulate low temperature growth and obtain non-equilibrium structures and compositions.

21674 (UCRL-JC–118776) **AFM studies of a new type of radiation defect on mica surfaces caused by highly charged ion impact.** Ruehlicke, C. (Lawrence Livermore National Lab., CA (United States)); Briere, M.A.; Schneider, D. Lawrence Livermore National Lab., CA (United States). 28 Sep 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-941129–24: 13. international conference on the application of accelerators in research and industry, Denton, TX (United States), 7-10 Nov 1994). Order Number DE95011536. Source: OSTI; NTIS; INIS; GPO Dep.

Radiation induced defects on mica caused by the impact of slow very highly charged ions (SVHCI) have been investigated with an atomic force microscope (AFM). Freshly cleaved surfaces of different types of muscovite were irradiated with SVHCI extracted from the LLNL electron beam ion trap (EBIT) at velocities of ca. 2 keV/amu. Atomic force microscopy of the surface reveals the formation of blisterlike defects associated with single ion impact. The determined defect volume which appears to increase linearly with the incident charge state and exhibits a threshold incident charge state has been determined using the AFM. These results indicate that target atoms are subjected to mutual electrostatic repulsion due to ionization through potential electron emission upon approach of the ion. If the repulsion leads to permanent atomic displacement, surface defects are formed.

21675 (UCRL-JC–119412) **Extrinsic fracture mechanisms in two laminated metal composites.** Lesuer, D.; Syn, C.; Riddle, R.; Sherby, O. Lawrence Livermore National Lab., CA (United States). 29 Nov 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950201–16: Annual meeting and exhibition of the Minerals, Metals and Materials Society (TMS), Las Vegas, NV (United States), 12-16 Feb 1995). Order Number DE95011737. Source: OSTI; NTIS; GPO Dep.

The crack growth behavior and fracture toughness of two laminated metal composites (6090/SiC/25p laminated with 5182 and ultrahigh-carbon steel laminated with brass) have been studied in

both "crack arrester" and "crack divider" orientations. The mechanisms of crack growth were analyzed and extrinsic toughening mechanisms were found to contribute significantly to the toughness. The influence of laminate architecture (layer thickness and component volume function), component material properties and residual stress on these mechanisms and the resulting crack growth resistance are discussed.

21676 (VTT-PUB–221) **Allowable stresses in FRP marine vessels.** Visuri, M. (VTT Manufacturing Technology, Espoo (Finland). Marine and Mechanical Engineering). Technical Research Centre of Finland, Espoo (Finland). 1995. 117p. Order Number DE95779236. Source: OSTI; NTIS.

The publication consists of a literature survey of allowable stresses used in fibre-reinforced plastic (FRP) structures, and a new method for the determination of allowable stresses is presented. In the literature survey, primary attention has been paid to the marine industry (including classification societies), the aerospace industry, and to pressure vessel and pipe standards. Generally the subject is only briefly discussed in the literature. This is a drawback, since the conservatism dominating the rules used today often means unnecessary weight penalties. High factors of safety (FoS), except in the aerospace industry, are used in most designs. The short experience of structures in service, wide variety of material combinations and the rather complicated mechanical behaviour are the most important factors in this regard. The presented determination method for allowable stresses aims at introducing a more rational way for dimensioning. The method is based on the partial factors of safety concept. A statistical analysis can be included for better accuracy. This requires enough data of material and load behaviour. The method is flexible and can be tailored to various needs. One major drawback is the lack of information concerning material behaviour under long-term loads. The method is aimed to be expanded in the future. (orig.)

Ambers are well known and abundant in terrestrial sediments all over the world; however, due largely to the absence of definite morphological characteristics, the precise botanical origin of most amber samples, are at best, often a matter of speculation. This has severely restricted the usefulness of amber in paleobotanical and paleoecological interpretations. The molecular composition and structural characteristics of fossil resins however, may preserve evidence of their botanical origin, which could be of great value in both geochemical, paleobotanical, and paleoenvironmental studies. The remains of a number of exceptionally well-preserved Taxodiaceae-dominated swamp-forest communities have been identified in the sediments of the middle Eocene (45 million years old) Buchanan Lake Formation of Axel Heiberg Island, Canadian Arctic Archipelago. The amber collected from these ancient in situ forests provides a unique opportunity to characterize these resins chemically and taxonomically. Resinite associated with Metasequoia, Pinus and Pseudolarix has been characterized using Pyrolysis-Gas Chromatography-Mass Spectrometry. This method provides a direct analysis of the molecular structure and composition of the resin. In several cases, both bled resin and cone-resin samples have been characterized. The results of these analyses are presented and discussed. The implications of these results for the botanical origins of other ambers represented in the fossil record (including succinite) will also be discussed.

21678 (ANL/FE/CP–83609) **Analysis of metallic fuels by laser ablation.** Johnson, S.G. (Argonne National Lab., Idaho Falls, ID (United States)); Goodall, P.S.; Wood, E.L.; Kimbrell, S.M. Argonne National Lab., Idaho Falls, ID (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950226–50: SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine, San Jose, CA (United States), 5-14 Feb 1995). Order Number DE95012465. Source: OSTI; NTIS; GPO Dep.

A hot cell-based solid sampling system has been developed for application to the analyses of irradiated materials such as metallic reactor fuel from a nuclear reactor, and radioactive waste forms. This system employs one of two sampling techniques, glow discharge or laser ablation, for introduction of material into one of two instruments for analysis, either a time of flight mass spectrometer or an inductively coupled argon plasma-atomic emission spectrometer (ICP-AES). This paper will discuss using ICP-AES for the analysis of major, minor and trace constituents in an unirradiated U-10 wt % Zr metallic reactor fuel. The behavior of highly refractory elements, such as Zr, in the laser ablation process will be examined in detail. Additional corroborative data provided via scanning electron microscopy-energy dispersive x-ray fluorescence spectroscopy (SEM-EDS) will be presented.

21679 (CONF-950865–1) **The self-supporting disc: A specimen geometry exhibiting low secondary characteristic fluorescence.** Anderson, I.M. (Oak Ridge National Lab., TN (United States). Metals and Ceramics Div.); Bentley, J.; Carter, C.B. Oak Ridge National Lab., TN (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States);Oak Ridge Inst. for Science and Education, TN (United States). DOE Contract AC05-76OR00033 ; AC05-84OR21400. Grant DMR-8901218. From 29. annual meeting of the Microbeam Analysis Society; Breckenridge, CO (United States); 6-11 Aug 1995. Order Number DE95012849. Source: OSTI; NTIS; GPO Dep.

Secondary characteristic fluorescence, when expressed relative to the primary intensity of the fluorescing element, can be written as the product of three factors, which represent the probabilities of the various processes that govern the magnitude of fluorescence and thus have values between zero and one. Two of these factors are characteristic of the material being analyzed. The factor $C_X{}^Y$ is the likelihood that the primary x ray of Y is absorbed by the element X if it is absorbed in the fluoresced volume of the specimen. The factor P_X is the probability that element X, having absorbed the primary x ray, emits the secondary x ray of interest. The third factor is the likelihood that the primary x ray is absorbed in the fluoresced volume, and is denoted $\Omega_{eff}/4\pi$. For critical microanalysis studies, thin-flake specimens are most desirable, especially if the size of individual flakes is small relative to the scale, ~10 μm, over which the primary x rays are typically absorbed. However, a specimen comprised of small flakes may be impractical for many studies. Such a geometry may not indicate the relative positions and orientations of important microstructural features. The lack of sampling volume may also inhibit microanalysis of a specific feature of the microstructure, such as an interface, which may not be represented within the small specimen volume. For such analyses, a specimen geometry that leaves the specimen intact, yet minimizes secondary fluorescence by virtue of having a small geometric factor, may be preferable. Because the geometric factor depends only on the absorption properties of the secondary x ray, a rule-of-thumb maximum secondary fluorescence of an elemental line can be calculated by assuming an extreme microanalysis situation: when the entire disc is composed of the fluoresced element.

21681 (DOE/ER/13770–T3) **Distributed measurements of tracer response on packed bed flows using a fiberoptic probe array. Final report.** Jones, M.C. (National Inst. of Standards and Technology, Boulder, CO (United States). Chemical Science and Technology Lab.); Nassimbene, R.; Wolfe, J.; Frederick, N. National Inst. of Standards and Technology, Boulder, CO (United States). Chemical Sciences and Technology Lab. 28 Oct 1994. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI05-87ER13770. Order Number DE95013079. Source: OSTI; NTIS; GPO Dep.

Scale-up of packed bed processes, particularly those involving chromatographic separations, is made difficult by a seemingly inevitable increase in dispersion due to packing nonuniformity. To provide a suitable characterization, the authors measured the spatial distribution of dispersion and mixing in packed beds of uniform impervious spherical glass particles by a tracer impulse technique. The key feature in this work is the use of a fiberoptic array at the exit plane to obtain a time-resolved spatially distributed response. All experiments were in the creeping flow regime. The authors used a fluorescent dye with laser excitation through the fiber terminations in the bed. The fluoresced radiation was collected through the same fibers. They analyzed the data by the use of indices of the extent of micromixing based on Danckwerts's original degree of segregation and an additional index of structural uniformity. The computations involve a moment analysis of the individual and average probe responses. A simple model gives expressions for the indices in terms of the Peclet number and is shown to provide a useful limiting case. The computed indices are also shown to be very sensitive to adsorption of dye on the surface of the glass. However, for some of the experiments with the largest spheres using Pyrex glass, the effects of adsorption are indiscernible. This technique successfully separates the contribution of micromixed fluid to overall bed dispersion from the contribution due to the transverse variation of the flow residence time.

21682 (DOE/MC/27115–95/C0478) **Zeolite membranes for gas separations.** Falconer, J.; Noble, R. Colorado Univ., Boulder, CO (United States). Dept. of Chemical Engineering. [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG21-90MC27115. (CONF-950494–20: Natural gas research, development and demonstration contractors review meeting, Baton Rouge, LA (United States), 4-6 Apr 1995). Order Number DE95012984. Source: OSTI; NTIS; GPO Dep.

Silicalite-1, a pure silica zeolite, was deposited on a tubular, asymmetric, γ-alumina support. Single gas permeation experiments with N_2, CH_4, and CO_2 were carried out on the membrane. Separation experiments for N_2/CH_4 mixtures were also conducted. Single-gas permeation of H_2 and separation of H_2/SF_6 mixture were also carried out with the membrane. Composite membranes of silicalite and Ni-SAPO-34 were also fabricated, but no CO_2/H_2 selectivity was found. It is proposed to use these membranes for methanol synthesis and separation, and for separating H_2 from gasification products for use as fuel cell fuel, etc.

21683 (FZKA–5514) **Synthesis, characterization and optimization of siloxane polymer coatings for optical sensors based on absorption measurements in the evanescent field.** Zimmermann, B. Forschungszentrum Karlsruhe GmbH Technik und Umwelt (Germany). Inst. fuer Radiochemie; Karlsruhe Univ. (T.H.) (Germany). Fakultaet fuer Chemie. Feb 1995. 152p. (In German). Order Number DE95779674. Source: OSTI; NTIS (US Sales Only).

In this work polysiloxanes with methyl and phenyl side chains were synthesized. The properties of this membranes had to be optimized for the application in optical sensors for monitoring nonpolar organic compounds in aqueous media. The sensing principle is based on the enrichment of these substances in the hydrophobic polysiloxane membrane and the measurement of their evanescent wave near-infrared (NIR) absorption spectra by means of a light conducting element, which is in contact with the membrane. For the preparation of the silicone membranes chainlike α, ω-dioles were synthesized by hydrolysis of dichlorodimethylsilane. This viscous and liquid dioles were cured to solid polymers by a condensation reaction. The synthesis of poly(dimethyl-co-methylphenylsiloxanes) with varying degrees of phenylation was carried out by reverse hydrolysis of dichlorodimethylsilane and dichloromethylphenylsilane. In this way it was possible to adjust the refractive index of the polymers which is dependent on the degree of phenylation. The degree of phenylation again can be easily varied through the stoichiometric portion of $(CH_3)(C_6H_5)SiCl_2$ in the starting mixture of the reactants. The siloxane as well as the enriched compounds show absorption bands in the same region of the NIR range. This leads to interferences in the spectral detection of the analyte. To avoid these interferences deuterated siloxane polymers were synthesized by reaction of $(CD_3)_2SiCl_2$ with methanol/acetic acid and curing of the diols by a condensation reaction. The characterization of the synthesized siloxane polymers was done by IR- and NIR-spectroscopy. Moreover, the ability of the siloxanes to enrich nonpolar organic substances out of aqueous solutions was examined. An improvement was achieved by insertion of phenyl side chains in the polysiloxane backbone. (Abstract Truncated)

21684 (INIS-JP–028, pp. 118-120) **Characterization of single crystalline semiconductors by RBS measurements.** Matsunami, Hiroyuki (Kyoto Univ. (Japan). Faculty of Engineering); Yoshimoto, Masahiro; Kimoto, Tsunenobu; Komatsu, Yuji; Itoh, Akira. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University.* Order Number DE95709897. Source: OSTI; NTIS; INIS.

Single crystalline SiC, GaP and InGaP were characterized by RBS (Rutherford Backscattering Spectroscopy) measurements. The surface damage introduced through polishing processes was analyzed in detail. The damaged layers could be removed by surface treatments such as reactive ion etching and thermal oxidation. The residual impurities in sublimation-grown SiC could be reduced significantly by using pure SiC sources. Crystallinity of GaP heteroepitaxially grown on Si was also examined by the channeling measurements. (author).

21685 (INIS-JP–028, pp. 121-122) **An investigation on the structure of semiconductor hetero interface by RBS and SR SAXS.** Okuda, Hiroshi (Kyoto Univ. (Japan). Faculty of Engineering); Vezin, V.; Osamura, Kozo. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University.* Order Number DE95709897. Source: OSTI; NTIS; INIS.

The structure of GaAs/Si and Ge/Si lattice-mismatched heterostructure has been investigated by synchrotron-radiation small-angle scattering(SR-SAXS) and RBS experiment. The small-angle scattering intensity profile obtained by using two-dimensional detector (imaging plate) has been interpreted in terms of the imperfect interface and lattice defect in the epitaxial layer. RBS experiments with 2MeV He^{2+} have been carried out to check the film thickness and the composition profile of the epitaxial layers. (author).

21686 (INIS-JP–028, pp. 133-135) **Elemental analyses of bulk and individual particles by PIXE and SEM-EDX.** Kasahara, Mikio (Kyoto Univ., Uji (Japan). Inst. of Atomic Energy); Shinoda, Kazuyuki; Takahashi, Kanji; Yoshida, Kouji. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University.* Order Number DE95709897. Source: OSTI; NTIS; INIS.

The atmospheric aerosol samples were collected by a stacked filter method under the various environmental conditions. The elemental concentrations of aerosol particles were measured using PIXE analysis as a bulk sample. And also elemental compositions of about 200 individual particles per each sample were measured by SEM-EDX analysis. In this study, the correspondencies of analytical results measured by both analyses as well as chemical characteristics of individual and bulk aerosols were investigated. (author).

21687 (INIS-JP–028, pp. 136-137) **Determination of trace elements in woods.** Katayama, Yukio (Kyoto Univ. (Japan). Faculty of Agriculture); Anzai, Takao; Nishimura, Kazuo; Yomita, Michio. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). The particle induced X-ray emission(PIXE) method was applied to the analysis of the elements in tree rings of sugi(Cryptomeria japonica D.Don). The wood samples were collected from near the arsenic mine(Miyazaki prefecture), the copper mine and the antimony refinary(Shiga prefecture). Arsenic is hardly detectable in sugi grown up at the normal condition. However, in this case it was detected corresponding virtually to the period when the refinary had been in operation. (author).

21688 (INIS-JP–028, pp. 138-141) **Neuropathological changes of rabbit spinal motor neurons induced by retrograde axonal aluminum-uptake.** Yoshida, Sohei (Wakayama Medical Coll. (Japan)); Kihira, Tameko; Koumoto, Junko; Wakayama, Ikuro; Ishiguchi, Hiroshi; Nakagawa, Mari; Yase, Yoshiro; Sasajima, Kazuhisa; Yoshida, Kouichi. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University.* Order Number DE95709897. Source: OSTI; NTIS; INIS.

To examine pathological changes of spinal motor neurons induced by subepineurial injection of 10-500 μ1 of 2% $AlCl_3$ solution into a sciatic nerve of rabbits, histometric studies of chromatolytic neurons, spheroids/globules and degenerative neurons in the both lumbar anterior gray horn tissues was undertaken using routine and immunochemical staining methods. All these neuronal changes were reactive to the antineurofilament antibody (SM1). Except chromatolytic neurons, the appearance of spheroids/globules and degenerative neurons were significantly dose-responsive to the volume of injected 2% $AlCl_3$ solution. In this acute experiments, it is suggested that Al may primarily cause a disturbance of neurofilament transport in proximal axons, consequently leading to neurofibrillary degeneration of neurons. (author).

21689 (INIS-JP–029, pp. 138-139) **Qualitative and quantitative analyses of many metals by PIXE method.** Tazawa, Yuji (Kyoto Univ. (Japan). Dept. of Physics); Ogino, Koya; Tanimoto, Masao. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

PIXE(Particle induced X-ray Emission) Method was applied to both qualitative and quantitative analyses of many metals in sample. In this experiments, several samples have been tested for the next studies:(a)Abundances of trace elements in micro-particles collected from Antarctic ice and snow. (b)Abundances of trace elements such as Sulfur(S) and Chlorine(Cl) emitted from explosive volcanic eruption in tree-rings. (c)Decrease of S-metal sandwiched between thin Au foils. (author).

21690 (INIS-JP–029, pp. 147-149) **Evaluation of biological materials with PIXE analysis and RBS.** Tsuboi, Yoichi (Kyoto Univ. (Japan). Faculty of Medicine); Yokoe, Yoshihiko; Iizuka, Tadahiko. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

PIXE and RBS were applied to determine the composition of the surface TiO_2 layer of titanium implant and TiO_2 thin film prepared by Ion Beam Irradiation. The PIXE analysis of the oxide films determined, with high precision, the incorporation of impurities and the variation of the ratio of the constituent elements. The results of the present investigation showed that the PIXE analysis combined with RBS, can be effectively used for qualitative and quantitative analysis of thin film on the surface and in the film-substrate interface of titanium implant. (author).

21691 (INIS-JP–029, pp. 150-151) **Trace element analysis of soy sauce.** Tomita, Michio (Kyoto Prefectural Univ. (Japan)); Haruyama, Yoichi; Saito, Manabu. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

Trace elements in soy sauce have been measured by means of in-air PIXE. Six kinds of trace elements were detected, such as Mu, Fe, Ni, Zn, Cu and Br. Concentrations of Mn, Fe, Zn and Br which were observed in all samples, have been determined. Each analyzed sample contained considerable amount of bromine about 160 ppm. (author).

21692 (INP–1648/CA) **Instrumental methods for analysis of some elements in flour.** Zagrodzki, P. For ten various brands of flour contents of chosen (heavy) elements were determined by means of ICP, GF-AAS, PIXE and ASV/CSV methods. General performance of participating laboratories as well as pros and cons of different analytical methods were compared and discussed. (author). 6 refs, 6 figs, 7 tabs.

21693 (LA-SUB–94-37) **Ultraviolet-visible-near infrared spectra of 50 samples.** Taylor, B. (Crane Unidynamics Phoenix, AZ (United States)). Los Alamos National Lab., NM (United States); Crane Unidynamics Phoenix, AZ (United States). 30 Aug 1988. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95011062. Source: OSTI; NTIS; GPO Dep.

Under the subject contract, Unidynamics/Phoenix recorded the ultraviolet-visible-near infrared spectra of 50 samples supplied by LANL. A Varian Cary 2300 series spectrophotometer produced the spectral data. The spectrophotometer was interfaced to a Varian D5-15 Data Station, and hard copies of data were made. Baseline corrections throughout the wavelength range were established using Halon as a reference material. Corrected measurements were automatically made by the system on every sample. Two types of sample holders were tried. Before collecting data on the LANL samples, identical samples of PETN were examined using both holders.

21694 (NREL/CP–433-7748) **Applications of free-jet, molecular beam, mass spectrometric sampling: Proceedings.** Milne, T. (ed.). National Renewable Energy Lab., Golden, CO (United States). Mar 1995. 305p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. (CONF-9410343–: Applications of free-jet, molecular beam, mass spectrometric sampling conference, Estes Park, CO (United States), 11-14 Oct 1994). Order Number DE95004052. Source: OSTI; NTIS; GPO Dep.

Over the past 35 years, the study of die behavior and uses of free-jet expansions for laboratory experiments has greatly expanded and matured. Not the least of these uses of free-jet expansions, is that of extractive sampling from high temperature, reactive systems. The conversion of the free-jet expanded gases to molecular flow for direct introduction into the ion source of a mass spectrometer offers several advantages, to be illustrated in these pages. Two meetings on this subject were held in 1965 and 1972 in Missouri, sponsored by the Office of Naval Research and Midwest Research Institute. At these meetings rarefied gas dynamicists came together with scientists using free-jet sampling for analytical purposes. After much too long a time, this workshop was convened to bring together modern practitioners of FJMBS (Free-jet, Molecular-beam, mass spectrometry) and long time students of the free-jet process itself, to assess the current state of the art and to forge a community that can foster the development of this novel analytical approach. This proceedings is comprised of 38 individually submitted papers. Individual papers are indexed separately on the Energy Data Base.

21695 (SAND–94-3162C) **The detection of mixtures of NO_x's with hydrogen using catalytic metal films on the Sandia Robust Sensor with pattern recognition.** Hughes, R.C.; Osbourn, G.C.; Bartholomew, J.W.; Rodriguez, J.L. Sandia National Labs., Albuquerque, NM (United States). [1994]. 4p. Sponsored by

USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950650–4: 8. international conference on solid-state sensors and actuators and 9th biannual international conference and annual European conference on solid-state sensors, Stockholm (Sweden), 25-29 Jun 1995). Order Number DE95013865. Source: OSTI; NTIS; GPO Dep.

Microsensors often do not have the selectivity to chemical species available in large laboratory instruments. A new type of pattern recognition algorithm is used to classify mixtures of H_2 with NO_2 and O_2. The microsensors used are thin film catalytic metal field effect transistors and chemiresistors on the Sandia Robust Sensor platform. For this study pure Pd thin films and Pd/Ni alloys are shown to provide good classification of mixtures containing NO_2 from those containing O_2 or no oxidant.

21696 (UCRL-ID–119315) **A preliminary study of extraction solvents for CW-agents and their decomposition products [3:1 (methylene chloride:isopropanol) vs. methylene chloride].** Alcaraz, A.; Ward, R.L.; Hulsey, S.S.; Andresen, B.D. Lawrence Livermore National Lab., CA (United States). 15 Sep 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95012108. Source: OSTI; NTIS; GPO Dep.

The major focus of this study was to explore the possibility of using different extraction solvents (or solvent combinations) to isolate CW agents and their degradation products from environmental and industrial samples. The general approach for extracting, e.g. water samples, required the use of a 3:1 (methylene chloride:isopropanol) extraction solvent. Although the 3:1 solvent extraction work-up methods provided excellent results in several Inter-laboratory Comparison Tests, the implementation of these methods for CW on-site analysis exercises was difficult (the methods require cumbersome equipment and are labor intensive). However, due to the time, power, and size restraints set forth by the Chemical Warfare Convention (CWC) for a CW on-site inspection, LLNL developed new sample work-up methods. The approach selected by LLNL incorporated solid phase extraction (SPE) techniques. It is evident from this preliminary study that new or previously used extraction solvents should be re-investigated. It was determined that care must be taken in handling the samples prior to NMR measurements. Also, it was determined that the four target compounds used in this study were extracted on average 18% higher with 3:1 (CH_2Cl_2:IPA) vs. CH_2Cl_2. However, additional target compounds need to be investigated using this extraction solvent to determine which classes of compounds are better extracted by the use of a 3:1 solvent system. This preliminary study clearly reveals that a mixed solvent system can yield better extraction efficiencies for mixture of compounds in aqueous samples.

21697 (UCRL-ID–120019) **Research on computed tomography reconstructions from one or two radiographs: A report and the application to FXR radiography.** Back, N.; Schneberk, D.; McMillan, C.; Azevedo, S.; Gorvad, M. Lawrence Livermore National Lab., CA (United States). 26 Jan 1995. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95013292. Source: OSTI; NTIS; GPO Dep.

This report documents some cooperative research into volumetric image reconstruction from single radiographs. Imaging dynamic events is the most important application for this type of work, but the techniques have possible extensions. Two general objectives guide this work. The first objective is to gain an understanding of the assumptions and limitations of single-view methods for representing internal features. Second, we endeavor to obtain and/or develop techniques for performing image reconstructions with FXR radiographs. If possible, we seek to obtain some quantitative measure of the accuracy of this class of image reconstructions in two respects: (i) in terms of the dimensional accuracy of feature boundaries, and (ii) as pertains to the accuracy of the voxel intensities. Dynamic events are not always self-calibrating, and it is important to establish the reconstruction accuracy of single-view methods for placing bounds on the kinds of conclusions which can be advanced from single-view reconstructed images. Computed tomographic image reconstructions provide dimensional detail of internal structures of objects and provide a measure of the per-voxel attenuation of material in the object. When assumptions behind a reconstruction algorithm are not satisfied, or are satisfied in a limited way, the accuracy of the reconstructed image is compromised. It is the goal of Cr analysis to discern the "real" features of the internals of an object in the midst of a certain level of artifactual content in the image. By understanding the ways in which CT reconstructions from a single radiograph can produce misleading results we hope to develop some measure of the benefits and limitations of single view techniques. 31 refs., 20 figs.

21698 (ANL/CHM/CP–83703) **Theoretical dynamical studies of metal clusters and cluster-ligand systems.** Jellinek, J. Argonne National Lab., IL (United States). [1995]. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9409347–1: NATO Advanced Study Institute on metal-ligand interactions: structure and reactivity, Cetraro (Italy), 4-16 Sep 1994). Order Number DE95012461. Source: OSTI; NTIS; GPO Dep.

In what follows we use the term cluster to designate a cohesive group of like atoms (molecules), i.e., bare ("neet" "naked") clusters. More generally, the term is also used for organo- and inorganometallic compounds, i.e., ligated clusters. Although the approaches and techniques used by the various disciplines to study metal-ligand interactions are quite different, many of the central subjects and issues are common for them. The common subjects include possible geometric structures and isomeric forms, structural (isomerization) transitions, stability, fluxionality, structure-reactivity correlation (or lack of it), role of coordination, etc. However, the precise interpretation of these issues and the details emphasized by the different disciplines are dictated by the nature of the objects studied and may not, therefore, be identical. For example, questions regarding structures, isomerization transitions, fluxionality or even melting of metal clusters refer to the state and properties of the metal network itself. The same questions, when asked in connection with organo- and inorganometallic compounds, often refer to the arrangements and rearrangements of the ligands attached to a metal framework of a fixed structure. Of course, when required, the state of and changes in the metal framework are considered as well. The fields of metal-containing molecular compounds, surface science, and physics and chemistry of clusters furnish complementary information on a broad variety of metal-ligand systems. A comprehensive understanding of the nature and properties of these systems, as defined by the type and number of metal atoms and ligands involved, can be achieved only through a mutual awareness of and continuing progress in all of these research areas.

21699 (ANL/CMT/CP–85232) **Computational studies of Bronsted acid sites in zeolites.** Curtiss, L.A. (Argonne National Lab., IL (United States)); Iton, L.E.; Zygmunt, S.A. Argonne National Lab., IL (United States). Jan 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950439–14: SMS simulation multiconference: simulation as a critical technology, Phoenix, AZ (United States), 9-13 Apr 1995). Order Number DE95013391. Source: OSTI; NTIS; GPO Dep.

The authors have performed high-level ab initio calculations using both Hartree-Fock (HF) and Moller-Plesset perturbation theory (MP2) to study the geometry and energetics of the adsorption complex involving H_2O and the Bronsted acid site in the zeolite H-ZSM-5. In these calculations, which use aluminosilicate cluster models for the zeolite framework with as many a 28 T atoms (T = Si, Al), we included geometry optimization in the local vicinity of the acid site at the HF/6-31G(d) level of theory, and have calculated corrections for zero-point energies, extensions for zero-point energies, extensions to higher basis sets, and the influence of electron correlation. Results for the adsorption energy and geometry of this complex are reported and compared with previous theoretical and experimental values.

21700 (DOE/BC/14882–10) **Responsive copolymers for enhanced petroleum recovery. Second annual report.** McCormick, C.; Hester, R. University of Southern Mississippi, Hattiesburg, MS (United States). Dept. of Polymer Science. May 1995. 200p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92BC14882. Order Number DE95000143. Source: OSTI; NTIS; GPO Dep.

The authors describe second year efforts in synthesis, characterization, and rheology to develop polymers with significantly improved efficiency in mobility control and conformance. These advanced polymer systems would maintain high viscosities or behave as virtual gels under low shear conditions and at elevated electrolyte concentrations. At high fluid shear rates, associates would deaggregate yielding low viscosity solutions, reducing problems of shear degradation or face plugging during injection. Polymeric surfactants were also developed with potential for use in higher salt, higher temperature reservoirs for mobilization of entrapped oil. Chapters include: Ampholytic terpolymers of acrylamide with sodium 3-acrylamido-3-methylbutanoate and 2-acrylamido-2-methylpropanetrimethylammonium chloride; Hydrophilic sulfobetaine copolymers of acrylamide and 3-(2-acrylamido-methylpropane-dimethylammonio)-1-propanesulfonate; Copolymerization of maleic anhydride and N-vinylformamide; Reactivity ratio of N-vinylformamide with acrylamide, sodium acrylate, and n-butyl acrylate; Effect of the distribution of the hydrophobic cationic monomer dimethyldodecyl(2-acrylamidoethyl)ammonium bromide on the solution behavior of associating acrylamide copolymers; Effect of surfactants on the solution properties of amphipathic copolymers of acrylamide and N,N-dimethyl-N-dodecyl-N-(2-acrylamidoethyl)ammonium bromide; Associative interactions and photophysical behavior of amphiphilic terpolymers prepared by modification of maleic anhydride/ethyl vinyl ether copolymers; Copolymer compositions of high-molecular-weight functional acrylamido water-soluble polymers using direct-polarization magic-angle spinning ^{13}C NMR; Use of factorial experimental design in static and dynamic light scattering characterization of water soluble polymers; and Porous medium elongational rheometer studies of NaAMB/AM copolymer solutions.

21701 (DOE/ER/13183–10) **Thermodynamic and kinetic aspects of surface acidity. Progress report, July 1, 1994–June 30, 1995.** Dumesic, J.A. Wisconsin Univ., Madison, WI (United States). Dept. of Chemical Engineering. [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-84ER13183. Order Number DE95012902. Source: OSTI; NTIS; GPO Dep.

Catalytic cracking of isobutane and 2-methyl-hexane over various USY-zeolite catalysts was studied. A kinetic model was developed for isobutane cracking over calcined and steamed Y-zeolite catalysts. Catalyst steaming leads to decreased Bronsted acidity. The studies of catalyst acid and basic properties were broadened to include alumina-supported metal oxides and a sulfated zirconia catalyst (isomerization of normal butane).

21702 (DOE/ER/13460–1) **Energies of organic compounds.** Wiberg, K.B. Yale Univ., New Haven, CT (United States). Dept. of Chemistry. [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER13460. Order Number DE95014701. Source: OSTI; NTIS; GPO Dep.

The studies included hydrolysis of ketals, hydration of alkenes, barrier to rotation about C-O bonds in esters and acids, hydrolysis of lactones, reduction of ketones, non-bonded interactions, and enthalpies of vaporization of ketones, ketals, and other compounds.

21703 (DOE/ER/13460–3) **[Energies of organic compounds].** Yale Univ., New Haven, CT (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER13460. Order Number DE95014703. Source: OSTI; NTIS; GPO Dep.

The first part of our study of the enthalpy of reduction of carbonyl compounds has been completed and includes four aldehydes, acetone, a series of cyclic ketones and ethyl acetate. Results suggest that some of the literature data for these compounds are significantly in error. Equilibrium constants have been measured for the reaction of carbonyl compounds with water to give hydrates as well as with methanol to give either hemiacetals or acetals. They cover a wide range, and studies are underway to determine the reasons for the differences. Studies of the enthalpies of hydration of some alkenes which yield tertiary alcohols have been completed, as well as a study of the hydrolysis of lactones. The "gauche effect" has been studied, and has been shown to result from the formation of bent bonds when atoms of much different electronegativity are joined.

21704 (DOE/ER/13460–6) **[Energies of organic compounds].** Wiberg, K.B. Yale Univ., New Haven, CT (United States). [1991]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER13460. Order Number DE95014704. Source: OSTI; NTIS; GPO Dep.

The enthalpy of reduction of lactones to the corresponding diols has been determined, allowing the enthalpies of formation of the lactones to be determined. Results of this study agree well with data obtained for enthalpies of hydrolysis of the lactones. We have begun the measurement of the enthalpies of reduction of norbornanones, and we have shown that it is possible to determine the difference in energy between the exo and endo forms of the product alcohols by measuring the equilibrium constant as a function of temperature. The study of the enthalpies of hydration of carbonyl compounds has continued, and the enthalpies of hydrolysis of the corresponding ketals is being determined. The study of the enthalpies of hydration of alkenes is nearly completed, and the rearrangement reactions which were uncovered are being investigated.

21705 (DOE/PC/91030–T13) **Methyl chloride via oxyhydrochlorination of methane. Quarterly technical progress report No. 13, October–December 1994.** Dow Corning Corp., Carrollton, KY (United States). Feb 1995. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91030. Order Number DE95014334. Source: OSTI; NTIS; GPO Dep.

The purpose of this contract is to develop a process for converting light alkane gases to methyl chloride via oxyhydrochlorination using highly selective, stable catalysts in fixed-bed reactors designed to remove the large amount of heat generated, so as to control the reaction temperature. Further, the objective is to obtain the engineering data base necessary for developing a commercially feasible process and to evaluate t economics of the process. Significant progress was made in six different technical areas during this quarter. These key highlights are: (1) Evaluation of catalyst samples from UCI led to the ordering of the OHC PDU catalyst batch. This catalyst batch arrived, was screened and found to be defective, and was reordered. (2) Natural gas containing higher hydrocarbons was used as a methane source. The reactant mixture formed oxygenates at temperatures lower than observed in the past. Burning at such low temperatures seems to create a product stream containing very little CH_2Cl_2. (3) Although it has not been decided if the PDU will use natural gas from the plant or methane or natural gas from cylinders as a methane feed source, it was concluded that an adsorption unit to remove sulfur and higher hydrocarbons is not necessary at this time. (4) PDU construction was completed in December. The bulk of insulation work was completed at the end of November. Much effort has been put into pressure testing the PDU's systems. The startup team has become adept at finding and correcting such leaks. (5) SOP writing for the PDU was completed this quarter with communication with the software programmer to insure agreement between the software and SOP.

21706 (DOE/PC/91030–T14) **Methyl chloride via oxyhydrochlorination of methane. Quarterly technical progress report No. 9, October 1993–December 1993.** Dow Corning Corp., Carrollton, KY (United States). Feb 1994. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91030. Order Number DE95014333. Source: OSTI; NTIS; GPO Dep.

The purpose of this contract is to develop a process for converting light alkane gases to methyl chloride via oxyhydrochlorination using highly selective, stable catalysts in fixed-bed reactors designed to remove the large amount of heat generated, so as to control the reaction temperature. Further, the objective is to obtain the engineering data base necessary for developing a commercially feasible process and to evaluate the economics of the process. The key technical progress this quarter was the great deal of progress in equipment design, instrument selection and

data sheet preparation for the PDU. This work is outlined under the Task 2.0 and 3.0 sections below. Catalyst definition this quarter provided limited progress due to the attempt to start up a new screening reactor than ran at higher pressures. The use of high pressure without the availability of a HCl removal unit operation resulted in many experimental problems. This will be solved by the use of the separation unit operation lab equipment as a catalyst screening reactor in the future. Work continued on the development of the separation system. Results showed that at a given pressure and L/G , as the amount of methyl chloride in the feed gas increases, the removal efficiency also increases. Variation of column parameters showed that the "absorber" acts not only as an absorber, but also as a direct contact condenser. This will provide significant benefit to the PDU.

21707 (ETDE-DE–123) **Electrochemical investigation of the inclusion/removal of oxygen in/from tin dioxide at high temperatures.** Kaczorowski, H.; Pohl, J.P. Dortmund Univ. (Germany). Lehrstuhl fuer Physikalische Chemie 1. [1993]. 11p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 0328736A. Order Number DE95780302. Source: OSTI; NTIS (US Sales Only).

This work is a report on investigations on the dependence of nonstochiometry of tin dioxide, ie the deviation from the tin/oxygen ratio of 1:2 as a function of the chemical potential $\mu_0(SnO_2)$ of oxygen in SnO_2. The μ_0 (SnO_2) in the tin dioxide measurement electrode was determined of potentio-statically fixed via the EMF of the solid chain with the build-up Cu, Cu_2O vertical stroke $ZrO_2(Y_2O_3)$ vertical stroke SnO_2 vertical stroke Au. During current flow through the chain, oxygen is included in /removed from the oxide in the firm of oxygen ions and electrons. With the aid of measured results on the electron concentration of SnO_2, socalled 'electrochemical titration' of tin oxide was obtained from these measurements at various temperatures, in which the relationship between (absolute) nonstochiometry and partial oxygen pressure was reproduced. By evaluation of the kinetics of the above-mentioned inclusion/removal process, the chemical diffusion coefficient of oxygen in tin dioxide was able to be determined. (MM)

21708 (JINR–94-1, pp. 22-23) **Experimental studies for production of some medically important radionuclides: ruthenium-97, tungsten-178, actinium-225.** Khalkin, V.A. 21709 (KAPL–4790) **Solubility behavior of quartz and corundum in supercritical water: A quantitative thermodynamic interpretation.** Ziemniak, S.E. Knolls Atomic Power Lab., Schenectady, NY (United States). May 1995. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC12-76SN00052. Order Number DE95012294. Source: OSTI; NTIS; INIS; GPO Dep.

Dissolution reaction equilibria for α-quartz (SiO_2) and corundum (α-Al_2O_3) in pure, supercritical water are quantified using a density-dependent thermodynamic model. The database of existing solubility literature for α-quartz (0.2-10 kb, 200–575°C) is shown to be consistent with the presence of two hydrolyzed SI(IV) ion forms: $Si(OH)_4(aq)$ and $Si_2O(OH)_6(aq)$; the corundum database (1-20 kb, 400–700°C) is consistent with $Al(OH)_3(aq)$ and $Al(OH)_4^-$. A third Si(IV) ion hydroxocomplex, $Si_2O_2(OH)_5^-$, is indicated at lower pressures (0.03-0.10 kb). The characteristic sigmoidal nature of the solubility isobars is explained by dimerization of $Si(OH)_4(aq)$ (at high densities) or the formation of anionic hydrolysis products, $Si_2O_2(OH)_5^-$ and $Al(OH)_4^-$, in the low density region ($p < 0.01$ gm/cc). By means of the evaluated equilibria, thermochemical properties of $Si_2O(OH)_6(aq)$ and $Si_2O_2(OH)_5^-$ are made available for the first time.

21710 (LBL–36640) **Energy states and energy flow near the transition states of unimolecular reactions.** Moore, C.B. (Univ. of California, Berkeley, CA (United States). Dept. of Chemistry). Lawrence Berkeley Lab., CA (United States). Oct 1994. 19p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract AC03-76SF00098. Grant CHE8816552; CHE9316640. (CONF-9410349–1: 38. conference on chemical research, chemical dynamics of transient species, Houston, TX (United States), 24-25 Oct 1994). Order Number DE95012385. Source: OSTI; NTIS; GPO Dep.

The use of lasers with jet-cooled samples has improved energy and angular momentum resolution for the reactant and time resolution for the rate constant by orders of magnitude. The resolution of product quantum states has added a new dimension to unimolecular dynamics. In the past, the geometry, barrier height and vibrational frequencies of the transition state in RRKM theory were adjusted to fit thermal unimolecular reaction rate data. There have been successful quantitative tests of the ability of ab initio theory to calculate transition state geometries accurately and barrier heights to a few kJ/mol for simple molecules. Predicted frequencies tend to be somewhat too high for the softest modes which are of most importance in determining rates; however, the basic normal modes and sequence of frequencies seem to be correctly predicted. RRKM theory can be used with ab initio results to predict rate constants to within a factor of two or three and may be used for quantitative extrapolation to conditions not accessible in the laboratory but important in practical situations. Experiments on single molecular eigenstates have revealed quantum statistical fluctuations in rates which are predicted quantitatively in the appropriate extension of RRKM theory. Many experiments seeking to demonstrate non-statistical or non-RRKM dynamics have demonstrated the very wide range of applicability of the RRKM model. A few such experiments have demonstrated a lack of complete vibrational energy randomization in a reactant molecule. Dynamical theory has provided an exact quantum analog to RRKM theory which will combine with future experiments to define the extent to which quantized motion along the reaction coordinate and coupling between the reaction coordinate and vibrational degrees of freedom at the transition state are important. 42 refs., 11 figs.

21711 (MAE–303) **A thermodynamical formulation for chemically active multi-phase turbulent flows.** Ahmadi, G.; Cao, J. Clarkson Univ., Potsdam, NY (United States). Dept. of Mechanical and Aeronautical Engineering. Mar 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91297. Order Number DE95015964. Source: OSTI; NTIS; GPO Dep.

A generalized thermodynamics for chemically active multiphase solid-fluid mixtures in turbulent state of motion is formulated. The global equations of balance for each phase are ensemble averaged and the local conservation laws for the mean motions are derived. The averaged and the local conservation laws for the mean motions are derived. The averaged form of the Clausius-Duhem inequality is used and the thermodynamics of the chemically active mixtures in turbulent motion is studied. Particular attention is given to the species concentration and chemical reaction effects, in addition to transport and interaction of the phasic fluctuation energies. Based on the averaged entropy inequality, constitutive equations for the stresses, energy, heat and mass fluxes of various species are developed. The explicit governing equations of motion are derived and discussed.

21712 (NEDO-IT–9209) **Investigation on cluster science.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1993. 201p. (In Japanese). Order Number DE95786809. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

Investigation and report were made on characteristics of dynamic clusters, their stabilization method, characteristics of stabilized clusters, etc. In the experimental elucidation of characteristics of

gas phase dynamic clusters, reported are anion polymerization inside metal clusters, alloy clusters and acrylonitrile clusters, cluster formation by hydrogen bond among water molecules, carbon clusters and fullerene, etc. In theoretical elucidation, reported are studies on molecular dynamics relating to water cluster, the electronic state of fullerene, etc. As to characteristics of solid dynamic clusters, reported are carbon nanotube, silver clusters in silver salt photosensitive materials, etc. With relation to the stabilized method of clusters and characteristics of stabilized clusters, reported are synthesis of cluster using zeolite lattice space, light and magnetic characteristics of alkaline metal clusters, catalytic action of molecular metal clusters, etc. 328 refs., 119 figs., 10 tabs.

21713 (NEDO-IT–9320) **Investigation on cluster science.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1994. 189p. (In Japanese). Order Number DE95786808. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

Investigation was made on cluster science to establish a new material science and develop basic technology for material development, etc. Clusters are an intermediate species existing between solid or liquid and individual atoms/molecules. A small number of atoms/molecules are connected by weak interaction and become a structure unit of material, showing interesting stratous physical properties. The cluster-system photovoltaic reaction secretly keeps a possibility of spectroscopically detecting the reaction transition state, and expansion of methodology to the general system is anticipated. Internal motion of clusters is nonlinear, and its dynamics has a possibility of elucidating fluctuations and reaction around the equilibrium structure and essence of physical property manifestation. If taking clusters as new reaction intermediates/reaction field, it will be possible to synthesize clusters aiming at reaction control and chemically design new substances. It is thought that clusters are not only an object for study as minority many-body system but also what provides useful means of reaction/physical property control. 219 refs., 118 figs., 6 tabs.

21714 (PNL-SA–25493) **A high yield reverse micelle synthesis of catalysts and catalyst precursors.** Linehan, J.C.; Matson, D.W.; Darab, J.G.; Fulton, J.L. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9504141–2: Advanced techniques in catalyst preparations syposium, Anaheim, CA (United States), 2-7 Apr 1995). Order Number DE95010723. Source: OSTI; NTIS; GPO Dep.

Reverse micelles or water-in-oil microemulsions have been prepared using a mixed AOT/SDS surfactant to increase the stability of the microemulsion and thereby allow a high loading of particle-forming precursors in the aqueous cores. The Modified Reverse Micelles (MRM), as these new binary surfactant microemulsions are called, have proven useful for the laboratory-scale synthesis of nanoscale metals, metal oxides, metal sulfides, and mixed metal materials. The system allows control over the phase and size of the precipitated crystallites and is ideal for producing nanocrystalline powders and suspensions.

21715 (RISO-R–818(EN)) **A study of cooperative effects in polyfunctional molecules.** Lund Joergensen, B. Risoe National Lab., Roskilde (Denmark). Environmental Science and Technology Dept.; Roskilde Universitetscenter (Denmark). Mar 1995. 57p. Order Number DE95787743. Source: OSTI; NTIS; Also available from Risoe Library, P.O. Box 49, DK-4000 Roskilde, Denmark.

On the basis of the development in the area of polyfunctional molecules, the effect of having functional groups close together, is investigated. At first the traditional description of polymers such as polyelectrolytes and polyacids are presented. A group of simple benzoic acid derivatives with a varying number of carboxylic acid groups are used as model systems. Titrations on mellitic acid are performed with varying ionic strength. The thermodynamic properties of ionization of polycarboxylic acids are described from literature data. As the picture of the behaviour of the acids are very complex, the effects are separated in internal and external contributions. The internal effect are found from semi-empirical calculations performed with the PC-program HyperChem™. The heat of formation in vacuum are found from the optimized structures, which are calculated with the PM3 method, and this gives an expression for the internal effects in the molecule. The knowledge achieved about the internal effects in polyfunctional molecules can contribute to the understanding of their behaviour. The surroundings are still of vital significance, so a simple method for prediction of the behaviour in a variety of surroundings can not be achieved. (au) 11 tabs., 23 ills., 96 refs.

21716 (SAND–95-0932C) **Characterization of microenvironment polarity and solvent accessibility of polysilsesquioxane xerogels by the fluorescent probe technique.** Shea, K.J. (Univ., of California, Irvine, CA (United States). Dept. of Chemistry); Zhu, H.D.; Loy, D.A. Sandia National Labs., Albuquerque, NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950297–1: American Chemical Society spring meeting, Anaheim, CA (United States), 2 Feb 1995). Order Number DE95011874. Source: OSTI; NTIS; GPO Dep.

Poly (1, 4 bis(triethoxysilyl)benzene) (PTESB), a representative of a new type of organic-inorganic hybrid polysilsesquioxane material, was characterized by fluorescence spectroscopy for both microenvironmental polarity and solvent accessibility. A dansyl fluorescent molecule was incorporated into the bulk as well as onto the surface of both PTESB and silica materials. Information about the microenvironment polarity and accessibility of PTESB to various organic solvents was determined and compared to that of silica gel. This study found that both the bulk and surface of PTESB are less polar than that of the silica material. The silica material is accessible to polar solvents and water, while YMB is accessible to polar solvents but not to water. The hydrophobicity of PTESB differentiates these new materials from silica gel.

21717 (FEI–2393) **Problems of synthesis and generating properties of uranium containing inorganic liquid on the basis of phosphorus oxychloride activated with neodymium.** Dobrovol'skij, A.F.; D'yachenko, P.P.; Seregina, E.A.; Tikhonov, G.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1994. 10p. (In Russian). Order Number DE95633015. Source: OSTI; NTIS (US Sales Only); INIS.

In this paper the results of research of uranium containing lasants on the basis of phosphorus oxychloride made in accordance with our technology are presented. It is shown that U(IV)-impurities in these lasants are absent. The inactive loss coefficient of the uranium containing lasant at λ=1050 nm coincides with the inactive loss coefficient of standard inorganic liquid lasant without uranium. The research of the amplitude and the shape of generation impulses in dependence upon pumping energy and the spectral structure of flashlamp pumping are performed. 2 refs.; 5 figs.

21718 (FEI–2394) **Consideration of the application of D_2O:Eu^{3+}:UO_2^{2+} liquid as an active medium for nuclear pumped lasers.** D'yachenko, P.P.; Kalinin, V.V.; Seregina, E.A.; Seregin, A.A.; Tikhonov, G.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1994. 11p. (In Russian). Order Number DE95633016. Source: OSTI; NTIS (US Sales Only); INIS.

The efficiency of charged particles energy conversion to luminescence energy, lifetime of excited level, position and width of spectral lines of Eu^{3+} ions during excitation of media with nuclear reaction products have been measured for $D_2O:Eu^{3+}:UO_2^{2+}$. The research was performed by the use of the neutron generator KG-0.3 IPPE. It was found out that during nuclear pumping the lifetime of the level $^5D_0$ of Eu^{3+}-ions depended very slightly on the UO_2^{2+}-concentration however during optical pumping the lifetime was inversely proportional to $C_{UO_{22+}}$. In the paper the estimate of several parameters for NPL based on liquid $D_2O:Eu^{3+}:UO_2^{2+}$ is submitted. 7 refs.; 3 figs.; 2 tabs.

21719 (FEI–2395) **Subthreshold diagnostics and features of uranium-containing laser-active liquid on the basis of sulfuryl.** Dobrovol'skij, A.F.; D'yachenko, P.P.; Kalinin, V.V.; Seregina, E.A. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1994. 13p. (In Russian). Order Number DE95633017. Source: OSTI; NTIS (US Sales Only); INIS.

Results of the subthreshold diagnostic of new uranium containing lasants on the basis of sulfuryl are presented. The research was performed on KG-0.3 IPPE accelerator. The charged particle pumping efficiency of neodymium ions in sulfuryl is slightly less than phosphorus oxychloride. The generation properties of Nd^{3+} ions into sulfuryl with and without uranyl are investigated by flash-lamp pumping. It has been found that the photoreduction of uranyl in this medium is reversible. 11 refs.; 5 figs.; 1 tab.

Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950917–10: 5. international conference on radioactive waste management and environmental remediation, Berlin (Germany), 3-9 Sep 1995). Order Number DE95011570. Source: OSTI; NTIS; INIS; GPO Dep.

Studies at Hanford in the 1980s revealed the potential for actinides to form stable soluble complexes in alkaline media, simulating radioactive tank waste. Pu(IV) hydrous oxide and Pu(VI) solubility increased with hydroxide concentration, ionic strength, and aluminate/carbonate concentrations. Subsequent contacts between US and Russian researchers in 1993 led to a technical literature review of the chemistry of TRU and Tc in alkaline media; this review addresses oxidation states, solubility, speciation, redox reactions, electrochemistry, radiation chemistry, and separations in alkaline media. As an outgrowth, a program of fundamental and applied chemistry studies of TRU and Tc is being conducted at IPC/RAS with US DOE support: solubility, redox reagents, coprecipitation, and radiation chemistry. This overview provides information on the Hanford Site tank waste system, US DOE technological needs, and IPC/RAS developments.

21721 (LUTFD2-TFCP–1003) **On modeling of unsteady combustion utilizing continuum mechanical mixture theories and large eddy simulations.** Fureby, C. Lund Univ. (Sweden). Dept. of Combustion Physics. Apr 1995. 82p. Order Number DE95779293. Source: OSTI; NTIS.

This thesis considers the development of a consistent set of Large Eddy Simulation (LES) models for unsteady combustion. The theoretical background for the simulation models is modern continuum mechanical mixture theories, which provide the necessary framework for a hierarchical structure of theoretical models. Furthermore, this theoretical framework includes multi-temperature mixtures as well as multi-phase flows. Instead of increasing the capability of the theoretical model to encompass such processes, the theoretical model contains these elements from the beginning. Consequently, the model can systematically be reduced to give models for a large number of processes or systems. This is more attractive compared to the traditional approach, due to the generality and the high degree of adaptability. Since the aim is to study unsteady combustion processes, a simulation model having high spatial and temporal resolution is needed. Due to the well known resolution problem, some degree of phenomenology must inevitably be included in the physical model to replace some processes occurring at a microscopic level. This leads us to the Large Eddy Simulation methodology. A LES model has therefore been developed to encompass the theoretical model above. The LES model is cast into a numerical simulation model by a finite volume discretization and high-order interpolation approximations for the fluxes. In order to investigate the predictive capabilities of this LES model, numerical simulations have been performed on several configurations corresponding to test rigs or objects for which experimental data is available. Comparison indicate that, in all cases investigated, the LES model gives reliably predictions. 187 refs, 4 figs

Norsk Inst. for Luftforskning, Kjeller (Norway). Mar 1994. (CONF-9312108–: NORSAC '93: 3. Nordic symposium on atmospheric chemistry, Geilo (Norway), 3-5 Dec 1993). In *Third Nordic symposium on atmospheric chemistry. Proceedings of NORSAC '93.* 234p. Order Number DE95787846. Source: OSTI; NTIS.

The paper presents the measured results of the absorption spectra of SO_2, NO, and NO_2 in UV and visible regions. The authors have used the differential absorption technique based on the difference at molecular absorption cross sections in the maximum and minimum of absorption and thus enabling the measurement of air pollutant concentrations. They have employed 2 m path length cell and Xenon flash-lamp as the light source for the investigation of gases in the laboratory. The same measurements were carried out in the enterprise "Thermal plant of Alytus". The absorption cross sections of NO_2 and SO_2 have rather strong temperature dependence. It was possible to determine presence of SO_2 and NO_2 because of a general electronic absorption. As a result of these investigations, a unit for the measurement of sulphur and nitrogen dioxides was designed. The calibration of the unit was performed using "Testoterm" equipment as a reference. 6 figs.

21723 (SAND–95-8508J) **Thermal-grating contributions to degenerate four-wave mixing in nitric oxide.** Danehy, P.M. (Stanford Univ., Stanford, CA (United States). High Temperature Gasdynamics Laboratory); Paul, P.H.; Farrow, R.L. Sandia National Labs., Livermore, CA (United States). [1995]. 34p. Sponsored by USDOE, Washington, DC (United States);Department of the Air Force, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95010914. Source: OSTI; NTIS; GPO Dep.

We report investigations of degenerate four-wave mixing (DFWM) line intensities in the $A^2\Sigma^+ \leftarrow X^2\Pi$ electronic transitions of NO. Contributions from population gratings (spatial perturbations in the level populations of absorbing species), and thermal gratings (spatial perturbations in the overall density) were distinguished and compared using several experimental and analytical techniques. For small quantities of NO in a strongly quenching buffer gas (CO_2), we found that thermal-grating contributions dominated at room temperature for gas pressures of ~0.5 atm and higher. In a nearly non-quenching buffer (N_2) the population-grating mechanism dominated at pressures of ≈1.0 atm and lower. At higher temperatures in an atmospheric-pressure methane/air flame, population gratings of NO were also found to dominate. We propose a simple model for the ratio of thermal- to population-grating scattering intensities that varies as P_4T^{-4-4}. Preliminary investigations of the temperature dependence and detailed studies of the pressure dependence are in agreement with this model. Measurements of the temporal evolution and peak intensity of isolated thermal-grating signals are in detailed agreement with calculations based on a linearized hydrodynamic model.

21724 (UCRL-JC–120938) **A modelling study of the combustion of n-heptane and iso-octane in a high pressure**

turbulent flow reactor. Curran, H.J. (Lawrence Livermore National Lab., CA (United States)); Gaffuri, P.; Pitz, W.J.; Westbrook, C.K.; Callahan, C.; Dryer, F.L.; Held, T. Lawrence Livermore National Lab., CA (United States). 13 Apr 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9504163–3: Combustion Institute and American Flame Research onference, San Antonio, TX (United States), 23-26 Apr 1995). Order Number DE95013440. Source: OSTI; NTIS; GPO Dep.

The primary reference fuels n-heptane and iso-octane and their mixtures are used as a measure of the tendency of a given automotive fuel to cause knocking or pre-ignition in an internal combustion engine. Consequently, many experimental studies have been performed on these hydrocarbons in an attempt to better understand their oxidation. Shock tube studies at high temperature and pressure have been performed. Low temperature studies, in which species concentration profiles of primary, intermediate and final products, have been carried out using jet stirred flow reactors. In addition, experiments have been performed in CFR engines and fundamental features of n-heptane autoignition have been observed using a rapid compression machine. A detailed chemical kinetic reaction mechanism is employed here to study the oxidation of both fuels. Computed results are compared with experimental data obtained in the High Pressure Turbulent Flow Reactor at Princeton University.

Located 35 miles West of Idaho Falls, Idaho, Argonne National Laboratory-West operates a number of nuclear facilities for the Department of Energy (DOE) through the University of Chicago. Part of the present mission of Argonne National Laboratory-West includes shutdown of the EBR-II Reactor. In order to accomplish this task the Engineering-Drafting Department is exploring cost effective methods of providing as-building services. A new technology of integrating photographic images and AUTOCAD drawing files is considered one of those methods that shows promise.

The Mars Pathfinder spacecraft, scheduled for launch in November 1996, is designed to validate a low cost Entry, Descent, and Landing system and to perform scientific surface operations. The Jet Propulsion Laboratory and Sandia National Laboratories teamed to design, fabricate, test and validate a prototype 0.38 scale model of an airbag impact attenuation system. A computer code was developed to predict the performance of the airbag system. A test program in Sandia's High Altitude Chamber was performed to validate the code and demonstrate the feasibility of the airbag concept and design. In addition, freefall tests were performed at representative velocities to demonstrate the structural integrity of the airbag system design. The feasibility program demonstrated that the airbag impact attenuation design will protect the lander upon impact with the Martian surface.

In the late 1980's, ANL-W Management foresaw a need to provide dedicated technical support for maintenance supervisors. Maintenance supervisors were facing increased challenges to ensure all environmental, safety, and waste management regulations were followed in daily maintenance activities. This increased burden was diverting supervisory time away from on-the-job supervision. Supervisors were finding less time for their "mentor" roles to ensure maintenance focused on finding and correcting root causes. Additionally the traditional maintenance organization could not keep up with the explosion in predictive maintenance technologies. As a result, engineers were tasked to provide direct technical support to the maintenance organization. Today the maintenance technical support group consists of two mechanical engineers, two electrical engineers and an I&C engineer. The group provides a readily available, quick response resource for crafts people and their supervisors. They can and frequently do ask the support group for help to determine the root cause and to effect permanent fixes. Crafts and engineers work together informally to make an effective maintenance team. In addition to day-to-day problem solving, the technical support group has established several maintenance improvement programs for the site. This includes vibration analysis of rotating machinery, testing of fuel for emergency diesel generators, improving techniques for testing of high efficiency particulate air (HEPA) filters, and capacity testing of UPS and emergency diesel starting batteries. These programs have increased equipment reliability, reduced conventional routine maintenance, reduced unexpected maintenance, and improved testing accuracy. This paper will discuss the interaction of the technical support group within the maintenance department. Additionally the maintenance improvement programs will be presented along with actual cases encountered, the resolutions and lessons learned.

21728 (ANL/TD/CP–84983) **Accelerator requirements for fast-neutron interrogation of luggage and cargo.** Micklich, B.J.; Fink, C.L.; Yule, T.J. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by Federal Aviation Administration, Washington, DC (United States);Executive Office of the President, Washington, DC (United States). DOE Contract W-31109-ENG-38. Contract DTFA03-03-X-00021; Contract 6-CO-160-00-195. (CONF-950512–93: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95011846. Source: OSTI; NTIS; INIS; GPO Dep.

Several different fast-neutron based techniques are being studied for the detection of contraband substances in luggage and cargo containers. The present work discusses the accelerator requirements for fast-neutron transmission spectroscopy (FNTS), pulsed fast-neutron analysis (PFNA), and 14-MeV neutron interrogation. These requirements are based on the results of Monte-Carlo simulations of neutron or gamma detection rates. Accelerator requirements are driven by count-rate considerations, spatial resolution and acceptable uncertainties in elemental compositions. The authors have limited their analyses to luggage inspection with FNTS and to cargo inspection with PFNA or 14-MeV neutron interrogation.

21729 (CIEMAT–759) **Control of a mechanical gripper with a fuzzy controller.** Alberdi, J.; Barcala, J.M.; Gamero, E.; Navarrete, J.J. No corporate text available. 1995. 37p. (In Spanish). Order Number DE95780848. Source: OSTI; NTIS.

A fuzzy logic system is used to control a mechanical gripper. System is based in a NLX230 fuzzy micro controller. Control rules are programmed by a 68020 microprocessor in the micro controller

memory. Stress and its derived are used as feedback signals in the control. This system can adapt its effort to the mechanical resistance of the object between the fingers.

21730 (CONF-9505195–5) **Nuclear data for criticality safety - current issues.** Leal, L.C.; Jordan, W.C.; Wright, R.Q. Oak Ridge National Lab., TN (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Nuclear criticality technology and safety project (NCTSP) annual meeting; San Diego, CA (United States); 17 May 1995. Order Number DE95013216. Source: OSTI; NTIS; INIS; GPO Dep.

Traditionally, nuclear data evaluations have been performed in support of the analysis and design of thermal and fast reactors. In general, the neutron spectra characteristic of the thermal and fast systems used for data testing are predominantly in the low- anc high-energy range with a relatively small influence from the intermediate-energy range. In the area of nuclear criticality safety, nuclear systems arising from applications involving fissionable materials outside reactors can lead to situations very different from those most commonly found in reactor analysis and design. These systems are not limited to thermal or fast and may have significant influence from the intermediate energy range. The extension of the range of applicability of the nuclear data evaluation beyond thermal and fast systems is therefore needed to cover problems found in nuclear criticality safety. Before criticality safety calculations are performed, the bias and uncertainties of the codes and cross sections that are used must be determined. The most common sources of uncertainties, in general, are the calculational methodologies and the uncertainties related to the nuclear data, such as the microscopic cross sections, entering into the calculational procedure. The aim here is to focus on the evaluated nuclear data pertaining to applications in nuclear criticality safety.

21731 (DOE/MC/30362–4049) **BOA: Asbestos pipe insulation removal robot system. Phase 1.** Schempf, H.; Bares, J.E. Carnegie-Mellon Univ., Pittsburgh, PA (United States). Robotics Inst. Feb 1995. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AR21-93MC30362. Order Number DE95000095. Source: OSTI; NTIS; GPO Dep.

The project described in this report targets the development of a mechanized system for safe, cost-efficient and automated abatement of asbestos containing materials used as pipe insulation. Based on several key design criteria and site visits, a proof-of-concept prototype robot system, dubbed BOA, was designed and built, which automatically strips the lagging and insulation from the pipes, and encapsulates them under complete vacuum operation. The system can operate on straight runs of piping in horizontal or vertical orientations. Currently we are limited to four-inch diameter piping without obstacles as well as a somewhat laborious emplacement and removal procedure - restrictions to be alleviated through continued development. BOA removed asbestos at a rate of 4-5 ft./h compared to 3 ft./h for manual removal of asbestos with a 3-person crew. The containment and vacuum system on BOA was able to achieve the regulatory requirement for airborne fiber emissions of 0.01 fibers/ccm/8-hr. shift. This program consists of two phases. The first phase was completed and a demonstration was given to a review panel, consisting of DoE headquarters and site representatives as well as commercial abatement industry representatives. Based on the technical and programmatic recommendations drafted, presented and discussed during the review meeting, a new plan for the Phase 11 effort of this project was developed. Phase 11 will consist of a 26-month effort, with an up-front 4-month site-, market-, cost/benefit and regulatory study before the next BOA robot (14 months) is built, and then deployed and demonstrated (3 months) at a DOE site (such as Fernald or Oak Ridge) by the beginning of FY'97.

21735 (JAERI-Review–95-001) **Report of the 2nd through 7th conferences of Special Committee on Nuclear Criticality Safety.** Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1995. 194p. (In Japanese). Order Number DE95780588. Source: OSTI; NTIS; INIS.

Special committee on Nuclear Criticality Safety was established as a public committee of Atomic Energy Society of Japan in November, 1988. The main objectives of this committee are to contribute to reasonable criticality safety design/control through extensive discussions among the specialists of reactor physics, fuel treatment process and radiation surveillance technique and so on. The conferences were held totally seven times. This report concerns with the activities of this committee in the 2nd (1989) through 7th (1992) conferences. (author).

21736 (JAERI-Tech–95-025) **Calculational study on reactivity effect of pipe intersections.** Okuno, Hiroshi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Naito, Yoshitaka; Kaneko, Toshiyuki. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 26p. (In Japanese). Order Number DE95780610. Source: OSTI; NTIS; INIS.

A simple formulation was proposed for evaluating the increment of reactivity due to the attachment of pipes to a vessel filled with fuel solution, and its validity was checked by numerical calculations. The formulation was based on the neutron balance equation which had been applied to the criticality safety analysis code MUTUAL for multi-unit systems, and the current formulation considered further the deviation of the representative neutron source point from the center of each pipe. The formulation was validated for models of 2- and 3-dimensional fuel systems by comparison with the precise calculations using the Monte Carlo code KENO-IV. For systems of pipes attached perpendicularly to the side of a cylindrical vessel, the size and number of negligible pipes were shown that corresponded to a very small increment (e.g. 0.3% $\Delta k/k$) of the neutron multiplication factor. (author).

21737 (LA–12556-C, pp. 12-20) **Verification of MMES five plant criticality software.** Petrie, L. (Oak Ridge National Lab., TN (United States)). Los Alamos National Lab., NM (United States). Sep 1994. (CONF-9205206–: DOE nuclear criticality safety technology project workshop, Gaithersburg, MD (United States), 12-14 May 1992). In *Proceedings of the first annual Nuclear Criticality Safety Technology Project.* 251p. Order Number DE95000557. Source: OSTI; NTIS; INIS; GPO Dep.

Martin Marietta Energy Systems, Inc., has just finished installing and verifying a new set of nuclear criticality software for use by the criticality safety groups at the five plants operated by MMES for the DOE. This talk reports some of the results obtained in doing the verification of the KENOV.a code as well as some for the XSDRN code. The software codes installed are based on the latest version of the SCALE system, 4.1, but are maintained separately under an independent configuration control plan. The slides that follow give a number of analytically critical (K-eff=1.0) simple systems in spherical, cylindrically and slab geometry, followed by the results of calculating these systems with KENO and XSDRN. The cross section parameters and dimensions necessary to define these systems are given along with a picture to aid in visualizing the system. The

results show that KENO and XSDRN calculate these simple systems correctly, verifying the overall flow for these simple systems. For XSDRN these calculations cover most of the useful options available, but for KENO there are many geometric options for which there are no analytic solutions. For these systems it is necessary to do validation calculations against experiments to verify that the code correctly treats the more complicated geometries.

21738 (LA–12556-C, pp. 21-34) **Validation of MCNP for criticality calculations.** Briesmeister, J.F. (Los Alamos National Lab., NM (United States)). Los Alamos National Lab., NM (United States). Sep 1994. (CONF-9205206–: DOE nuclear criticality safety technology project workshop, Gaithersburg, MD (United States), 12-14 May 1992). In *Proceedings of the first annual Nuclear Criticality Safety Technology Project.* 251p. Order Number DE95000557. Source: OSTI; NTIS; INIS; GPO Dep.

The MCNP philosophy focuses on three topics: quality, value, and new features, in that order. MCNP is a general-purpose continuous-energy Monte Carlo code developed and maintained by Group X-6 at the Los Alamos National Laboratory. Problems with neutrons, photons, and electrons as either single particle or coupled particles can be calculated with MCNP. When measurements are impractical, MCNP is an alternative calculational tool for comparison with other criticality computer codes and cross-section data bases. The primary focus of MCNP is quality. In addition to a long history and a wide variety of applications, MCNP has rigorous change control procedures, including peer review and code walkthroughs. We have established procedures by which the code is updated and of how problems are identified and corrected. A process of deciding what new features will be added exists, followed by a rigorous testing methods. New versions can be identified and are released in a controlled manner. Three benchmark documents exist, two prepared by LANL and one by GE. The documents have all the input files included as appendices so that anyone can duplicate identically the problems run. Contact X-6 to request copies of these documents.

21739 (LA–12556-C, pp. 35-49) **Validation of criticality safety calculations with subcriticality measurements by the ^{252}Cf-source-driven noise method.** Mihalczo, J.T. (Oak Ridge National Lab., TN (United States)); Krass, A.W.; Valentine, T.E.; Ficaro, E.P. Los Alamos National Lab., NM (United States). Sep 1994. (CONF-9205206–: DOE nuclear criticality safety technology project workshop, Gaithersburg, MD (United States), 12-14 May 1992). In *Proceedings of the first annual Nuclear Criticality Safety Technology Project.* 251p. Order Number DE95000557. Source: OSTI; NTIS; INIS; GPO Dep.

The ^{252}Cf-source-driven noise analysis method has successfully measured the subcritical neutron multiplication factor k for a wide variety of fissile systems. The recent modifications of the KENO Va Monte Carlo code to calculate directly the measured noise analysis data allow the use of this experimental data for validation of calculational methods and cross sections. High sensitivity of noise-measured parameters to small changes in fissile systems has been observed in several measurements. To investigate this sensitivity, a series of calculations was performed for a 3 by 3 array of PWR spent-fuel elements in unborated water. The macroscopic fission-product cross sections were changed, and the resulting ratios of spectral densities, coherence between detectors, and values of k were obtained from this Monte Carlo simulation of the measurement. The sensitivity of the ratios of spectral densities and coherences to changes in fission-product cross sections were a factor of 10 and 4°, respectively, more than that of k. These Monte Carlo calculations have shown that this type of subcritical measurement can be used to benchmark fission-product cross sections for spent PWR fuel and, because of the high sensitivity of the noise analysis quantities, would provide a more stringent test of the fission-product cross sections than comparison of calculation with experiments at delayed criticality, even though the value of k can be measured more accurately at delayed criticality.

21740 (LA–12556-C, pp. 50-52) **Criticality safety database.** Beasley, M.; Rutkowski, R. Los Alamos National Lab., NM (United States). Sep 1994. (CONF-9205206–: DOE nuclear criticality safety technology project workshop, Gaithersburg, MD (United States), 12-14 May 1992). In *Proceedings of the first annual Nuclear Criticality Safety Technology Project.* 251p. Order Number DE95000557. Source: OSTI; NTIS; INIS; GPO Dep.

The Nuclear Criticality Safety (NCS) Database is being developed by OSTI at the request of NE-74 to help workers in the area of nuclear criticality safety to accomplish their mission. It is a bibliographic database resident on the OSTI VAX cluster, and can be searched by BASIS software.

21741 (LA–12556-C, pp. 53-58) **Validation of MCNP with X6.XS cross-section set on the SUN Sparc Station 1+ computer for nominally 5 weight percent ^{235}U enriched uranium systems.** Lewis, K.D. (Martin Marietta Energy Systems, Inc., Oak Ridge, TN (United States)). Los Alamos National Lab., NM (United States). Sep 1994. (CONF-9205206–: DOE nuclear criticality safety technology project workshop, Gaithersburg, MD (United States), 12-14 May 1992). In *Proceedings of the first annual Nuclear Criticality Safety Technology Project.* 251p. Order Number DE95000557. Source: OSTI; NTIS; INIS; GPO Dep.

The national Atomic Vapor Laser Isotope Separation (AVLIS) project has conducted extensive nuclear criticality safety analyses both in the design of Uranium Demonstration System (UDS) equipment and in AVLIS plant design/plant deployment activities. Currently, the design limit of an AVLIS plant calls for uranium product enriched in ^{235}U to 5 wt %. Since an objective of an AVLIS plant is to deliver its product in a form readily usable by customers, uranium enriched in ^{235}U will appear in a variety of forms, including metallic; as oxides, e.g., UO_2, UO_3; as fluorides, e.g., UF_6, UF_4, UO_2F_2; as nitrates or nitrides, e.g., $UO_2(NO_3)_2$; and perhaps as uranium salts mixed with hydrocarbons such as oil. A wide range of neutron moderation levels, ranging from zero to optimal, and beyond can also be anticipated in an AVLIS plant, because of decontamination and cleaning activities and other wet chemistry processes that may be required.

21742 (LA–12556-C, pp. 60-63) **Regulatory impacts on code validation and use.** McKamy, J. Los Alamos National Lab., NM (United States). Sep 1994. (CONF-9205206–: DOE nuclear criticality safety technology project workshop, Gaithersburg, MD (United States), 12-14 May 1992). In *Proceedings of the first annual Nuclear Criticality Safety Technology Project.* 251p. Order Number DE95000557. Source: OSTI; NTIS; INIS; GPO Dep.

The Criticality Engineering Programs branch of Nuclear Safety Engineering at EG&G Rocky Flats is in the process of developing procedures for KENO code validation which demonstrate compliance with the requirements of DOE Order 5700.6B (NQA-1). Detailed and documented processes must be implemented to acquire, install, and validate the codes. Many of the requirements of DOE Order 5700.6B simply require documenting "good practices," while others are not possible due to the nature of verifying and validating 20-year-old codes against 30-year-old benchmarks.

21743 (LA–12556-C, pp. 64-65) **Validation philosophy.** Vornehm, D. (Martin Marietta Energy Systems, Inc., Oak Ridge, TN (United States)). Los Alamos National Lab., NM (United States). Sep 1994. (CONF-9205206–: DOE nuclear criticality safety technology project workshop, Gaithersburg, MD (United States), 12-14 May 1992). In *Proceedings of the first annual Nuclear Criticality Safety Technology Project.* 251p. Order Number DE95000557. Source: OSTI; NTIS; INIS; GPO Dep.

To determine when a set of calculations falls within an umbrella of an existing validation documentation, it is necessary to generate a quantitative definition of range of applicability (our definition is only qualitative) for two reasons: (1) the current trend in our regulatory environment will soon make it impossible to support the legitimacy of a validation without quantitative guidelines; and (2) in my opinion, the lack of support by DOE for further critical experiment work is directly tied to our inability to draw a quantitative "line-in-the-sand" beyond which we will not use computer-generated values.

21744 (LA–12556-C, pp. 66-69) **The need for critical experiments.** Rothe, R.E. Los Alamos National Lab., NM (United States). Sep 1994. (CONF-9205206–: DOE nuclear criticality safety technology project workshop, Gaithersburg, MD (United States), 12-14 May 1992). In *Proceedings of the first annual Nuclear Criticality*

Safety Technology Project. 251p. Order Number DE95000557. Source: OSTI; NTIS; INIS; GPO Dep.

This article reports the authors opinion on the funding of criticality experiments in the United States. The author believes that the potential for nuclear criticality experiments in the country is on the rise, and should be keep in check by the construction of new laboratories or the refurbishment of existing facilities to study criticality safety.

21745 (LA–12556-C, pp. 70-80) **SHEBA: Modifications to a low-enrichment-solution critical assembly.** Butterfield, K.B. (Los Alamos National Lab., NM (United States)). Los Alamos National Lab., NM (United States). Sep 1994. (CONF-9205206–: DOE nuclear criticality safety technology project workshop, Gaithersburg, MD (United States), 12-14 May 1992). In *Proceedings of the first annual Nuclear Criticality Safety Technology Project.* 251p. Order Number DE95000557. Source: OSTI; NTIS; INIS; GPO Dep.

The SHEBA solution assembly has been modified to operate either in a below-ground crypt to provide radiation shielding or aboveground for dosimetry measurements. Other modifications include better solution depth measurements, improved flow control, and possible burst operation capability. SHEBA uses 5% enriched uranyl fluoride fuel and is controlled with a digital process control system. The current status has the mechanical hardware completed and the approval for operations process started. Water tests are underway, and we are working to develop an ultrasonic-level measurements system that will have 0.1-mm resolution at the critical depth of ~ 40 cm.

21746 (LA–12556-C, pp. 95-106) **Evaluating criticality safety of TRU waste with NDA measurements and risk analyses.** Hochel, R.C.; Hofstetter, K.J.; Sigg, R.A.; Winn, W.G.; Chay, S.C. Los Alamos National Lab., NM (United States). Sep 1994. (CONF-9205206–: DOE nuclear criticality safety technology project workshop, Gaithersburg, MD (United States), 12-14 May 1992). In *Proceedings of the first annual Nuclear Criticality Safety Technology Project.* 251p. Order Number DE95000557. Source: OSTI; NTIS; INIS; GPO Dep.

The criticality safety of ^{239}Pu in 55-gal. drums stored in TRU waste containers (concrete culverts) was evaluated using NDA neutron and gamma measurements and risk analyses. The neutron measurements yielded a ^{239}Pu mass and k_{eff} for a culvert, which contains up to 14 drums. The gamma measurements helped reveal and correct for any interfering neutron sources in the waste. Conservation probabilistic risk analyses were developed for both drums and culverts.

21747 (LA–12556-C, pp. 107-110) **An improved criticality alarm system.** Tyree, W.H. (EG&G Rocky Flats, Golden, CO (United States)); Gilpin, H.E.; Balmer, D.K.; Vennitti, D.A. Los Alamos National Lab., NM (United States). Sep 1994. (CONF-9205206–: DOE nuclear criticality safety technology project workshop, Gaithersburg, MD (United States), 12-14 May 1992). In *Proceedings of the first annual Nuclear Criticality Safety Technology Project.* 251p. Order Number DE95000557. Source: OSTI; NTIS; INIS; GPO Dep.

The Rocky Flats Plant near Golden, Colorado is the primary facility for the production of plutonium components used in the US arsenal of nuclear weapons. It is operated by EG&G under contract to the US Department of Energy (DOE). There are ten production buildings on plant site with neutron based criticality alarm systems. These systems have been in operation for the past seventeen years. Changes in the interpretation of A.N.S.I. standards and DOE Orders have precipitated an evaluation of detector sensitivity and placement criteria. As a result of this evaluation, improvements in detector design and calibration have improved detector sensitivity by a factor of six. Testing performed on the design defined a minimum sensitivity as required by A.N.S.I. 8.3 and provided information for saturation and survivability for a fission event of up to $1X10^{17}$ fissions in 80 microseconds. A rigorous testing and calibration program has been developed and is in place. Neutron sensitivity is certified at a nearby reactor which is traceable to N.I.S.T.

21748 (LA–12556-C, pp. 111-119) **University programs: Benchmarking computer codes.** Busch, R. Los Alamos National Lab., NM (United States). Sep 1994. (CONF-9205206–: DOE nuclear criticality safety technology project workshop, Gaithersburg, MD (United States), 12-14 May 1992). In *Proceedings of the first annual Nuclear Criticality Safety Technology Project.* 251p. Order Number DE95000557. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper was a presentation and discussion of the features of the Lady Godiva test reactor and its present/past/future projects. The results of a number of geometries and enrichments were presented.

21749 (LA–12556-C, pp. 120-126) **Fissile solution dynamics: Student research.** Hetrick, D.L. Los Alamos National Lab., NM (United States). Sep 1994. (CONF-9205206–: DOE nuclear criticality safety technology project workshop, Gaithersburg, MD (United States), 12-14 May 1992). In *Proceedings of the first annual Nuclear Criticality Safety Technology Project.* 251p. Order Number DE95000557. Source: OSTI; NTIS; INIS; GPO Dep.

There are two research projects in criticality safety at the University of Arizona: one in dynamic simulation of hypothetical criticality accidents in fissile solutions, and one in criticality benchmarks using transport theory. We have used the data from nuclear excursions in KEWB, CRAC, and SILENE to help in building models for solution excursions. An equation of state for liquids containing gas bubbles has been developed and coupled to point-reactor dynamics in an attempt to predict fission rate, yield, pressure, and kinetic energy. It appears that radiolytic gas is unimportant until after the first peak, but that it does strongly affect the shape of the subsequent power decrease and also the dynamic pressure.

21750 (LA–12556-C, pp. 127-131) **Nuclear Criticality Safety Program at the University of Tennessee - an overview.** Dodds, H.L. (Univ. of Tennessee, Knoxville, TN (United States)). Los Alamos National Lab., NM (United States). Sep 1994. (CONF-9205206–: DOE nuclear criticality safety technology project workshop, Gaithersburg, MD (United States), 12-14 May 1992). In *Proceedings of the first annual Nuclear Criticality Safety Technology Project.* 251p. Order Number DE95000557. Source: OSTI; NTIS; INIS; GPO Dep.

The Nuclear Criticality Safety (NCS) program at the University of Tennessee is a combined academic/research program for nuclear engineering students who desire special training in NCS. Although the program is oriented toward MS degree candidates, training is also available to senior undergraduates, via an introductory NCS course, as well as PhD candidates through dissertation research projects in the NCS area.

21751 (LA–12556-C, pp. 134-148) **Nuclear criticality safety order review.** Rosenbloom, S. Los Alamos National Lab., NM (United States). Sep 1994. (CONF-9205206–: DOE nuclear criticality safety technology project workshop, Gaithersburg, MD (United States), 12-14 May 1992). In *Proceedings of the first annual Nuclear Criticality Safety Technology Project.* 251p. Order Number DE95000557. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper was the presentation and discussion of a draft DOE 5480.CRIT, "Nuclear Criticality Safety."

21752 (LA–12556-C, pp. 207-209) **Criticality Safety Training (CRITSAF).** Halladay, S. (Westinghouse Hanford Co., Richland, WA (United States)). Los Alamos National Lab., NM (United States). Sep 1994. (CONF-9205206–: DOE nuclear criticality safety technology project workshop, Gaithersburg, MD (United States), 12-14 May 1992). In *Proceedings of the first annual Nuclear Criticality Safety Technology Project.* 251p. Order Number DE95000557. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper was a brief description of a PC-based criticality safety training package. Software features and contents were noted, as well as hardware requirements.

21753 (LA–12556-C, pp. 233-237) **Evaluation techniques work group.** Choi, J.S. (Lawrence Livermore National Lab., CA (United States)). Los Alamos National Lab., NM (United States). Sep 1994. (CONF-9205206–: DOE nuclear criticality safety technology project workshop, Gaithersburg, MD (United States), 12-14 May 1992). In *Proceedings of the first annual Nuclear Criticality Safety Technology Project.* 251p. Order Number DE95000557. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper was an overview of the evaluation techniques breakout session. Topics discussed were verification/validation of computer codes and criteria for subcriticality safety margin.

21754 (LA–12925-MS) **The NMT-5 criticality database.** Cort, B.; Perkins, B.; Cort, G. Los Alamos National Lab., NM (United States). May 1995. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95012119. Source: OSTI; NTIS; INIS; GPO Dep.

The NMT-5 Criticality Database maintains criticality-related data and documentation to ensure the safety of workers handling special nuclear materials at the Plutonium Facility (TA-55) at Los Alamos National Laboratory. The database contains pertinent criticality safety limit information for more than 150 separate locations at which special nuclear materials are handled. Written in 4th Dimension for the Macintosh, it facilitates the production of signs for posting at these areas, tracks the history of postings and related authorizing documentation, and generates in Microsoft Word a current, comprehensive representation of all signs and supporting documentation, such as standard operating procedures and signature approvals. It facilitates the auditing process and is crucial to full and effective compliance with Department of Energy regulations. It has been recommended for installation throughout the Nuclear Materials Technology Division at Los Alamos.

21755 (LA-UR–95-692) **Cost effectiveness studies of environmental technologies: Volume 1.** Silva, E.M.; Booth, S.R. (eds.). Los Alamos National Lab., NM (United States). Feb 1994. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95007853. Source: OSTI; NTIS; INIS; GPO Dep.

This paper examines cost effectiveness studies of environmental technologies including the following: (1) In Situ Air Stripping, (2) Surface Towed Ordinance Locator System, (3) Ditch Witch Horizontal Boring Technology, (4) Direct Sampling Ion Trap Mass Spectrometer, (5) In Situ Vitrification, (6) Site Characterization and Analysis Penetrometer System, (7) In Situ Bioremediation, and (8) SEAMIST Membrane System Technology.

21756 (LA-UR–95-1336) **Science up to 100 tesla.** Campbell, L.J. (Los Alamos National Lab., NM (United States). National High Magnetic Field Lab.). Los Alamos National Lab., NM (United States). [1995]. 9p. DOE Contract W-7405-ENG-36. (CONF-9504132–4: Spring workshop on basic science using pulsed power, Santa Barbara, CA (United States), 5-7 Apr 1995). Order Number DE95012067. Source: OSTI; NTIS; GPO Dep.

100 Tesla is the highest attainable field that can be held for millisec in a non-destructive magnet. The strongest steels turn soft under stresses of 4GPa, which is the magnetic pressure of 100 T. Until there is a breakthrough in materials, magnets having all the low temperature and high pressure trimmings will be limited to about 100 T. Within the field range 1-100 T far more resources are now devoted to producing the highest possible continuous fields (40+5 T) than to producing longer pulsed fields above 50 T. This illustrates that the utility of the field can be more important than the strength of the field to researchers in condensed matter. Discoveries are typically made in new territory, but this can be new combinations of pressure, temperature, and magnetic field, or new probes and new materials. If any activity has kept up with the proliferation of new experiments and new facilities in high magnetic field research it is the listing of experiments that could and should be done in high fields. Part of the reason for the vitality of high field research is that high fields provide a generic environment. Compared to particle accelerators and plasma machines a high field laboratory is a setting for generic science, like synchrotron light sources or neutron scattering centers. Although the latter two installations probes states, while a magnetic field creates a state. Because it is unrealistic to try to list all the science opportunities at high fields, the author list sources for lists in the public domain and gives a few examples.

21757 (LBL–36749) **Multidimensional simulation studies of the SELENE FEL oscillator/buncher followed by a radiator/amplifier output scheme.** Hahn, S.J. (Stanford Linear Accelerator Center, Menlo Park, CA (United States)); Fawley, W.M. Lawrence Berkeley Lab., CA (United States). Feb 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-950226–49: SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine, San Jose, CA (United States), 5-14 Feb 1995). Order Number DE95012386. Source: OSTI; NTIS; GPO Dep.

We analyze and present numerical simulations of the so-called electron output scheme [G. I. Erg et al., 15th Int. FEL Conf., The Hague, The Netherlands, 1993, Book of Abstracts p. 50; Preprint Budker INP 93-75] applied to the SELENE proposal of using a high power FEL to illuminate satellite solar cells. In this scheme, a first stage FEL oscillator bunches the electron beam while a second stage "radiator" extracts high power radiation. Our analysis suggests only in the case where the radiator employs a long, tapered undulator will the electron output scheme produce a significant increase in extraction efficiency over what is obtainable from a simple, single-stage oscillator. 1- and 2-D numerical simulations of a 1.7μm FEL employing the electron output scheme show reasonably large bunching fractions ($\sim$ 0.3–0.4) at the output of the oscillator stage but only $\leq$2% extraction efficiency from the radiator stage.

21758 (NUREG/CR–5657) **AUTOCASK (AUTOmatic Generation of 3-D CASK models). A microcomputer based system for shipping cask design review analysis.** Gerhard, M.A. (Lawrence Livermore National Lab., CA (United States)); Sommer, S.C. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Industrial and Medical Nuclear Safety; Lawrence Livermore National Lab., CA (United States). Apr 1995. 128p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract W-7405-ENG-48. (UCRL-ID–118766). Source: OSTI; NTIS; GPO; INIS.

AUTOCASK (AUTOmatic Generation of 3-D CASK models) is a microcomputer-based system of computer programs and databases developed at the Lawrence Livermore National Laboratory (LLNL) for the structural analysis of shipping casks for radioactive material. Model specification is performed on the microcomputer, and the analyses are performed on an engineering workstation or mainframe computer. AUTOCASK is based on 80386/80486 compatible microcomputers. The system is composed of a series of menus, input programs, display programs, a mesh generation program, and archive programs. All data is entered through fill-in-the-blank input screens that contain descriptive data requests.

21759 (NUREG/CR–6322) **Buckling analysis of spent fuel basket.** Lee, A.S. (Lawrence Livermore National Lab., CA (United States)); Bumpas, S.E. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Industrial and Medical Nuclear Safety; Lawrence Livermore National Lab., CA (United States). May 1995. 45p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract W-7405-ENG-48. (UCRL-ID–119697). Source: OSTI; NTIS; GPO; INIS.

The basket for a spent fuel shipping cask is subjected to compressive stresses that may cause global instability of the basket assemblies or local buckling of the individual members. Adopting the common buckling design practice in which the stability capacity of the entire structure is based on the performance of the individual members of the assemblies, the typical spent fuel basket, which is composed of plates and tubular structural members, can be idealized as an assemblage of columns, beam-columns and plates. This report presents the flexural buckling formulas for five load cases that are common in the basket buckling analysis: column under axial loads, column under axial and bending loads, plate under uniaxial loads, plate under biaxial loadings, and plate under biaxial loads and lateral pressure. The acceptance criteria from the ASME Boiler and Pressure Vessel Code are used to determine the adequacy of the basket components. Special acceptance criteria are proposed to address the unique material characteristics of austenitic stainless steel, a material which is frequently used in the basket assemblies.

21760 (ORNL/TM–12294/V.1) **SCALE-4 analysis of pressurized water reactor critical configurations. Volume 1: Summary.** DeHart, M.D. Oak Ridge National Lab., TN (United States). Mar 1995. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95010421. Source: OSTI; NTIS; INIS; GPO Dep.

The requirements of ANSI/ANS 8.1 specify that calculational methods for away-from-reactor criticality safety analyses be validated against experimental measurements. If credit is to be taken for the reduced reactivity of burned or spent fuel relative to its original fresh composition, it is necessary to benchmark computational methods used in determining such reactivity worth against spent fuel reactivity measurements. This report summarizes a portion of the ongoing effort to benchmark away-from-reactor criticality analysis methods using critical configurations from commercial pressurized water reactors (PWR). The analysis methodology utilized for all calculations in this report is based on the modules and data associated with the SCALE-4 code system. Each of the five volumes comprising this report provides an overview of the methodology applied. Subsequent volumes also describe in detail the approach taken in performing criticality calculations for these PWR configurations: Volume 2 describes criticality calculations for the Tennessee Valley Authority's Sequoyah Unit 2 reactor for Cycle 3; Volume 3 documents the analysis of Virginia Power's Surry Unit 1 reactor for the Cycle 2 core; Volume 4 documents the calculations performed based on GPU Nuclear Corporation's Three Mile Island Unit 1 Cycle 5 core; and, lastly, Volume 5 describes the analysis of Virginia Power's North Anna Unit 1 Cycle 5 core. Each of the reactor-specific volumes provides the details of calculations performed to determine the effective multiplication factor for each reactor core for one or more critical configurations using the SCALE-4 system; these results are summarized in this volume. Differences between the core designs and their possible impact on the criticality calculations are also discussed. Finally, results are presented for additional analyses performed to verify that solutions were sufficiently converged.

21761 (ORNL/TM–12294/V.2) **SCALE-4 analysis of pressurized water reactor critical configurations. Volume 2: Sequoyah Unit 2 Cycle 3.** Bowman, S.M.; Hermann, O.W.; Brady, M.C. Oak Ridge National Lab., TN (United States). Mar 1995. 229p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95010426. Source: OSTI; NTIS; INIS; GPO Dep.

The requirements of ANSI/ANS 8.1 specify that calculational methods for away-from-reactor criticality safety analyses be validated against experimental measurements. If credit for the negative reactivity of the depleted (or spent) fuel isotopics is desired, it is necessary to benchmark computational methods against spent fuel critical configurations. This report summarizes a portion of the ongoing effort to benchmark away-from-reactor criticality analysis methods using critical configurations from commercial pressurized-water reactors. The analysis methodology selected for all the calculations reported herein is based on the codes and data provided in the SCALE-4 code system. This volume of the report documents the SCALE system analysis of three reactor critical configurations for the Sequoyah Unit 2 Cycle 3. This unit and cycle were chosen because of the relevance in spent fuel benchmark applications: (1) the unit had a significantly long downtime of 2.7 years during the middle of cycle (MOC) 3, and (2) the core consisted entirely of burned fuel at the MOC restart. The first benchmark critical calculation was the MOC restart at hot, full-power (HFP) critical conditions. The other two benchmark critical calculations were the beginning-of-cycle (BOC) startup at both hot, zero-power (HZP) and HFP critical conditions. These latter calculations were used to check for consistency in the calculated results for different burnups and downtimes. The k_{eff} results were in the range of 1.00014 to 1.00259 with a standard deviation of less than 0.001.

21762 (ORNL/TM–12294/V.3) **SCALE-4 analysis of pressurized water reactor critical configurations. Volume 3: Surry Unit 1 Cycle 2.** Bowman, S.M.; Hermann, O.W. Oak Ridge National Lab., TN (United States). Mar 1995. 173p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95010428. Source: OSTI; NTIS; INIS; GPO Dep.

The requirements of ANSI/ANS 8.1 specify that calculational methods for away-from-reactor criticality safety analyses be validated against experimental measurements. If credit for the negative reactivity of the depleted (or spent) fuel isotopics is desired, it is necessary to benchmark computational methods against spent fuel critical configurations. This report summarizes a portion of the ongoing effort to benchmark away-from-reactor criticality analysis methods using selected critical configurations from commercial pressurized-water reactors. The analysis methodology selected for all the calculations in this report is based on the codes and data provided in the SCALE-4 code system. This volume of the report documents the SCALE system analysis of two reactor critical configurations for Surry Unit 1 Cycle 2. This unit and cycle were chosen for a previous analysis using a different methodology because detailed isotopics from multidimensional reactor calculations were available from the Virginia Power Company. These data permitted a direct comparison of criticality calculations using the utility-calculated isotopics, with those using, the isotopics generated by the SCALE-4 SAS2H sequence. These reactor critical benchmarks have been reanalyzed using the methodology described above. The two benchmark critical calculations were the beginning-of-cycle (BOC) startup at hot, zero-power (HZP) and an end-of-cycle (EOC) critical at hot, full-power (HFP) critical conditions. These calculations were used to check for consistency in the calculated results for different burnup, downtime, temperature, xenon, and boron conditions. The k_{eff} results were 1.0014 and 1.0113, respectively, with a standard deviation of 0.0005.

21763 (ORNL/TM–12294/V.4) **SCALE-4 analysis of pressurized water reactor critical configurations. Volume 4: Three Mile Island Unit 1 Cycle 5.** DeHart, M.D. Oak Ridge National Lab., TN (United States). Mar 1995. 111p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95010427. Source: OSTI; NTIS; INIS; GPO Dep.

The requirements of ANSI/ANS-8.1 specify that calculational methods for away-from-reactor criticality safety analyses be validated against experimental measurements. If credit is to be taken for the reduced reactivity of burned or spent fuel relative to its original fresh composition, it is necessary to benchmark computational methods used in determining such reactivity worth against spent fuel reactivity measurements. This report summarizes a portion of the ongoing effort to benchmark away-from-reactor criticality analysis methods using relevant and well-documented critical configurations from commercial pressurized water reactors. The analysis methodology utilized for all calculations in this report is based on the modules and data associated with the SCALE-4 code system. This volume of the report documents a reactor critical calculation for GPU Nuclear Corporation's Three Mile Island Unit 1 (TNU-1) during hot, zero-power startup testing for the beginning of cycle 5. This unit and cycle were selected because of their relevance in spent fuel benchmark applications: (1) cycle 5 startup occurred after an especially long downtime of 6.6 years; and (2) the core consisted primarily (75%) of burned fuel, with all fresh fuel loaded on the core outer periphery. A k_{eff} value of 0.9978 $\pm$ 0.0004 was obtained using two million neutron histories in the KENO V.a model. This result is close to the known critical k_{eff} of 1.0 for the actual core and is consistent with other mixed-oxide criticality benchmarks. Thus this method is shown to be valid for spent fuel applications in burnup credit analyses.

21764 (ORNL/TM–12816) **Enhanced code for the full space parameterization approach to solving underspecified systems of algebraic equations: Version 1.0.** Morgansen, K.A.; Pin, F.G. Oak Ridge National Lab., TN (United States). Mar 1995. 68p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95012544. Source: OSTI; NTIS; GPO Dep.

This paper describes an enhanced version of the code for the Full Space Parameterization (FSP) method that has recently been presented for determining optimized (and possibly constrained) solutions, x, to underspecified system's of algebraic equations b = Ax. The enhanced code uses the conditions necessary for linear independence of the m – n + 1 vectors forming the solution as a basis for an efficient search pattern to quickly find the full set of solution vectors. A discussion is made of the complications which may be present due to the particular combination of the matrix A and the vector b. The first part of the code implements the various methods needed to handle these particular cases before the solution vectors are calculated so that computation time may be decreased. The second portion of the code implements methods

which can be used to calculate the necessary solution vectors. The respective expressions of the full solution space, S, for the cases of the matrix A being full rank and rank deficient are given. Finally, examples of the resolution of particular cases are provided, and a sample application to the joint motion of a mobile manipulator for a given end-effector trajectory is presented.

21765 (RFP–4954) **Technology development: HEPA filter service life test plan.** Kirchner, K.N.; Cummings, K.G.; Leck, W.C.; Fretthold, J.K. Rocky Flats Environmental Technology Site, Golden, CO (United States). 31 May 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90RF62349. Order Number DE95013235. Source: OSTI; NTIS; GPO Dep.

Rocky Flats Environmental Technology Site (the Site) has approximately 10,000 High Efficiency Particulate Air (HEPA) Filters installed in a variety of filter plenums. These ventilation/filtration plenum systems are used to control the release of airborne particulate contaminates to the environment during normal operations and also during potential design-based accidents. The operational integrity of the HEPA filter plenums is essential to maintaining the margins of safety as required by building specific Final Safety Analysis Reports (FSARS) for protection of the public and environment. An Unreviewed Safety Question Determination (USQD), USDQ-RFP94.0615-ARS, was conducted in 1994 addressing the potential inadequacy of the safety envelope for Protected Area building HEPA plenums. While conducting this USQD, questions were raised concerning the maximum service life criteria for HEPA filters. Accident scenarios in existing FSARs identify conditions that could potentially cause plugging or damage of down stream HEPA filters as a result of impaction from failed filters. Additionally, available data indicates that HEPA filters experience structural degradation due to the effects of age. The Unresolved Safety Question (USQ) compensatory measures thus require testing and analysis of used HEPA filters in order to determine and implement service life criteria.

21766 (RFP–4999) **TRUPACT-II residue pipe payload container.** Geinitz, R. (Rocky Flats Environmental Technology Site, Golden, CO (United States)); Gregory, P. EG and G Rocky Flats, Inc., Golden, CO (United States). Rocky Flats Plant. [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90RF62349. (CONF-9506150–3: 2. annual Department of Energy defense programs packaging workshop, San Francisco, CA (United States), 12-15 Jun 1995). Order Number DE95012986. Source: OSTI; NTIS; INIS; GPO Dep.

This paper summarizes the project to develop, test and certify a new payload container for the TRUPACT-II, a Type B packaging for the shipment of transuranic waste. The new payload container will provide segregation of plutonium waste materials within the TRUPACT-II. This segregation of fissile contents will support a new criticality safety analysis that may allow an increase in the TRUPACT-II Pu-239 Fissile Gram Equivalent (FGE) limit from 325 grams to 2800 grams. The need for this project was brought about by the end of the Cold War and the resulting shift in value of plutonium residues from providing recoverable Defense Program material to being considered disposable waste. This paper will not cover many of the details of the project but will instead aim to provide a general picture of all the project activities.

21767 (SAND–94-2748C) **A dimensionless parameter model for arc welding processes.** Fuerschbach, P.W. Sandia National Labs., Albuquerque, NM (United States). [1994]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950682–1: 4. international conference on trends in welding research, Gatlinburg, TN (United States), 5-9 Jun 1995). Order Number DE95013861. Source: OSTI; NTIS; GPO Dep.

A dimensionless parameter model previously developed for $C0_2$ laser beam welding has been shown to be applicable to GTAW and PAW autogenous arc welding processes. The model facilitates estimates of weld size, power, and speed based on knowledge of the material's thermal properties. The dimensionless parameters can also be used to estimate the melting efficiency, which eases development of weld schedules with lower heat input to the weldment. The mathematical relationship between the dimensionless parameters in the model has been shown to be dependent on the heat flow geometry in the weldment.

21768 (SAND–95-0503C) **Application of three dimensional finite element analysis to electron beam welding of a high pressure compressor drum rotor.** Cowles, J.H. Jr. (Ingenium Technologies Group, Inc., Somers, CT (United States)); Blanford, M.; Giamei, A.F.; Bruskotter, M.J. Sandia National Labs., Albuquerque, NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9509118–1: Modeling of casting, welding and advanced solidification processes 7, London (United Kingdom), 10-15 Sep 1995). Order Number DE95008817. Source: OSTI; NTIS; GPO Dep.

Finite Element Analysis capability for application to welding has been developed and enhanced during a two year Cooperative Research and Development Agreement(CRADA) between Pratt & Whitney, United Technologies Research Center, and Sandia National Laboratories. Because of the nature of electron beam welding at Pratt & Whitney – set-up is time consuming, the parts to be welded are complicated, and experimentation is costly – finite element analysis has found many potential applications. The results of most interest in these analyses are the residual stress and final distortion of the component. The work has made use of the Sandia finite element codes JACQ3D, for thermal analysis, and JAS3D, for mechanical analysis. Both codes use an efficient, nonlinear conjugate gradient solution technique, which enables large problems to be solved on engineering workstations. This presentation describes several technical challenges that were overcome in the application of the Sandia codes to this class of problems. Stress and distortion results predicted for an electron beam weld of a PW4000 gas turbine engine drum rotor will also be discussed.

21769 (SAND–95-0722) **Learning to improve path planning performance.** Chen, Pang C. Sandia National Labs., Albuquerque, NM (United States). Apr 1995. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95012997. Source: OSTI; NTIS; INIS; GPO Dep.

In robotics, path planning refers to finding a short. collision-free path from an initial robot configuration to a desired configuratioin. It has to be fast to support real-time task-level robot programming. Unfortunately, current planning techniques are still too slow to be effective, as they often require several minutes, if not hours of computation. To remedy this situation, we present and analyze a learning algorithm that uses past experience to increase future performance. The algorithm relies on an existing path planner to provide solutions to difficult tasks. From these solutions, an evolving sparse network of useful robot configurations is learned to support faster planning. More generally, the algorithm provides a speedup-learning framework in which a slow but capable planner may be improved both cost-wise and capability-wise by a faster but less capable planner coupled with experience. The basic algorithm is suitable for stationary environments, and can be extended to accommodate changing environments with on-demand experience repair and object-attached experience abstraction. To analyze the algorithm, we characterize the situations in which the adaptive planner is useful, provide quantitative bounds to predict its behavior, and confirm our theoretical results with experiments in path planning of manipulators. Our algorithm and analysis are sufficiently, general that they may also be applied to other planning domains in which experience is useful.

21770 (SAND–95-0843) **System identification for robust control design.** Dohner, J.L. Sandia National Labs., Albuquerque, NM (United States). Apr 1995. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95012530. Source: OSTI; NTIS; GPO Dep.

System identification for the purpose of robust control design involves estimating a nominal model of a physical system and the uncertainty bounds of that nominal model via the use of experimentally measured input/output data. Although many algorithms have been developed to identify nominal models, little effort has been directed towards identifying uncertainty bounds. Therefore, in this document, a discussion of both nominal model identification and bounded output multiplicative uncertainty identification will be

presented. This document is divided into several sections. Background information relevant to system identification and control design will be presented. A derivation of eigensystem realization type algorithms will be presented. An algorithm will be developed for calculating the maximum singular value of output multiplicative uncertainty from measured data. An application will be given involving the identification of a complex system with aliased dynamics, feedback control, and exogenous noise disturbances. And, finally, a short discussion of results will be presented.

21771 (SAND–95-0969C) **Design and analysis of a high-performance shipping container for large payloads.** York, A.R. II; Slavin, A.M. Sandia National Labs., Albuquerque, NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9506150–2: 2. annual Department of Energy defense programs packaging workshop, San Francisco, CA (United States), 12-15 Jun 1995). Order Number DE95011879. Source: OSTI; NTIS; INIS; GPO Dep.

The packaging, designated the H1636A is a high-performing packageing for large payloads. The H1636A is 50 in. in diameter and 113 in. in length and weighs approximately 4600 lb when empty. The design objective was to meet 1996 proposed IAEA Type C criteria for air transport of large quantities of radioactive material (RAM). That is, the package should survive the standard Type B tests and more severe tests such as an impact onto an unyielding target at 280 ft/s and a one-hour jet fuel fire. The packaging consists of a large double-walled stainless steel outer drum filled with uniform density polyurethane foam. A stainless steel containment vessel (CV) with an inside diameter of 23 in. and a length of 78 in. carries the RAM. The CV has a nominal thickness of 0.375 in. and seals with two elastomeric 0-rings. The lid of the CV is joined to the body with a unique closure called a tape joint. The tape joint utilizes interlocking features preloaded with wedges and can withstand significant deformation.

21772 (SAND–95-1001C) **Risk from transportation of nuclear explosives and nuclear components by safe-secure trailer.** Copus, E.R.; Clauss, D.B.; Wilson, R.K. Sandia National Labs., Albuquerque, NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9506150–1: 2. annual Department of Energy defense programs packaging workshop, San Francisco, CA (United States), 12-15 Jun 1995). Order Number DE95011880. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy ships nuclear explosives, nuclear components and other special nuclear material (SNM) in support of Defense Programs activities. The primary mode of transportation is by public highways using the Armored Tractor/Safe-Secure Trailer (AT/SST), which was designed and equipped specifically for this mission. This paper will provide a description of the methodology and a summary of the results obtained in the Defense Programs Transportation Risk Assessment (DPTRA) study. The DPTRA study entailed a probabilistic transportation risk assessment conducted to assess the probability and consequences of inadvertent dispersal of radioactive materials arising from severe transportation accidents and from exposures associated with intrinsic radiation during incident-free transportation. The risk analysis incorporates statistics on the probabilities and severities of tractor semitrailer accidents; test data and engineering models to assess the response of the AT/SST and its cargo to the accident environment; and detailed route characterization to assess accident rates, probabilities of different meteorological conditions and population exposure. Uncertainties are considered in most of the input parameters using the Latin-Hypercube Sampling (LHS) technique. The results indicate the magnitude of the risk involved and the dominant contributors to risk.

21773 (SAND–95-1192C) **Empirical verification of fine-motoion planning theories.** Brost, R.C. (Sandia National Labs., Albuquerque, NM (United States)); Christiansen, A.D. Sandia National Labs., Albuquerque, NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9506196–1: ISER 95: 4. international symposium on experimental bobotics, Stanford, CA (United States), 30 Jun - 2 jul 1995). Order Number DE95013869. Source: OSTI; NTIS; GPO Dep.

Successful robot systems must employ actions that are robust in the face of task uncertainty. Toward this end, Lozano-Perez, Mason, and Taylor developed a model of manipulation tasks that explicitly considers task uncertainty. In this paper we study the utility of this model applied to real-world tasks. We report the results of two experiments that highlight the strengths and weaknesses of the LMT approach. The first experiment showed that the LMT formalism can successfully plan solutions for a complex real-world task. The second experiment showed a task that the formalism is fundamentally incapable of solving.

21774 (UCRL-ID–119334) **Light Emitting Diode (LED) fiducial system: Setup and operation.** Muelder, S.A. Lawrence Livermore National Lab., CA (United States). Jan 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95013289. Source: OSTI; NTIS; GPO Dep.

Streak cameras, either electronic or rotating mirror, are common diagnostic tools used to explore very fast phenomena. Often they are used to precisely time events or durations, and in most cases, it is important to have quality time marks on the film record. Many methods have been used to introduce time marks onto the film. Exploding bridge wires are frequently used, but they light up slowly and are difficult to read with consistent accuracy. It is also difficult to put more than a few bridge wires in the view of a camera slit, so there are only a few timing marks written to the film. In some cases the time scale on the film must be interpolated over long distances, creating a significant loss of accuracy. Interpolation is especially troublesome with those cameras that have a nonlinear sweep rate. Spark gaps located on the camera slit turn on a bit faster, but suffer from the same interpolation induced errors. A series of short duration laser pulses, accurately timed and introduced along the edges of the film, is a very fine solution. The problem with such a laser fiducial system is that the lasers are very expensive and difficult to maintain. There has been a need for many years for an inexpensive, very bright light source that can be repetitively pulsed accurately and with short duration. Various technologies have sufficiently developed over the past few years, allowing us to build a fiducial system based on light emitting diodes (LED) for the Cordin rotating mirror streak cameras.

21775 (UCRL-JC–115891-Rev.1) **Preliminary studies to determine the shelf life of HEPA filters. Revision 1.** Gilbert, H.; Fretthold, J.K.; Rainer, F.; Bergman, W.; Beason, D. Lawrence Livermore National Lab., CA (United States). Feb 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-940738–8-Rev.1: 23. DOE/NRC nuclear air cleaning and treatment conference, Buffalo, NY (United States), 25-28 Jul 1994). Order Number DE95011428. Source: OSTI; NTIS; INIS; GPO Dep.

We have completed a preliminary study using filter media tests and filter qualification tests to investigate the effect of shelf-life on HEPA filter performance. Our media studies showed that the tensile strength decreased with age, but the data were not sufficient to establish a shelf-life. Thermogravimetric analyses demonstrated that one manufacturer had media with low tensile strength due to insufficient binder. The filter qualification tests (heated air and overpressure) conducted on different aged filters showed that filter age is not the primary factor affecting filter performance; materials and the construction design have a greater effect. An unexpected finding of our study was that sub-standard HEPA filters have been installed in DOE facilities despite existing regulations and filter qualification tests. We found that the filter with low tensile strength failed the overpressure test. The same filter had passed the heated air test, but left the filter so structurally weak, it was prone to blow-out. We recommend that DOE initiate a filter qualification program to prevent this occurrence.

21776 (UCRL-JC–117059) **Robotic control architecture development for automated nuclear material handling systems.** Merrill, R.D.; Hurd, R.; Couture, S.; Wilhelmsen, K. Lawrence Livermore National Lab., CA (United States). Feb 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950232–35: 6. American Nuclear Society meeting on robotics and remote systems, Monterey, CA (United

States), 5-10 Feb 1995). Order Number DE95013426. Source: OSTI; NTIS; INIS; GPO Dep.

Lawrence Livermore National Laboratory (LLNL) is engaged in developing automated systems for handling materials for mixed waste treatment, nuclear pyrochemical processing, and weapon components disassembly. In support of these application areas there is an extensive robotic development program. This paper will describe the portion of this effort at LLNL devoted to control system architecture development, and review two applications currently being implemented which incorporate these technologies.

21777 (UCRL-JC–117143) **Thin film conductive polymer for microactuator and micromuscle applications.** Lee, A.P.; Hong, K.; Trevino, J.; Northrup, M.A. Lawrence Livermore National Lab., CA (United States). 14 Apr 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-941142–33: American Society of Mechanical Engineers' winter annual meeting, Chicago, IL (United States), 6-11 Nov 1994). Order Number DE95011744. Source: OSTI; NTIS; GPO Dep.

Conductive polymer/polyimide bimorphic microcantilevers have been actuated vertically (out-of-plane) upon the volumetric changes induced by electrochemical doping of the polymer. The microcantilevers that are 200-500 μm in length and 50-100 μm in width can be fully extended from a circularly-curled geometry, and thus generate more than 100 μm displacement. Dynamically the microcantilevers have been driven as fast as 1.2 Hz and the polymer was stable for over a week stored in air and light. Residual stresses in the polymer film is estimated to be as high as 254 MPa, and actuation stresses are as high as 50 MPa.

21778 (UCRL-JC–117457) **Modal analysis of PATHFINDER unmanned air vehicle.** Woehrle, T.G.; Costerus, B.W.; Lee, C.L. Lawrence Livermore National Lab., CA (United States). 19 Oct 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950240–5: International modal analysis conference, Nashville, TN (United States), 13-16 Feb 1995). Order Number DE95014127. Source: OSTI; NTIS; GPO Dep.

An experimental modal analysis was performed on PATHFINDER, a 450-lb, 100-ft wing span, flying-wing-design aircraft powered by solar/electric motors. The aircraft was softly suspended and then excited using random input from a long-stroke shaker. Modal data was taken from 92 measurement locations on the aircraft using newly designed, lightweight, tri-axial accelerometers. A conventional PC-based data acquisition system provided data handling. Modal parameters were calculated, and animated mode shapes were produced using SMS STARStruct™ Modal Analysis System software. The modal parameters will be used for validation of finite element models, optimum placement of onboard accelerometers during flight testing, and vibration isolation design of sensor platforms.

21779 (UCRL-JC–117980-Rev.1) **Analysis of interaction phenomena between liquid jets and materials. Revision 1.** Kang, S.W.; Reitter, T.; Carlson, G. Lawrence Livermore National Lab., CA (United States). Apr 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950853–1-Rev.1: ASME/JSME annual summer meeting of the Fluids Engineering conference, Hilton Head, SC (United States), 13-17 Aug 1995). Order Number DE95011519. Source: OSTI; NTIS; GPO Dep.

The interaction phenomena of high-velocity liquid jets impinging on a material surface have been investigated theoretically and experimentally to understand the physics of material removal by jet-machining processes. Experiments were performed to delineate conditions under which liquid jet impacts will cause mass removal, and to determine optimum jet-cutting conditions. Theoretical analyses have also been carried out to study the effects of multiple jet-droplet impacts on a target surface as a material deformation mechanism. The calculated target response and spallation behavior following droplet impacts and their physical implications are also discussed.

21780 (UCRL-JC–118757) **Diode laser absorption spectroscopy for process control: Sensor system design methodology.** Berzins, L.V.; Anklam, T.M.; Chambers, F.; Galanti, S.; Haynam, C.A.; Worden, E.F. Lawrence Livermore National Lab., CA (United States). Mar 1995. 25p. Sponsored by USDOE, Washington, DC (United States):Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950454–1: 22. international AVS conference on metallurgical coatings and thin films, San Diego, CA (United States), 24-28 Apr 1995). Order Number DE95011801. Source: OSTI; NTIS; INIS; GPO Dep.

A laser absorption spectroscopy (LAS) system has been developed at Lawrence Livermore National Laboratory (LLNL) for process control. LAS has proven itself to be an accurate and reliable method to monitor both density and composition. In this paper the important features and components of an industrial LAS diagnostic are described. Application of this approach to vaporization processes requires careful selection of the species and transitions to be monitored The relative vapor pressure, hyperfine structure, isotopic frequency shifts, and electronic temperature all effect the selection of a particular transition. In this paper we describe the methodology for choosing the optimal transition or transitions. Coevaporation of a titanium-niobium alloy is used to illustrate the methodology. In a related paper, T.M. Anklam et al describe the application of this diagnostic to monitoring and controlling composition in a physical vapor deposition process of industrial interest.

21781 (UCRL-JC–118897) **Automated system for handling tritiated mixed waste.** Dennison, D.K.; Merrill, R.D.; Reitz, T.C. Lawrence Livermore National Lab., CA (United States). Mar 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950877–7: 3. American Society for Mechanical Engineers biannual mixed waste symposium, Baltimore, MD (United States), 7-11 Aug 1995). Order Number DE95011842. Source: OSTI; NTIS; INIS; GPO Dep.

Lawrence Livermore National Laboratory (LLNL) is developing a semi system for handling, characterizing, processing, sorting, and repackaging hazardous wastes containing tritium. The system combines an IBM-developed gantry robot with a special glove box enclosure designed to protect operators and minimize the potential release of tritium to the atmosphere. All hazardous waste handling and processing will be performed remotely, using the robot in a teleoperational mode for one-of-a-kind functions and in an autonomous mode for repetitive operations. Initially, this system will be used in conjunction with a portable gas system designed to capture any gaseous-phase tritium released into the glove box. This paper presents the objectives of this development program, provides background related to LLNL's robotics and waste handling program, describes the major system components, outlines system operation, and discusses current status and plans.

21782 (UCRL-JC–119862) **Rigid bodies for metal forming analysis with NIKE3D.** Maker, B.N. Lawrence Livermore National Lab., CA (United States). 25 Jan 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9506144–4: 5. international conference on numerical methods in industrial forming processes (NUMIFORM), Ithaca, NY (United States), 18-21 Jun 1995). Order Number DE95011740. Source: OSTI; NTIS; GPO Dep.

Perhaps the most common approximation in engineering is that, relative to its neighbors, a system component is structurally rigid. This paper presents a development of the rigid assumption for use in nonlinear, implicit finite element codes. In this method, computational economy is gained by condensing the size of the associated linear system of equations, eliminating the processing of rigid elements, and reducing the overall nonlinearity of the problem.

21783 (UCRL-JC–120410) **Modeling of profile effects for the LLNL Large Area Inductively Coupled Plasma Source.** Vitello, P. (and others); Parker, G.J.; Tishchenko, N. Lawrence Livermore National Lab., CA (United States). May 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950875–3: International symposium on plasma chemistry, Minneapolis, MN (United States), 21-25 Aug 1995). Order Number DE95013322. Source: OSTI; NTIS; GPO Dep.

Inductively coupled plasma (ICP) sources are one of the most important high density plasma configurations developed in recent

years. Next generation technology requires plasma processing systems with high uniformity over very large areas. The authors present here a comparison between computer modeling and experimental results from the LLNL Large Area ICP Source. The LLNL experiment has a 30 inches diameter and is designed to study 400mm. processing. Computer simulations using the fluid code, INDUCT94, are used to explain variations in the plasma density profile measurements as a function of inductive power and gas pressure. Trends in density profile versus pressure and power found in the simulation match those found in the experiment. Uniformity of the order of several percent was found to be possible over a 400mm diameter area.

21784 (UCRL-JC–120508) **Oxide vapor distribution from a high-frequency sweep e-beam system.** Chow, R.; Tassano, P.L.; Tsujimoto, N. Lawrence Livermore National Lab., CA (United States). Mar 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9504155–1: 38. annual technical conference of the Society of Vacuum Coaters, Chicago, IL (United States), 2-7 Apr 1995). Order Number DE95011446. Source: OSTI; NTIS; GPO Dep.

Oxide vapor distributions have been determined as a function of operating parameters of a high frequency sweep e-beam source combined with a programmable sweep controller. We will show which parameters are significant, the parameters that yield the broadest oxide deposition distribution, and the procedure used to arrive at these conclusions. A design-of-experimental strategy was used with five operating parameters: evaporation rate, sweep speed, sweep pattern (pre-programmed), phase speed (azimuthal rotation of the pattern), profile (dwell time as a function of radial position). A design was chosen that would show which of the parameters and parameter pairs have a statistically significant effect on the vapor distribution. Witness flats were placed symmetrically across a 25 inches diameter platen. The stationary platen was centered 24 inches above the e-gun crucible. An oxide material was evaporated under 27 different conditions. Thickness measurements were made with a stylus profilometer. The information will enable users of the high frequency e-gun systems to optimally locate the source in a vacuum system and understand which parameters have a major effect on the vapor distribution.

21785 (UCRL-JC–120583) **Tension in the tie-down chains of a shipping container for hazardous material.** Lo, T.Y. Lawrence Livermore National Lab., CA (United States). 17 Mar 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950740–35: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95011436. Source: OSTI; NTIS; INIS; GPO Dep.

Chains are frequently used to tie the shipping containers of hazardous material to a truck bed. The tie-down system is nonlinear when the container is subjected to a triaxial force during transit. It is nonlinear because chains cannot carry compressive force, and the base of the container may partially lift off from the truck bed. A method was developed to calculate the amount of tension in the chains. This methodology includes three assumptions: (1) No friction exists between the container and the truck bed; (2) The container and the truck bed are rigid; and (3) All chains are properly tightened (i.e., no slacks) during preparation for shipment. The methodology employs an iterative process of a linear tie-down system. This linear system is derived from the nonlinear system with two additional assumptions: (a) All chains can carry compression as well as tension; and (b) There is a point contact between the container and the truck bed. This linear system has a closed-form solution. After the first solution of the linear system is obtained, the unreasonable, or physically impossible, rotational degree of freedom of the container and the chains with compressive force are eliminated in the follow-up iterative calculations using the same linear system. Unreasonable rotation is detected when the results indicate a rotation of the container into the truck bed. Zero rotational value is assigned to this degree of freedom in the follow-up iterations. For chains under compression, the chain length is replaced with a fictitiously large value because a long chain carries essentially no load. This process usually needs only two or three iterations and can easily be carried out in a spread sheet using such programs as Microsoft Excel or LOTUS 123.

21786 (WHC-SD-CP-TI–171) **Flowsheet for shear/leach processing of N Reactor fuel at PUREX.** Enghusen, M.B. Westinghouse Hanford Co., Richland, WA (United States). 13 Apr 1995. 81p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011573. Source: OSTI; NTIS; INIS; GPO Dep.

This document was originally prepared to support the restart of the PUREX plant using a new Shear/Leach head end process. However, the PUREX facility was shutdown and processing of the remaining N Reactor fuel is no longer considered an alternative for fuel disposition. This document is being issued for reference only to document the activities which were investigated to incorporate the shear/leach process in the PUREX plant.

21787 (WHC-SD-TP-RPT–020) **Final evaluation report for a U.S. Department of Transportation Specification 7A Type A Radioactive Material Packaging, Lockheed Idaho Technologies Company (LITCO), Mark III Concrete Container, Docket 92-33-7A.** Kelly, D.L. Westinghouse Hanford Co., Richland, WA (United States). 24 Mar 1995. 101p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010563. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the U.S. Department of Transportation Specification 7A Type A (DOT-7A) compliance test results of the Mark III Concrete Container. The authorized configuration consists of the Mark III Concrete Container with a two-piece, welded, polyethylene liner (lid and body), polyethylene foam gasket, and six coil bolts and washers. A vent plug exists in the lid of the container. Two plugs are located on the side of the container body (lower portion), and allow the access to a ball valve. Two plugs are located underneath the bottom of the container body, near these side plugs. To drain the box, the bottom plugs need to be removed. The side plugs are then removed, allowing access to the ball valve. When the ball valve is opened, drainage occurs through the bottom drain area. After drainage, no residual liquid is permitted. The packaging may be used with or without the top wooden impact limiter. This packaging was evaluated and tested in August and October 1994. The packaging configurations described in this report are designed to ship Type A quantities of solid radioactive materials, Form No. 1, Form No. 2, and Form No. 3.

21788 (WHC-SP–0856-Rev.2) **Maintenance implementation plan for T Plant. Revision 2.** Ayers, W.S. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013579. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a Maintenance Implementation Plan (MIP) for the T Plant Facility complex located in the 200 West Area of the Hanford Reservation in Washington state. This plan has been developed to provide a disciplined approach to maintenance functions and to describe how the T Plant facility will implement and comply with the regulations according to US DOE order 4330.4B, entitled Maintenance Management Program, Chapter 2.0 "Nuclear Facilities". Physical structures, systems, processes, as well as all associated equipment specifically assigned to these groups are included in the MIP.

21789 (WSRC-MS–95-0116) **Normal Condition on Transport Thermal Analysis and Testing of a Type B Drum Package.** Jerrell, J.W.; van Alstine, M.N.; Gromada, R.J. Westinghouse Savannah River Co., Aiken, SC (United States). 21 Mar 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9506194–1: 1995 PVP conference, Livermore, CA (United States), 12-14 Jun 1995). Order Number DE95060132. Source: OSTI; NTIS; INIS; GPO Dep.

Increasing the content limits of radioactive material packagings can save money and increase transportation safety by decreasing the total number of shipments required to transport large quantities of material. The contents of drum packages can be limited by unacceptable containment vessel pressures and temperatures due to the thermal properties of the insulation. The purpose of this work is

to understand and predict the effects of insulation properties on containment system performance.

21790 (WSRC-MS–95-0197) **Heat Transfer in Cane Fiberboard Exposed to Hypothetical Accident Conditions.** Gromada, R.J. Westinghouse Savannah River Co., Aiken, SC (United States). 25 May 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9506150–4: 2. annual Department of Energy defense programs packaging workshop, San Francisco, CA (United States), 12-15 Jun 1995). Order Number DE95060148. Source: OSTI; NTIS; GPO Dep.

Radioactive material packages containing fiberboard insulation have been subjected to Hypothetical Accident Condition (HAC) thermal tests for many years. Historically, the packages' thermal performance has always been difficult to grasp. A package designer needs to understand the effects of temperature and pyrolysis on the rate of heat transfer and performance. This paper describes in detail the one-dimensional HAC thermal tests performed on fiberboard to understand the effects of pyrolysis, its char and its gas products. The tests were conducted by the Packaging and Transportation Group at the Savannah River Site (SRS). Test fixtures were assembled at SRS and thermal testing conducted in the Radiant Heat Facility at the Sandia National Laboratories. Descriptions of the test fixtures are provided, as well as the time dependent temperature profiles. In addition, lessons learned are discussed.

21791 (WSRC-TR–94-0402) **Burst Test Qualification Analysis of DWPF Canister-Plug Weld.** Gupta, N.K.; Gong, Chung. Westinghouse Savannah River Co., Aiken, SC (United States). Feb 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060133. Source: OSTI; NTIS; INIS; GPO Dep.

The DWPF canister closure system uses resistance welding for sealing the canister nozzle and plug to ensure leak tightness. The welding group at SRTC is using the burst test to qualify this seal weld in lieu of the shear test in ASME B&PV Code, Section IX, paragraph QW-196. The burst test is considered simpler and more appropriate than the shear test for this application. Although the geometry, loading and boundary conditions are quite different in the two tests, structural analyses show similarity in the failure mode of the shear test in paragraph QW-196 and the burst test on the DWPF canister nozzle Non-linear structural analyses are performed using finite element techniques to study the failure mode of the two tests. Actual test geometry and realistic stress strain data for the 304L stainless steel and the weld material are used in the analyses. The finite element models are loaded until failure strains are reached. The failure modes in both tests are shear at the failure points. Based on these observations, it is concluded that the use of a burst test in lieu of the shear test for qualifying the canister-plug weld is acceptable. The burst test analysis for the canister-plug also yields the burst pressures which compare favorably with the actual pressure found during burst tests. Thus, the analysis also provides an estimate of the safety margins in the design of these vessels.

21792 (WSRC-TR–94-0606) **Inductive Double-Contingency Analysis of UO2 Powder Bulk Blending Operations at a Commercial Fuel Plant (U).** Skiles, S. K. (Westinghouse Savannah River Company, Aiken, SC (United States)). Westinghouse Savannah River Co., Aiken, SC (United States). 22 Dec 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9509100–1: 5. international conference on nuclear criticality safety, Albuquerque, NM (United States), 17-22 Sep 1995). Order Number DE95060144. Source: OSTI; NTIS; INIS; GPO Dep.

An inductive double-contingency analysis (DCA) method developed by the criticality safety function at the Savannah River Site, was applied in Criticality Safety Evaluations (CSEs) of five major plant process systems at the Westinghouse Electric Corporation's Commercial Nuclear Fuel Manufacturing Plant in Columbia, South Carolina (WEC-Cola.). The method emphasizes a thorough evaluation of the controls intended to provide barriers against criticality for postulated initiating events, and has been demonstrated effective at identifying common mode failure potential and interdependence among multiple controls. A description of the method and an example of its application is provided.

21793 (WSRC-TR–95-0157) **Shielded Cells D&D and Dismantlement System Requirements.** Witherspoon, R.L. Westinghouse Savannah River Co., Aiken, SC (United States). 27 Mar 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060139. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes the basis for the development of the System for Highly Radioactive Equipment Dismantlement or SHRED. It is the result of a thorough investigation into current and past dismantlement practices at shielded cell facilities around the DOE complex. This information has been used to formulate the development requirements for the SHRED.

21794 (ANL/IFR/CP–85915) **Quantitative characterizations of phasic structure developments by local measurement methods in two-phase flow.** Eberle, C.S. (Argonne National Lab., IL (United States)); Leung, W.H.; Wu, Q.; Ueno, T.; Ishii, M. Argonne National Lab., IL (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950445–3: 2. international conference on multiphase flow, Kyoto (Japan), 3-7 Apr 1995). Order Number DE95012920. Source: OSTI; NTIS; GPO Dep.

An experimental study on the internal structure an a out in a 25.4 mm ID pipe. The local void fraction and interfacial area concentration were measured by a double-sensor probe. The flow structure development was visualized by measuring the radial distribution of these two parameters at three axial, locations (L/D = 12, 62, and 112). A more detailed study on the fully developed flow structure was conducted at L/D = 120. The interfacial structure were measured by the double- and four-sensor probes. A bubbly to-=slug transition region was defined according to the local data.The area-averaged void fraction measurements were given by a gamma densitometer. Other parameters such as the Taylor bubble film thickness, bubble length and slug unit length in slug flow were measured by a film robe. The redundant measurements were made to calibrate the local probe measurements. The quantitative representation of the phasic structure can then be used for modeling.

21795 (DLR-FB–94-22) **Analysis and modeling of small-scale turbulence in the near-wall region of turbulent shear flows.** Jimenez-Haertel, C. (Deutsche Forschungsanstalt fuer Luft- und Raumfahrt e.V. (DLR), Goettingen (Germany). Inst. fuer Stroemungsmechanik). Deutsche Forschungsanstalt fuer Luft- und Raumfahrt e.V. (DLR), Koeln (Germany). Abt. Operative Planung; Technische Univ. Muenchen (Germany). Fakultaet fuer Maschinenwesen. 1994. 145p. (In German). Order Number DE95779814. Source: OSTI; NTIS (US Sales Only).

The physical characteristics of small-scale turbulence and its energetic interaction with large-scale turbulence are analyzed in flow fields near solid walls. The analysis is based on results obtained from direct numerical simulations of turbulent channel and pipe flow. A key observation is that within the buffer-layer a reverse cascade of turbulent kinetic energy exists in the mean. Here large-scale turbulence structures are fed by nonlinear interactions with small-scale turbulence. The application of the VISA conditional sampling technique reveals that the reverse cascade of energy is closely related to the occurrence of coherent motions in the near-wall flow. It is shown that subgrid-scale models, currently applied in large-eddy simulations, are not capable of accounting for this important phenomenon. The implications of this deficiency for the large-eddy simulation of near-wall turbulence are examined by analyzing results from a series of large-eddy simulations of turbulent channel flow at various Reynolds numbers. (orig.)

21796 (ETDE-DE–125) **Investigation of heat transfer during evaporation and condensation of new, environmentally harmless refrigerants on tube bundles.** Hage, M.; Kriegsmann, A. Wieland-Werke AG, Ulm (Germany). Mar 1993. 27p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie,

Bonn (Germany). Foerderkennzeichen BMFT 01ZH89E1. Order Number DE95780379. Source: OSTI; NTIS (US Sales Only).

In the scope of the 4 th workshop "cogeneration systems" in Berlin a report was given on the present state of cogeneration system technology and application. In addition to questions of financing and organizational-technical aspects, a series of applications was presented. Subject: support, financing through banks, operator models, procedures for approval, conditions for connection regarding gas and electric power, energy policy, cogeneration systems in Berlin, double electric power yield for natural gas relief, electric power from biogas, nuclear power plants, energy supply of a hospital with cogeneration systems. All 12 lectures have been recorded as separate entries in this database. (BWI). 3 refs., 2 tabs., 14 figs.

21797 (ETDE-DE–134) **Simulation model of cooling load for non-steady state behaviour of cooling and freezing processes.** Nowotnick, M. Institut fuer Luft- und Kaeltetechnik GmbH, Dresden (Germany). 24 Apr 1991. 23p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 30E200904. (KB–24/1264/91). Order Number DE95786089. Source: OSTI; NTIS (US Sales Only).

In the context of a wide research programme, a universal cooling load model is to be developed, by which the time course of cooling and freezing processes can be calculated. This programme contains the calculation of one-dimensional non-steady state thermal conduction in a flat plate with phase change and the calculation of drying losses when cooling and freezing halves of pigs. It is intended to generalise the equations for the non-steady state cooling load model and to couple them with the TLK refrigeration plant model. The first stage of working contains the production of a program which can run, whose results are compared with those of further steps of processing. (BWI)

21798 (ETDE-DE–136) **The dynamic behaviour of refrigeration technique systems (basic research). Final report.** Nowotnick, M. Institut fuer Luft- und Kaeltetechnik GmbH, Dresden (Germany). 24 Apr 1991. 6p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 30E2009. (KB–24/1265/91). Order Number DE95786090. Source: OSTI; NTIS (US Sales Only).

In the context of this work, a suitable cooling load model is to be developed, by which the time course of temperature and phase changes in the material being cooled can be simulated. The present part of the report deals with aspects of basic research. In this context, it deals with the pre-conditions, planning and course, the scientific/technical state, the result and the report on its success. (BWI)

21799 (FEI–2378) **Numerical investigation of flows and heat exchange in tubes with use of (k-ε) turbulence model.** Veremeev, A.A.; Leonchuk, M.P. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1994. 31p. (In Russian). Order Number DE95633491. Source: OSTI; NTIS (US Sales Only); INIS.

A numerical method and program to calculate velocity and temperature distributions in straight channels of arbitrary cross section were developed and tested. They are designed for the numerical investigations of operating conditions of heat exchanging elements of nuclear power plants. The Reynolds-averaged three-dimensional thermal-hydraulic equations and the equations of (k-ε)-model of turbulence are solved by the finite difference technique using orthogonal curvilinear grid. Test calculations were performed for stabilized and non-stabilized flow and heat transfer in round pipes at a wide range of Reynolds numbers for different Prandtl number liquids. Results are well compared with experimental data and empirical correlations. 30 refs.; 18 figs.

21800 (INIS-JP–028, pp. 40-42) **A behavior of helium gas bubble in NaK-78 pool with a magnetic field.** Takahashi, Osamu (Kyoto Univ. (Japan). Faculty of Engineering); Inaba, Takeo; Kohno, Masuchika; Kawara, Zensaku; Serizawa, Akimi. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University.* Order Number DE95709897. Source: OSTI; NTIS; INIS.

In this study we observed a helium-liquid metal (NaK-78) two-phase flow in a pool with and without magnetic field. We measured velocity and drag coefficient of rising bubbles from video images taken by X-ray method. (author).

21801 (INIS-JP–028, pp. 43-44) **Development of a new ultrasonic technique for measuring dynamic behavior of liquid film flow.** Nagane, Kohei (Kyoto Univ. (Japan). Faculty of Engineering); Serizawa, Akimi; Takahashi, Osamu; Kawara, Zensaku. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University.* Order Number DE95709897. Source: OSTI; NTIS; INIS.

This report is concerned with developing a new technique to measure dynamics behaviors of liquid film flowing over a plate or in a channel based on ultrasonic echo method. This new method enables us to obtain one image every 10 msec. (author).

21802 (INIS-JP–028, pp. 45-47) **Dependence of void distribution in bubbly flow on rod arrays inclination angle.** Huda, K. (Kyoto Univ. (Japan). Faculty of Engineering); Serizawa, Akimi; Takahashi, Osamu; Kawara, Zensaku. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University.* Order Number DE95709897. Source: OSTI; NTIS; INIS.

Observations of void distribution were performed to study the characteristics of bubbly flow through inclined rod arrays. Air bubbles were flowing vertically upward through rod arrays for a range of flow rates from 0.01 l/min to 1.5 l/min. The inclination angles of the rods relative to the horizontal were 30deg, 45deg, 60deg and 75deg. The experiments reveal a strong dependence of the inclination angles of the rods. (author).

21803 (INIS-JP–028, pp. 48-50) **Effect of ultrasonic waves on boiling heat transfer.** Mukai, Masakatsu (Kyoto Univ. (Japan). Faculty of Engineering); Serizawa, Akimi; Takahashi, Osamu; Kawara, Zensaku; Mishima, Kaichirou. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University.* Order Number DE95709897. Source: OSTI; NTIS; INIS.

This report focuses on a better understanding of the physical phenomenon related to the enhancement of boiling and non-boiling heat transfer by applying ultrasonic waves. Experimental results obtained both in a pool of water and in a vertically upward water flow proved clearly that macroscopic acoustic stream induced by ultrasonics is a major contribution to heat transfer augmentation. (author).

21804 (INIS-JP–028, pp. 51-53) **Analyses of liquid-gas two-phase flow in fermentation tanks.** Toi, Takashi (Kyoto Univ. (Japan). Faculty of Engineering); Serizawa, Akimi; Takahashi, Osamu; Kawara, Zensaku; Gofuku, Akio; Kataoka, Isao. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University.* Order Number DE95709897. Source: OSTI; NTIS; INIS.

The understanding of two-phase flow is one of the important problems for both design and safety analyses of various engineering systems. For example, the flow conditions in beer fermentation tanks have an influence on the quality of production and productivity of tank. In this study, a two-dimensional numerical calculation code based on the one-pressure two-fluid model is developed to understand the circulation structure of low quality liquid-gas two-phase flows induced by bubble plume in a tank. (author).

21805 (INIS-JP–029, pp. 34-37) **Phase distribution of air-water two-phase flow across inclined tube bundle.** Huda, K. (Kyoto Univ. (Japan). Faculty of Engineering); Serizawa, Akimi; Takahashi, Osamu; Kawara, Zensaku; Kataoka, Isao. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

In order to clarify the mechanisms governing the two-phase external flow structure across the inverted U-tube bundle in a PWR steam generator, measurements of local void fraction and bubble impaction rate have been conducted in a vertical air-water flow across inclined tube bundles. The in-line and staggered 9x6 tube bundles with transverse pitch-to-diameter ratio 2.0 and longitudinal ratio 2.5 were used in the present work. It has been drawn from the present work that the phase distribution in inclined tube bundle is strongly affected by both mass velocity and the inclination angle of the tube bundle. The effect of inclination angle becomes more remarkable at lower mass velocity. (author).

21806 (INIS-JP–029, pp. 38-41) **Measuring method of liquid flow behavior using visualization.** Serizawa, Akimi (Kyoto Univ. (Japan). Faculty of Engineering); Kamei, Takashi; Takahashi, Osamu; Kawara, Zensaku. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

It is important for the safety of nuclear reactor to understand the behavior of gas-liquid two-phase flow. For that analysis, we have to understand its time and spatial dependence. But most of the measuring methods applied to two-phase flow experiments are not enough for this purpose, because they consider the time averaged value, and they are put on the local position in test sections. Standing on such a point of view, we have been developing a measuring method using fluorescence. And from those pictures gotten by video camera, after processed by computer, we measure liquid film thickness. (author).

21807 (INIS-JP–029, pp. 42-44) **Visualization of physical informations derived from numerical calculation.** Kodama, Shigeo (Kyoto Univ. (Japan). Faculty of Engineering); Serizawa, Akimi; Takahashi, Osamu; Kawara, Zensaku. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

It is important for the field of flow dynamics to visualize a flow in some way. In this study, by making use of the result of numerical calculation based on the one-pressure two-fluid model, visualization of some physical informations are developed to understand the characteristics of liquid-gas two phase flow induced by bubble plume in a tank. (author).

21808 (LA–12671-MS) **Two-point correlation equations for variable density turbulence.** Clark, T.T. (Los Alamos National Lab., NM (United States)); Spitz, P.B. Los Alamos National Lab., NM (United States). Jun 1995. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95011855. Source: OSTI; NTIS; GPO Dep.

A complete set of two-point correlation equations for variable-density turbulence is derived to consistent order in mass-weighted variables (Favre averaging). The derivation is based on a two-point generalization of the Reynolds stress tensor. The equations are transformed with respect to the separation between the two points to Fourier space. The correlation equations, as well as the Fourier-transformed equations, provide insights that are unavailable in the one-point equations. The derivation of spectral closures is significantly more complicated than that of constant-density closures or one-point variable-density closures due to the complex nature of isotropic scalar-vector correlation functions for nonsolenoidal fields. Several necessary constraints for the correlation functions are presented. In addition, a simple spectral model that satisfies these constraints is presented for illustrative purposes, and a discussion of the two-point correlations and their relationship to the corresponding correlations arising in one-point derivations is provided.

21809 (LA-SUB–94-168) **Computational and experimental studies of hydrodynamic instabilities and turbulent mixing: Review of VNIIEF efforts. Summary report.** Andronov, V.A. (Russian Federal Nuclear Center (Russian Federation)); Zhidov, I.G.; Meskov, E.E.; Nevmerzhitskii, N.V.; Nikiforov, V.V.; Razin, A.N.; Rogatchev, V.G.; Tolshmyakov, A.I.; Yanilkin, Y.V. Los Alamos National Lab., NM (United States); Russian Federal Nuclear Center (Russian Federation). 1994. 213p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95011637. Source: OSTI; NTIS; GPO Dep.

The report presents the basic results of some calculations, theoretical and experimental efforts in the study of Rayleigh-Taylor, Kelvin-Helmholtz, Richtmyer-Meshkov instabilities and the turbulent mixing which is caused by their evolution. Since the late forties the VNIIEF has been conducting these investigations. This report is based on the data which were published in different times in Russian and foreign journals. The first part of the report deals with calculations an theoretical techniques for the description of hydrodynamic instabilities applied currently, as well as with the results of several individual problems and their comparison with the experiment. These methods can be divided into two types: direct numerical simulation methods and phenomenological methods. The first type includes the regular 2D and 3D gasdynamical techniques as well as the techniques based on small perturbation approximation and on incompressible liquid approximation. The second type comprises the techniques based on various phenomenological turbulence models. The second part of the report describes the experimental methods and cites the experimental results of Rayleigh-Taylor and Richtmyer-Meskov instability studies as well as of turbulent mixing. The applied methods were based on thin-film gaseous models, on jelly models and liquid layer models. The research was done for plane and cylindrical geometries. As drivers, the shock tubes of different designs were used as well as gaseous explosive mixtures, compressed air and electric wire explosions. The experimental results were applied in calculational-theoretical technique calibrations. The authors did not aim at covering all VNIIEF research done in this field of science. To a great extent the choice of the material depended on the personal contribution of the author in these studies.

21810 (LA-UR–95-1145) **A comparison of interface tracking methods.** Kothe, D.B.; Rider, W.J. Los Alamos National Lab., NM (United States). 27 Mar 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950634–1: 26. American Institute of Aeronautics and Astronautics (AIAA) computational fluid dynamics conference, San Diego, CA (United States), 19-22 Jun 1995). Order Number DE95009481. Source: OSTI; NTIS; INIS; GPO Dep.

In this Paper we provide a direct comparison of several important algorithms designed to track fluid interfaces. In the process we propose improved criteria by which these methods are to be judged. We compare and contrast the behavior of the following interface tracking methods: high order monotone capturing schemes, level set methods, volume-of-fluid (VOF) methods, and particle-based (particle-in-cell, or PIC) methods. We compare these methods by first applying a set of standard test problems, then by applying a new set of enhanced problems designed to expose the limitations and weaknesses of each method. We find that the properties of these methods are not adequately assessed until they axe tested with flows having spatial and temporal vorticity gradients. Our results indicate that the particle-based methods are easily the most accurate of those tested. Their practical use, however, is often hampered by their memory and CPU requirements. Particle-based methods employing particles only along interfaces also have difficulty dealing with gross topology changes. Full PIC methods, on the other hand, do not in general have topology restrictions. Following the particle-based methods are VOF volume tracking methods, which are reasonably accurate, physically based, robust, low in cost, and relatively easy to implement. Recent enhancements to the VOF methods using multidimensional interface reconstruction and improved advection provide excellent results on a wide range of test problems.

21811 (LBL–36944) **On the development of MP-TOUGH2.** Oldenburg, C.M.; Hinkins, R.L.; Moridis, G.J.; Pruess, K. Lawrence Berkeley Lab., CA (United States). Feb 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9503116–8: 1995 TOUGH workshop, Berkeley, CA (United States), 20-22 Mar 1995). Order Number DE95012328. Source: OSTI; NTIS; GPO Dep.

The authors are developing MP-TOUGH2 for exploiting massively parallel computers. The goals of this effort are to (1) create

a data-parallel subsurface transport code for solving larger problems than currently practical on workstations, (2) write portable code that can take advantage of scalability to run on machines with more processors, and (3) minimize the necessity for additional validation and verification of the resulting code. The initial strategy they have followed is to focus on optimizing the generic and time-consuming task of linear equation solution while leaving the bulk of TOUGH2 unmodified. In so doing, they have implemented a massively parallel direct solver (MPDS) that takes advantage of the banded structure of TOUGH2 Jacobian matrices. The authors have compared timings of the iterative conjugate gradient solvers DSLUBC, DSLUCS, and DSLUGM written in Fortran77 for the front end with the MPDS which uses the data parallel unit. The MPDS shows good performance relative to the iterative conjugate gradient solvers on the free-convection test problem. The robust direct solution provided by MPDS can be used to (1) check on the veracity of a given iterative conjugate gradient solution, or (2) be used on certain problems where iterative solvers fail to converge. The test problem used in this study is the Elder pure thermal convection problem. For generality, the authors use the TOUGH2 equation of state module EOS3 for water, air, and heat, although this particular problem is a single-phase flow problem.

21812 (LBL–37066) **A new set of direct and iterative solvers for the TOUGH2 family of codes.** Moridis, G.J. (Lawrence Berkeley Lab., CA (United States). Earth Sciences Div.). Lawrence Berkeley Lab., CA (United States). Apr 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9503116–10: 1995 TOUGH workshop, Berkeley, CA (United States), 20-22 Mar 1995). Order Number DE95012332. Source: OSTI; NTIS; INIS; GPO Dep.

Two new solvers are discussed. LUBAND, the first routine is a direct solver for banded systems and is based on a LU decomposition with partial pivoting and row interchange. BCGSTB, the second routine, is a Preconditioned Conjugate Gradient (PCG) solver with improved speed and convergence characteristics. Bandwidth minimization and gridblock ordering schemes are also introduced into TOUGH2 to improve speed and accuracy. TOUGH2 simulates fluid and heat flows in permeable media and is used for the evaluation of WIPP and TEVES (Thermal Enhanced Vapor Extraction System) that will be used to extract solvents from the Chemical Waste Landfill at Sandia National Laboratories.

21813 (LUTMDN-TMVK–3171) **Effects of cycling frequency on heat transfer in domestic gas boilers.** Naeslund, M. Lund Univ. (Sweden). Dept. of Heat and Power Engineering. Mar 1995. 27p. Order Number DE95779299. Source: OSTI; NTIS.

A heat transfer model for domestic gas boilers in transient operation is derived in the report. Three heat capacities are used in the model, the heat exchanger, the radiator water and the flue gases. Steady state performance is used to characterize heat exchanger areas and heat transfer coefficients. Calculations are made in order to evaluate the effects of changes in the burner operating frequency. Comparisons with measurements show good agreement and explanations to measured boiler characteristics are given. 5 refs, 14 figs, 6 tabs

21814 (LUTMDN-TMVK–7018) **Laser doppler measurements of turbulent swirling flows in a circular tube with a sudden expansion followed by a sudden contraction.** Wessman, M. Lund Univ. (Sweden). Dept. of Heat and Power Engineering. Feb 1995. 47p. Order Number DE95779303. Source: OSTI; NTIS.

Two component Laser Doppler Velocimetry measurements have been made in a turbulent flow field in an axisymmetric confined sudden expansion, followed by a contraction. Measurements were made using different inlet swirl numbers and Reynolds numbers. One flow field with reduced distance between the expansion and the contraction was also studied. The investigated geometry can be seen as a simplified gas turbine combustor, where the swirl is introduced to increase the mixing rate and stabilize the flame. When the swirl is introduced, the turbulent energy increases, and when the swirl number reaches a value between 0.33 and 0.43 a central recirculation zone occurs, which increases with increasing swirl number. For higher swirl numbers the central recirculation zone has a hollow core shape. To characterize the influence of the periodic disturbances that are associated with swirling flows, an integration of an estimated power spectrum around the frequency of the periodic disturbances was made. It was found that as much as 50% of the turbulent kinetic energy is associated with the periodic disturbances. The measurements include mean velocities and Reynolds stresses, which provide a data base suitable for model validation. 36 refs, 47 figs, 7 tabs

21815 (LUTMDN-TMVK–7019) **Simulation of flowmeter installation effects.** Holm, M. Lund Univ. (Sweden). Dept. of Heat and Power Engineering. Mar 1995. 33p. Order Number DE95779304. Source: OSTI; NTIS.

Determination of the calibration factor for an ultrasonic flow meter subjected to an installation effect has been made with the aid of Computational Fluid Dynamics. Validation of the method has been done by comparing computed and measured calibration factors for a 100 diameter straight tube, a single elbow and a double elbow out of plane bend. The Reynolds number was varied from 2,000 to 12,000 for all cases and extended to 100,000 for the 100 diameter straight tube. The agreement between simulated and measured data are within +/- 1 per cent for the tested cases. Above Reynolds number 30,000 the agreement are well below 1 per cent error. 51 refs, 15 figs, 8 tabs

21816 (SAND–94-2471C) **Computational fluid dynamic studies of a solid and ribbon 12-gore parachute canopy in subsonic and supersonic flow.** Nelsen, J.M. Sandia National Labs., Albuquerque, NM (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950550–4: 13. aerodynamics decelerator systems technology conference, Clearwater, FL (United States), 15-19 May 1995). Order Number DE95012236. Source: OSTI; NTIS; GPO Dep.

Computational fluid dynamic studies of 3-D, fixed geometry, gore-shaped parachute canopies are presented. Both solid and ribbon canopies with a 10% vent diameter are investigated. The flowfields analyzed are laminar and compressible, broaching both the subsonic and supersonic regimes. Results presented include characterization of the local and global flowfields and the internal and external canopy surface pressure distributions. The canopy surface pressure distributions may be utilized in subsequent structural analyses to assess the integrity of the parachute canopy fabric components.

21817 (SAND–95-0750C) **Evaluation of conductive, radiative, chemical, and convective heat transfer in complex systems using a fast-running, implicit, lumped-capacitance formulation.** Benjamin, A.S.; Beraun, R.; Brown, N.N.; Sherman, M.P. Sandia National Labs., Albuquerque, NM (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950828–9: National heat transfer conference, Portland, OR (United States), 5-9 Aug 1995). Order Number DE95011889. Source: OSTI; NTIS; GPO Dep.

Accurate finite-element simulation of 3-D nonlinear heat transfer in complex systems may require meshes composed of tens of thousands of finite elements and hours of CPU time on today's fastest computers. To treat applications in which thousands of calculations may be necessary such as for risk assessment or design of high-temperature manufacturing processes, methods are needed which can solve these problems far more efficiently and maintain an acceptably high degree of accuracy. For this purpose, we developed the Thermal Evaluation and Matching Program for Risk Applications (TEMPRA). The primary differentiator between TEMPRA and comparable codes is its numerical formulation, which is designed to be unconditionally stable even with very large time steps, to afford good accuracy even with relatively coarse meshing, and to facilitate benchmarking/calibration through the use of adjustable parameters. Analysis for a sample problem shows that TEMPRA can obtain temperature response solutions with errors of less than 10% using approximately 1/1000 of the computer time required by a typical finite element code.

21818 (SAND–95-0829C) **Simulations of hydrodynamic interactions among immersed particles in stokes flow using a massively parallel computer.** Ingber, M.S. (New Mexico Univ., Albuquerque, NM (United States). Dept. of Mechanical Engineering);

Womble, D.E.; Mondy, L.A. Sandia National Labs., Albuquerque, NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9507125–1: BEM 17: Boundary element methods, Madison, WI (United States), 17-19 Jul 1995). Order Number DE95011891. Source: OSTI; NTIS; GPO Dep.

In this paper, a massively parallel implementation of the boundary element method to study particle transport in Stokes flow is discussed. The numerical algorithm couples the quasistatic Stokes equations for the fluid with kinematic and equilibrium equations for the particles. The formation and assembly of the discretized boundary element equations is based on the torus-wrap mapping as opposed to the more traditional row- or column-wrap mappings. The equation set is solved using a block Jacobi iteration method. Results are shown for an example application problem, which requires solving a dense system of 6240 equations more than 1200 times.

21819 (WAPD-T–3064) **Piping elbow irrecoverable pressure loss coefficients for moderately high Reynolds numbers.** Coffield, R.D.; Brooks, P.S.; Hammond, R.B. Bettis Atomic Power Lab., West Mifflin, PA (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC11-93PN38195. (CONF-950965–1: ASME fluids engineering summer meeting, Hilton Head, SC (United States), 13-18 Sep 1995). Order Number DE95003873. Source: OSTI; NTIS; INIS; GPO Dep.

Test data is described for three different piping elbows. These include 900 elbows with radii of curvature of 1 2 and 1.5, and a 45° elbow with a radius of curvature of 1.2. These radii of curvature are sufficiently sharp to cause significant irrecoverable pressure losses to occur. The variation in static wall pressure was measured upstream and downstream of each elbow plus spatially around the elbow itself. Irrecoverable loss coefficients over a range of flows were obtained and correlations for the data are provided. The testing extended the Reynolds number range of the currently existing data base in various handbooks (and other references available in the open literature) by over a factor of five. Comparisons of results to predictions from the correlations of prior studies are provided.

21820 (CEA-CONF–12001) **CIVA workstation for NDE: mixing of NDE techniques and modeling.** Benoist, P. (CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. des Procedes et Systemes Avances); Besnard, R.; Bayon, G.; Boutaine, J.L. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. des Procedes et Systemes Avances. 1994. 8p. (CONF-9407185–: Conference on Quantitative Non Destructive Evaluation, Denver, CO (United States), 31 Jul - 5 aug 1994). Order Number DE95631334. Source: OSTI; NTIS (US Sales Only); INIS.

In order to compare the capabilities of different NDE techniques, or to use complementary inspection methods, the same components are examined with different procedures. It is then very useful to have a single evaluation tool allowing direct comparison of the methods: CIVA is an open system for processing NDE data; it is adapted to a standard work station (UNIX, C, MOTIF) and can read different supports on which the digitized data are stored. It includes a large library of signal and image processing methods accessible and adapted to NDE data (filtering, deconvolution, 2D and 3D spatial correlations...). Different CIVA application examples are described: brazing inspection (neutronography, ultrasonic), tube inspection (eddy current, ultrasonic), aluminium welds examination (UT and radiography). Modelling and experimental results are compared. 16 fig., 7 ref.

21821 (CONF-9509118–2) **Massively parallel simulation of welding processes.** Zacharia, T.; Simunovid, S. Oak Ridge National Lab., TN (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Modeling of casting, welding and advanced solidification processes 7; London (United Kingdom); 10-15 Sep 1995. Order Number DE95010221. Source: OSTI; NTIS; GPO Dep.

A computer program for three-dimensional transient analyses of welding processes has been modified for use on massively parallel computers. The computational model is based on a discrete element method that takes into account geometric variations of an object, heat transfer, fluid flow, deformable free surface, solid/liquid interface, buoyancy, electromagnetic and surface forces acting on a weld. The microstructure evolution during welding is simulated using the Monte Carlo technique based on the results obtained from the macroscopic discrete element analysis.

21822 (SAND–95-8530C) **Establishing multiaxial testing capabilities for tubular and planar specimens.** Brandon, S.L.; Korellis, J.S.; Kawahara, A. Sandia National Labs., Livermore, CA (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950569–1: 6. ASTM symposium on composites: fatigue and fracture, Denver, CO (United States), 16-18 May 1995). Order Number DE95010757. Source: OSTI; NTIS; GPO Dep.

Because of the desire to improve accuracy of plasticity models under multiaxial stress/strain states, and the need to test orthotropic materials such as composites, Sandia/CA developed two separate digitally-controlled materials testing systems. One is for Axial/Torsional/Pressure testing of tubular specimens instrumented with either strain gages (small strains) or a multiaxial extensometer (large strain). System capacity is 440kN (100,000pounds) axial plus 6kN-m (50,000inch-pounds) torsion plus 200MPa (30,000psi) internal pressure. The other is a planar biaxial system with 2MN (500,000pounds) capacity for testing composites and metals, with provisions for 1MN (250,000 pounds) in a third orthogonal axis for testing of pressure-sensitive materials and geomaterials.

21823 (STUK-YTO-TR–47) **Performance demonstration and personnel qualification for ultrasonic examination in service inspection of nuclear power plants.** Sillanpaeae, J.; Saerkiniemi, P. Finnish Centre for Radiation and Nuclear Safety (STUK), Helsinki (Finland). Feb 1993. 50p. (In Finnish). Order Number DE95632432. Source: OSTI; NTIS; INIS.

The ASME Code section XI (App. VII and VIII) requires that ultrasonic examination procedures, equipment and personnel used to detect and size flaws in reactor vessels, piping welds, bolts and studs shall be qualified by performance demonstration. The requirements for the qualifications of ultrasonic testing personnel and also the requirements for specimens, rules for the conduct of performance demonstrations and acceptance criteria have been clarified in this report. The preparation for these requirements is in progress and the situation in different countries e.g. US and England has been discussed. Also the possibilities to fulfill the requirements of Appendix VIII in Finland are dealt with. (29 refs., 7 figs., 5 tabs.).

21824 (UCRL-JC–118241) **Advanced ground penetrating radar.** Warhus, J.P. (Lawrence Livermore National Lab., CA (United States). Electronics Engineering Dept.); Mast, J.E.; Johansson, E.M.; Nelson, S.D. Lawrence Livermore National Lab., CA (United States). 26 Jul 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-940723–42: Annual meeting of the Society of Photo-Optical Instrumentation Engineers, San Diego, CA (United States), 24-29 Jul 1994). Order Number DE95012480. Source: OSTI; NTIS; GPO Dep.

An advanced Ground Penetrating Radar (GPR) system has the potential for efficiently and reliably providing high resolution images for inspecting concrete civil structures for defects and damage assessment. To achieve the required performance, improvements in radar hardware, and development and adaptation of advanced 2- and 3-dimensional synthetic aperture imaging techniques are needed. Recent and continuing advancement in computer and computer-related technology areas have made it possible to consider more complex and capable systems for a variety of imaging applications not previously conceived. The authors developed conceptual designs, analyzed system requirements, and performed experiments, modeling, and image reconstructions to study the feasibility of improving GPR technology for non-destructive evaluation of bridge decks and other high-value concrete structures. An overview and summary of practical system concepts and requirements, are presented.

21825 (UCRL-JC–120505) **Overview of nondestructive evaluation technologies.** Thomas, G. Lawrence Livermore National Lab., CA (United States). Apr 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9506126–4: Conference on nondestructive evaluation of aging infrastructure, Oakland, CA (United States), 6-8 Jun 1995). Order Number DE95011444. Source: OSTI; NTIS; GPO Dep.

The infrastructure in the US and the world is aging. There is an increasing awareness of the need to assess the severity of the damage occurring to the infrastructure. Limited resources preclude the replacement of all structures that need repairs or have exceeded their life times. Methods to assess the amount and severity of damage are crucial to implementing a systematic, cost effective approach to repair and/or replace the damaged structures. The challenges of inspecting aging structures without impairing their usefulness rely on a variety of technologies and techniques for nondestructive evaluation (NDE). This paper will briefly describe several nondestructive evaluation technologies that are required for inspecting a variety of systems and structures.

21826 (ANL/ET/CP–85778) **Computer modeling of radiation and combustion in a rotary solid-waste incinerator.** Chang, F.C. (Argonne National Lab., IL (United States)); Rhodes, C.A. Argonne National Lab., IL (United States); South Carolina Univ., Columbia, SC (United States). Dept. of Mechanical Engineering. [1995]. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950740–62: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95014236. Source: OSTI; NTIS; GPO Dep.

A mathematical model was developed to study the effect of the various particulates that occur in pulverized-coal flames of solid-waste incinerators. Radiation heat transfer between refractory surface and flame, transient conditions in the refractory, and chemical reactions in the waste material is included in the model. Radiation heat exchange is determined by the absorption factor technique. A first-order-chemical-reaction rate is assumed for the solid waste. This study takes into account the radiation emission, absorption, and scattering of gaseous media for water vapor and carbon dioxide contained in the combustion gases. Soot particles are also investigated. The variables are mass fraction, particle size, complex refractive index, and amount of solid waste. Rayleigh scattering is assumed for particles. Refractory-wall temperature variations, surface temperature of the refractory, solid-waste temperature, and solid-waste flow rates was investigated. This study is important for design purposes in determining the length of the incinerator required to completely burn the wastes.

21827 (DOE/CE/41003–T1) **CFCC radiant burner assessment. Final report, April 1, 1992–July 31, 1994.** Schweizer, S.; Sullivan, J. Alzeta Corp., Santa Clara, CA (United States). Nov 1994. 206p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC02-92CE41003. Order Number DE95012908. Source: OSTI; NTIS; GPO Dep.

The objective of this work was to identify methods of improving the performance of gas-fired radiant burners through the use of Continuous Fiber Ceramic Composites (CFCCs). Methods have been identified to improve the price and performance characteristics of the porous surface burner. Results are described.

21828 (ETDE-DE–135) **Development of pressurised fluidised bed combustion technique for coal-fired gas/steam processes.** Pitt, R.; Steven, H. Steinmueller (L.u.C.) GmbH, Gummersbach (Germany); Technische Hochschule Aachen (Germany). Lehrstuhl und Inst. fuer Dampf- und Gasturbinen. 1992. 14p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 0326702A. Order Number DE95786082. Source: OSTI; NTIS (US Sales Only).

The investigations for the development of the pressurized fluidized bed technique have shown that it is possible, in principle, to keep within the emission limits with the steady state pressurised fluidised bed combustion, even at low part load. However, the construction expense is considerable and the type of coal and grain size must comply relatively exactly with the design values. Not every fuel is suitable for fluidised bed combustion regarding emission. The most important parameter for emission is the temperature profile for this component, which should be as even as possible at a high temperature level. A sufficient dwell time of the gas and the particles is decisive for CO emission, where a minimum reaction time is required for both phases. (orig.)

21829 (SAND–95-8517C) **Vortical and industrial interactions.** Barr, P.K. (Sandia National Labs., Livermore, CA (United States). Combustion Research Facility). Sandia National Labs., Livermore, CA (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950283–3: Application of vortex methods to engineering problems forum, Albuquerque, NM (United States), 22-24 Feb 1995). Order Number DE95010700. Source: OSTI; NTIS; GPO Dep.

A vortex-dynamics-based model has been developed and used to study the importance of flame extinction by fluid dynamic strain that occurs in a pulse combustor. Results show that flame extinction by fluid dynamic stretch, which occurs during injection of the fresh charge, ensures the correct phase relation between the energy release and the resonant pressure wave. This phasing is required by Rayleigh's criterion for stable combustion-driven oscillations. However, this model also showed that the vortex dynamics technique is not at a stage where design engineers can use it as a predictive tool, just as they would use experimental testing. This is in part because pulse combustor designs being developed today use three-dimensional geometries and complex operating conditions, whereas the vortex model simulates processes occurring only in the combustion chamber, and ignores the rest of the pulse combustor unit. Also, the model assumes two-dimensional flow, a simple combustor geometry, and premixed combustion. A successful in-house manufacturing design code must be able to perform a complete design study reliably, quickly and easily, and on computers that are readily available to industry. Instead, the insight gained from the vortex dynamics model is being incorporated into a computational tool to assist in pulse combustor design. This tool will be used by industrial engineers to design pulse combustors for specific applications. The design tool combines submodels for acoustics, injection and combustion, producing a pulse combustor model that dynamically couples the processes in the combustion chamber to the acoustic waves.

Examination paper.

In 1989 a developing project was started with the aim of constructing a durable power unit in the 1 kW-class, where the power source consists of a Stirling engine with a diesel burner. The project was initiated by a need for a simple and fairly cheap 1 kW battery charger for 24 volt batteries. This report treat the performance monitoring of a diesel-powered Stirling engine and a permanently magnetized DC-machine in the 2kW-class. Parameters studied are overall efficiency and power output;, efficiency and shaft power of the Stirling engine;, and the connection between pressure, number of revolutions, and torque for the engine. 29 figs, 1 tab, 7 appendices with monitored data

21831 (CONF-950610–1) **A multilevel voltage-source converter system with balanced dc voltages.** Peng, Fang Zheng (Tennessee Univ., Knoxville, TN (United States)); Lai, Jih-Sheng; McKeever, J.; VanCoevering, J. Oak Ridge National Lab., TN (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Power electronics specialist conference; Atlanta, GA (United States); 12-15 Jun 1995. Order Number DE95009695. Source: OSTI; NTIS; GPO Dep.

A multilevel voltage-source converter system is proposed for high-voltage, high-power applications such as large induction motor drives, back-to-back interconnected power systems, and electrical traction drives. Multilevel voltage-source converters have a voltage unbalance problem in the dc capacitors. The problem may be solved by use of additional voltage regulators or separate dc sources. However, these solutions are found not to be practicable for most applications. The proposed converter system can solve the voltage unbalance problem of the conventional multilevel voltage-source converters, without using any additional voltage balance circuits or separate voltage sources. Mechanism of the voltage unbalance problem is analyzed theoretically in this paper. The validity of the new converter system is demonstrated by simulation and experiment.

Consists of vugraphs.

21835 (LA-UR–95-1502) **A chirped-pulse regenerative-amplifier FEL for the gamma-gamma collider.** Chan, K.C.D.; Goldstein, J.C.; Nguyen, D.C.; Takeda, H. Los Alamos National Lab., NM (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950512–104: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95011990. Source: OSTI; NTIS; INIS; GPO Dep.

During a Workshop on Gamma-Gamma Colliders in Lawrence Berkeley Laboratory, it was pointed out that an 1-μm laser that can produce 1-J, 1-ps pulses at a few hundred hertz is required. With high-power scalability and ease of formatting, an FEL can be a promising candidate for such a laser. The authors propose an FEL scheme based on chirped-pulsed regenerative amplification to achieve this high peak-power laser. The 1-ps pulse of a solid-state laser will be stretched, amplified, and recompressed to achieve the high peak power. The system is relatively simple and consists of mostly components that have already been demonstrated. This paper will describe the proposal and the important issues of such a scheme.

21836 (SAND–94-3205C) **An application of mechanical leverage to microactuation.** Sniegowski, J.J. (Sandia National Labs., Albuquerque, NM (United States)); Smith, C. Sandia National Labs., Albuquerque, NM (United States). [1994]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950650–1: 8. international conference on solid-state sensors and actuators and 9th biannual international conference and annual European conference on solid-state sensors, Stockholm (Sweden), 25-29 Jun 1995). Order Number DE95011883. Source: OSTI; NTIS; GPO Dep.

Preliminary results on the use of mechanical advantage to convert a short-displacement, high-force actuation mechanism into a long-displacement, medium-force actuator are presented. This micromechanical, mechanically-advantaged actuator is capable of relatively large displacement and force values. The target design values are lever ration of 17.5:1 leading to a $\pm$17.5 μN of force throughout providing no less than 2.25 μN of force throughout actuator's range of motion for an applied voltage of less tan 50 volts. The basis for the mechanical advantage is simple levers with fulcrums.

21837 (SAND–95-0084C) **Ion implantation processing for high-speed GaAs JFETs.** Zolper, J.C.; Baca, A.G.; Sherwin, M.E.; Shul, R.J. Sandia National Labs., Albuquerque, NM (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950518–11: 187. meeting of the Electrochemical Society, Reno, NV (United States), 21-26 May 1995). Order Number DE95013834. Source: OSTI; NTIS; GPO Dep.

GaAs Junction Field Effect Transistors (JFETs) offer a higher gate turn-on voltage, resulting in a better noise margin and reduced power dissipation, than the more widely employed GaAs MESFET. The primary reason the JFET has not been more widely used is the speed penalty associated with the gate/channel junction and corresponding gate length broadening. We present the ion implantation processes used for a self-aligned, all ion-implanted, GaAs JFET that minimizes the speed penalty for the JFET while maintaining the advantageous higher gate turn-on voltage. Process characterization of the p_+-gate implant done with either Mg, Zn, or Cd along with the co-implantation of P is presented. In addition, a novel backside channel confinement technology employing ion-implanted carbon is discussed. Complete JFET device results are reported.

21838 (SAND–95-0794C) **Impurity gettering.** Picraux, S.T. Sandia National Labs., Albuquerque, NM (United States). [1995]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9505211–1: DOE Council on Materials conference on new directions for ion beams in semiconductor processing, Santa Fe, NM (United States), 4-7 May 1995). Order Number DE95012227. Source: OSTI; NTIS; GPO Dep.

Transition metal impurities are well known to cause detrimental effects when present in the active regions of Si devices. Their presence degrades minority carrier lifetime, provides recombination-generation centers, increases junction leakage current and reduces gate oxide integrity. Thus, gettering processes are used to reduce the available metal impurities from the active region of microelectronic circuits. Gettering processes are usually divided into intrinsic (or internal) and extrinsic (or external) categories. Intrinsic refers to processing the Si wafer in a way to make available internal gettering sites, whereas extrinsic implies externally introduced gettering sites. Special concerns have been raised for intrinsic gettering. Not only will the formation of the precipitated oxide and denuded zone be difficult to achieve with the lower thermal budgets, but another inherent limit may set in. In this or any process which relies on the precipitation of metal silicides the impurity concentration can only

be reduced as low as the solid solubility limit. However, the solubilities of transition metals relative to silicide formation are typically found to be $\gtrsim 10^{12}/cm^3$ at temperatures of 800 C and above, and thus inadequate to getter to the needed concentration levels. It is thus anticipated that future microelectronic device processing will require one or more of the following advances in gettering technology: (1) new and more effective gettering mechanisms; (2) quantitative models of gettering to allow process optimization at low process thermal budgets and metal impurity concentrations, and/or (3) development of front side gettering methods to allow for more efficient gettering close to device regions. These trend-driven needs provide a driving force for qualitatively new approaches to gettering and provide possible new opportunities for the use of ion implantation in microelectronics processing.

21839 (SAND–95-0851C) **Surface micromachined microengine as the driver for micromechanical gears.** Garcia, E.J.; Sniegowski, J.J. Sandia National Labs., Albuquerque, NM (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950650–2: 8. international conference on solid-state sensors and actuators and 9th biannual international conference and annual European conference on solid-state sensors, Stockholm (Sweden), 25-29 Jun 1995). Order Number DE95011881. Source: OSTI; NTIS; GPO Dep.

The transmission of mechanical power is often accomplished through the use of gearing. The recently developed surface micromachined microengine provides us with an actuator which is suitable for driving surface micromachined geared systems. In this paper we will present aspects of the microengine as they relate to the driving of geared mechanisms, issues relating to the design of micro gear mechanisms, and details of a design of a microengine-driven geared shutter mechanism.

21840 (SAND–95-0998C) **Thin film circuit fabrication on diamond substrates for high power applications.** Norwood, D. (Sandia National Labs., Albuquerque, NM (United States)); Worobey, W.; Peterson, D.; Sweet, J.; Johnson, D.; Miller, D.; Andaleon, D. Sandia National Labs., Albuquerque, NM (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950840–1: International conference on applications of diamond films and related materials, Gaithersburg, MD (United States), 21-24 Aug 1995). Order Number DE95011887. Source: OSTI; NTIS; GPO Dep.

Sandia Laboratories has developed a thin film diamond substrate technology to meet the requirements for high power and high density circuits. Processes were developed to metallize, photopattern, laser process, and, package diamond thin film networks which were later assembled into high power multichip modules (MCMS) to test for effectiveness at removing heat. Diamond clearly demonstrated improvement in heat transfer during 20 Watt, strip heating experiments with junction-to-ambient temperature increases of less than 24 C compared to 126 C and 265 C for the aluminum nitride and ceramic versions, respectively.

21841 (SAND–95-1108C) **GaAs integrated circuit process characterization and non-destructive process monitoring by atomic force microscopy.** Baca, A.G.; Howard, A.J.; Shul, R.J.; Zolper, J.C.; Rieger, D.J. Sandia National Labs., Albuquerque, NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950518–5: 187. meeting of the Electrochemical Society, Reno, NV (United States), 21-26 May 1995). Order Number DE95013033. Source: OSTI; NTIS; GPO Dep.

We report a new application of atomic force microscopy (AFM) for process characterization of GaAs integrated circuit fabrication. By using the near atomic-level z-resolution of AFM, we are able to gain information not available by other imaging techniques in a number of steps in the sequence for GaAs IC fabrication. A nondestructive method of determining whether micron-sized vias have been etched to completion is presented. In addition, the AFM has been used to evaluate material removal following several of fabrication steps. Shallow trench formation occurs as a result of GaAs removal during the sidewall etch for a commonly used sidewall spacer process. This effect has been not been observed previously by other techniques. Other examples of unintentional removal of small amounts of GaAs during shallow wet and dry etches are presented. These examples show the utility of AFM as an in-line process characterization tool.

21842 (SAND–95-1193C) **Tuning a double quantum well Fermi surface with in-plane magnetic fields.** Simmons, J.A.; Harff, N.E.; Eiles, T.M.; Lyo, S.K.; Klem, J.F. Sandia National Labs., Albuquerque, NM (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950820–2: 11. international conference on the electronic properties of two dimensional systems, Nottingham (United Kingdom), 7-11 Aug 1995). Order Number DE95013867. Source: OSTI; NTIS; GPO Dep.

A double quantum well (QW) subject to in-plane magnetic fields $B_{||}$ has the dispersion curves of its two QWs shifted in k-space. When the QWs are strongly coupled, an anticrossing and partial energy gap occur, yielding a tunable multi-component Fermi surface. We report measurements of the resultant features in the conductance, capacitive density of states, and giant deviations in cyclotron effective masses.

21843 (SAND–95-8512C) **Time-dependent intensity and phase measurements of ultrashort laser pulses as short as 10 fs.** DeLong, K.W. (Sandia National Labs., Livermore, CA (United States)); Fittinghoff, D.N.; Ladera, C.L.; Trebino, R.; Taft, G.; Rundquist, A.; Murnane, M.M.; Kapteyn, H.C.; Christov, I.P. Sandia National Labs., Livermore, CA (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9507122–1: CLEO/Pacific Rim coal conference, Makuhar (Japan), 11-14 Jul 1995). Order Number DE95010915. Source: OSTI; NTIS; INIS; GPO Dep.

Frequency-Resolved Optical Gating (FROG) measures the time-dependent intensity and phase of an ultrashort laser pulse. Using FROG, we have tested theories for the operation of sub–10 fs laser oscillators.

21844 (SLAC-PUB–95-6885) **High-field strong-focusing undulator designs for X-ray Linac Coherent Light Source (LCLS) applications.** Caspi, S. (Stanford Linear Accelerator Center, Menlo Park, CA (United States)); Schlueter, R.; Tatchyn, R. Stanford Linear Accelerator Center, Menlo Park, CA (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (LBL–37216; CONF-950512–100: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95010744. Source: OSTI; NTIS; INIS; GPO Dep.

Linac-driven X-Ray Free Electron Lasers (e.g., Linac Coherent Light Sources (LCLSs)), operating on the principle of single-pass saturation in the Self-Amplified Spontaneous Emission (SASE) regime typically require multi-GeV beam energies and undulator lengths in excess of tens of meters to attain sufficient gain in the 1Å–0.1Å range. In this parameter regime, the undulator structure must provide: (1) field amplitudes B_0 in excess of 1T within periods of 4cm or less, (2) peak on-axis focusing gradients on the order of 30T/m, and (3) field quality in the 0.1%–0.3% range. In this paper the authors report on designs under consideration for a 4.5–1.5 Å LCLS based on superconducting (SC), hybrid/PM, and pulsed-Cu technologies.

21845 (UCRL-CR–112910-2) **Discrete modeling of optical pulse propagation in nonlinear media. Final report.** Ziolkowski, R.W. (Univ. of Arizona, Tucson, AZ (United States). Dept. of Electrical and Computer Engineering). Lawrence Livermore National Lab., CA (United States); Arizona Univ., Tucson, AZ (United States). Engineering Experiment Station. [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95011515. Source: OSTI; NTIS; GPO Dep.

With the continuing and heightened interest in nonlinear semiconductor and optically integrated devices, more accurate and realistic numerical simulations of these devices and systems are in demand. Such calculations provide a testbed in which one can investigate new basic and engineering concepts, materials, and device configurations before they are fabricated. This encourages multiple concept and design iterations that result in enhanced performances and system integrations of those devices. They also provide a framework in which one can interpret complex experimental results and suggest further diagnostics or alternate protocols.

Thus the time from device conceptualization to fabrication and testing could be enormously improved with numerical simulations that incorporate more realistic models of the linear and nonlinear material responses and the actual device geometries. The authors have successfully developed a finite difference time domain method that simulates the propagation of ultra-short optical pulses in nonlinear materials which can be described with a linear Lorentz dispersion model, an instantaneous nonlinear Kerr model and a retarded nonlinear Raman model. They have used this NL-FDTD method to model and characterize several ultra-short optical pulse configurations including linear and nonlinear optical waveguides that could be used as all-optical output couplers and beam steerers.

21846 (UCRL-ID–109089-93) **Laser programs highlights 1993.** Lawrence Livermore National Lab., CA (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95012473. Source: OSTI; NTIS; GPO Dep.

Over the last two decades, the scope of our laser research has grown immensely. The small, low-power laser systems of our early days have given way to laser systems of record-breaking size and power. Now we are focusing our activities within the target physics and laser science programs to support the ignition and gain goals of the proposed glass-laser National Ignition Facility. In our laser isotope separation work, we completed the most important set of experiments in the history of the AVLIS Program in 1993, which culminated in a spectacularly successful run that met or exceeded all our objectives. We are also developing lasers and laser-related technologies for a variety of energy, commercial, and defense uses. On the horizon are transfers of important technologies for waste treatment, x-ray lithography, communications and security, optical imaging, and remote sensing, among others.

21847 (UCRL-ID–118761) **Energy and particle flow in low temperature plasmas.** Bardsley, J.N.; Hewett, D.W.; Vitello, P. Lawrence Livermore National Lab., CA (United States). 16 Mar 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95012104. Source: OSTI; NTIS; GPO Dep.

Increased interest in the development of high density plasma sources for ultra large scale integrated circuit manufacturing with varying geometry and power coupling strategies require the development of 2D models for accurate plasma reactor studies. An objective of their research was to develop a computationally efficient numerical code that would be useful as a design tool for inductively coupled plasma reactors. To achieve that goal the authors created a 2D fluid model (INDUCT2D) of an argon discharge. As uniformity is a primary issue in wafer manufacturing they have used INDUCT2D to investigate the effect of pressure and reactor geometry on the spatial uniformity of the etching ion flux. They have found that the optimum pressure for maximum uniformity depends upon the spatial profile of the inductive heating, and decreases with the reactor aspect ratio.

21848 (UCRL-JC–117360) **Temporal dynamics of the multi-frequency spectrum generated by self-phase modulation of two frequencies in single-mode fiber.** Pennington, D.M.; Henesian, M.A.; Brown, C.G.; Danforth, P.M.; Eimerl, D. Lawrence Livermore National Lab., CA (United States). Jun 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-941006–6: SPIE annual conference of the Optical Society of America and exhibit, Boston, MA (United States), 30 Oct - 4 nov 1994). Order Number DE95010920. Source: OSTI; NTIS; GPO Dep.

The authors report the development of a tunable bandwidth source based on self-phase modulation of two frequencies in an optical fiber. A single frequency pulse was obtained by placing a 688 μm etalon with finesse = 3.3 in a single mode, single frequency Q-switched ND:YLF oscillator. Angle tuning of the etalon allowed continuous frequency tuning of the oscillator by $\pm$ 2.5 Å about the central frequency of 10,530.3 Å. Two oscillators were modified and tuned to 10,532.8 Å and 10,527.8 Å, respectively. Additional tests performed with a 344 μm etalon allowed tuning of $\pm$5 Å, but with reduced output energy and stability ($\pm$ 20%); however, pulse to pulse energy fluctuations can be compensated for by the use of a pulse energy regulator if a broader range of tunability is required. The output beams were temporally and spatial overlapped, and shortened to an 11 ns nominally square pulse with a 3 ns rise and fall via a Pockels cell. Two Pockels cells were required to reduce nonlinear effects in the fiber due to prelase signal. The two frequencies were coupled into a 10 m single-mode polarization preserving fiber with a 4.2 x 7.4 μm core diameter and an effective mode area of 64 μm. The beam energy was recorded at the input and output of the fiber. The output spectrum was recorded with a spectrometer/optical multichannel analyzer, and the temporal pulse shape of each frequency was recorded by spectrally dispersing the far field beam and re-imaging it onto a streak camera.

21849 (UCRL-JC–117794) **Multiple pulse traveling wave excitation of neon-like germanium.** Moreno, J.C.; Nilsen, J.; Da Silva, L.B. Lawrence Livermore National Lab., CA (United States). Jun 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-940592–12: 4. international colloquium on X-ray lasers, Williamsburg, VA (United States), 16-20 May 1994). Order Number DE95012458. Source: OSTI; NTIS; GPO Dep.

Traveling wave excitation has been shown to significantly increase the output intensity of the neon-like germanium x-ray laser. The driving laser pulse consisted of three 100 ps Gaussian laser pulses separated by 400 ps. Traveling wave excitation was employed by tilting the wave front of the driving laser by 45 degrees to match the propagation speed of the x-ray laser photons along the length of the target. The authors show results of experiments with the traveling wave, with no traveling wave, and against the traveling wave and comparisons to a numerical model. Gain was inferred from line intensity measurements at two lengths.

21850 (UCRL-JC–118281) **Total Internal Reflection Microscopy (TIRM) as a nondestructive surface damage assessment tool.** Liao, Z.M.; Cohen, S.J.; Taylor, J.R. Lawrence Livermore National Lab., CA (United States). Oct 1994. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9410155–3: 26. annual symposium on optical materials for high power lasers: Boulder damage symposium, Boulder, CO (United States), 24-26 Oct 1994). Order Number DE95010748. Source: OSTI; NTIS; GPO Dep.

An easy to use, nondestructive, method for evaluating subsurface damage in polished substrates has been established at LLNL. Subsurface damage has been related to laser damage in coated optical components used in high power, high repetition rate laser systems. Total Internal Reflection Microscopy (TIRM) has been shown to be a viable nondestructive technique in analyzing subsurface damage in optical components. A successful TIRM system has been established for evaluating subsurface damage on fused silica components. Laser light scattering from subsurface damage sites is collected through a Nomarski microscope. These images are then captured by a CCD camera for analysis on a computer. A variety of optics, including components with intentional subsurface damage due to grinding and polishing, have been analyzed and their TIRM images compared to an existing destructive etching method. Methods for quantitative measurement of subsurface damage are also discussed.

21851 (UCRL-JC–119202) **Impact of three-dimensional nonuniformity on the germanium x-ray laser output.** Wan, A.S. (Lawrence Livermore National Lab., CA (United States)); Mayle, R.W.; Osterheld, A.L.; Kato, Y. Lawrence Livermore National Lab., CA (United States). Apr 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950476–4: 12. international conference on laser interaction and related plasma phenomena, Osaka (Japan), 24-28 Apr 1995). Order Number DE95013429. Source: OSTI; NTIS; GPO Dep.

We are studying the impact of axial nonuniformity of the driving optical laser on the output of x-ray lasers. In this paper we use typical laser focusing parameters from germanium x-ray laser experiments on Gekko XII which has a bowtie-shaped line focus that results in large axial differences of the incident intensity on target This axial nonuniformity of the driving laser intensity produced significant axial variations of spatial gain and density profiles. In this paper we contrast the x-ray laser output of axially homogeneous and in homogeneous germanium x-ray lasers using the numerical

simulation code, XRASER, which includes the effect of laser photon transport, saturation, and refractive propagation in three spatial dimensions and two angular directions of photon phase space.

21852 (UCRL-JC–120006) **Phase control and measurement of ultrashort optical pulses.** Sullivan, A. (Lawrence Livermore National Lab., CA (United States)); White, W.E.; Chu, K.C.; Heritage, J.P. Lawrence Livermore National Lab., CA (United States). 10 Feb 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950226–40: SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine, San Jose, CA (United States), 5-14 Feb 1995). Order Number DE95011746. Source: OSTI; NTIS; GPO Dep.

We have used the Direct Optical Spectral Phase Measurement (DOSPM) technique to characterize the cubic phase tuning ability of our pulse stretcher. We have compared the measured phase to the phase determined from cross-correlation measurements.

21853 (WHC-SD-LL-ATP–023) **GENRTC Project No. 2F3E0A, OCB A-382, acceptance test procedure.** Akerson, A.W. Westinghouse Hanford Co., Richland, WA (United States). 10 Apr 1995. 75p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010739. Source: OSTI; NTIS; GPO Dep.

This test procedure provides the steps necessary to verify correct functional operation of controls, annunciators, alarms, protective relays and related systems impacted by CENRTC #2F3E0A, Microwave Transfer Trip Project, modification work performed under work package 6B-93-00040/M (CENRTC 2F3E0A MWTT OCB A-382 PACKAGE).

43 PARTICLE ACCELERATORS

21855 (ANL/ASD/CP–84988) **Overall design concepts for the APS storage ring machine protection system.** Lumpkin, A.; Fuja, R.; Votaw, A.; Wang, X.; Shu, D.; Stepp, J.; Arnold, N.; Nawrocki, G.; Decker, G.; Chung, Y. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–221: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013763. Source: OSTI; NTIS; INIS; GPO Dep.

The basic design and status of the machine protection system for the Advanced Photon Source (APS) storage ring are discussed. The machine is passively safe to the bending magnet sources, but the high power of the insertion devices requires missteering conditions to be identified and the beam aborted in less than one millisecond. The basic aspects of waterflow, temperature, beam position, etc. monitoring are addressed. Initial commissioning of subsystems and sensors is statused.

21856 (ANL/ASD/CP–85006) **Lattice considerations for a tau-charm factory.** Teng, L.C.; Crosbie, E.A. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950512–180: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013410. Source: OSTI; NTIS; INIS; GPO Dep.

The magnet lattice appropriate for a tau-charm factory had been studied extensively. Here we discuss two possible simplifying features which make the design, construction, and operation of the machine simpler without sacrificing performance. These two features may be characterized and identified as (a) luminosity optimization in the "monochromatic" mode, and (b) chromaticity correction with sextupoles only in the arcs.

21857 (ANL/ASD/CP–85047) **Radiation measurements at the Advanced Photon Source (APS) linear accelerator.** Moe, H.J.; Vacca, J.H.; Veluri, V.R.; White, M. Argonne National Lab., IL (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–218: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013699. Source: OSTI; NTIS; INIS; GPO Dep.

The injector and source of particles for the Advanced Photon Source is a 2856-MHz, S-band, electron-positron linear accelerator (linac). It produces electrons with energies up to 650 MeV or positrons with energies up to 450 MeV. Radiation measurements were made during normal electron and positron operation, as well as during several beam loss scenarios. Neutron and gamma measurements made outside the shielding walls during normal operation are within DOE guidelines. Measured radiation fields are compared to predicted levels for different conditions.

21858 (ANL/PHY/CP–85475) **Accelerator complex for a radioactive ion beam facility at ATLAS.** Nolen, J.A. Argonne National Lab., IL (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–205: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013525. Source: OSTI; NTIS; INIS; GPO Dep.

Since the superconducting heavy ion linac ATLAS is an ideal post-accelerator for radioactive beams, plans are being developed for expansion of the facility with the addition of a driver accelerator, a production target/ion source combination, and a low q/m pre-accelerator for radioactive ions. A working group including staff from the ANL Physics Division and current ATLAS users are preparing a radioactive beam facility proposal. The present paper reviews the specifications of the accelerators required for the facility.

21859 (BNL–61776) **The RHIC status update.** Ozaki, S. Brookhaven National Lab., Upton, NY (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950127–12: 11. international conference on ultra-relativistic nucleus-nucleus collisions, Monterey, CA (United States), 9-13 Jan 1995). Order Number DE95012518. Source: OSTI; NTIS; INIS; GPO Dep.

This report gives a brief discussion of the progress on the Brookhaven RHIC.

21860 (FEI–2379) **Focusing of ion beam with limit emittance by accelerator tube of electrostatic accelerator.** Bazhal, S.V.; Romanov, V.A. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1994. 17p. (In Russian). Order Number DE95633504. Source: OSTI; NTIS (US Sales Only); INIS.

Focusing of nonrelativistic ion beam with finite emittance by accelerator tube is considered. Analytical relation between positions of the entrance and exit crossovers as a function of the beam emittance and the accelerator tube parameters was obtained. The comparison of conditions providing crossover to crossover transformation and conditions of entrance crossover optical image forming was carried out. 10 refs.; 3 figs.

21861 (FEI–2389) **Accelerator complex with low-energy mixed electron-proton beams.** Glotov, A.I.; Bashmakov, V.S.; Kupriyanov, B.V.; Nikitin, V.A.; Chalyj, Yu.R.; Shlyapnikov, S.V.

Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1994. 14p. (In Russian). Order Number DE95633505. Source: OSTI; NTIS (US Sales Only); INIS.

A simulating accelerator complex was developed for space, material, solid state physics, biology and medical researches. It provides a uniform irradiation of large targets in an outward vacuum chamber by electron and proton beams simultaneously or separately in the energy range of 30-150 keV. The electrostatic electron and proton beams scanning system with linear voltage time change allows to obtain a uniform beam density distribution on the target and a wide range control of scanning raster. 3 figs.

21862 (FNAL/C–95/123) **Radiation shielding of the main injector.** Bhat, C.M.; Martin, P.S. Fermi National Accelerator Lab., Batavia, IL (United States). May 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-950512–201: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013243. Source: OSTI; NTIS; INIS; GPO Dep.

The radiation shielding in the Fermilab Main Injector (FMI) complex has been carried out by adopting a number of prescribed stringent guidelines established by a previous safety analysis. Determination of the required amount of radiation shielding at various locations of the FMI has been done using Monte Carlo computations. A three dimensional ray tracing code as well as a code based upon empirical observations have been employed in certain cases.

21863 (JINR–94-1, pp. 92-93) **Deuteron cyclotron complex as a meson and neutron generator.** Alenitskij, Yu.G. (Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems); Glazov, A.A.; Denisov, Yu.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation); Joint Inst. for Nuclear Research, Dubna (Russian Federation). 21864 (LA-UR–95-1507) **Modified PARMILA code for new accelerating structures.** Takeda, H.; Stovall, J.E. Los Alamos National Lab., NM (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950512–105: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95011988. Source: OSTI; NTIS; INIS; GPO Dep.

The PARMILA code was originally developed as a numerical tool to design and simulate the beam performance of the drift-tube linac (DTL). The authors have extended PARMILA to the design of both the coupled-cavity linac (CCL) and the coupled-cavity drift-tube linac (CCDTL). They describe the new design and simulation features associated with these linac structures and improvements to the code that facilitate a seamless linac design process.

21865 (LA-UR–95-1508) **A compact high-power proton linac for radioisotope production.** Takeda, H.; Billen, J.H.; Nath, S.; Stovall, J.E.; Wood, R.L.; Young, L.M. Los Alamos National Lab., NM (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950512–107: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95011987. Source: OSTI; NTIS; INIS; GPO Dep.

Conventional designs for proton linacs use a radiofrequency quadrupole (RFQ), followed by a drift-tube linac (DTL). For higher final beam energies, a coupled cavity linac (CCL) follows the DTL. A new structure, the coupled-cavity drift-tube linac (CCDTL) combines features of an Alvarez DTL and the CCL. Operating in a $\pi/2$ structure mode, the CCDTL replaces the DTL and part of the CCL for particle velocities in the range $0.1 < \beta < 0.5$. The authors present a design concept for a compact linac using only an RFQ and a CCDTL. This machine delivers a few mA of average beam current at a nominal energy of 70 MeV and is well suited for radioisotope production.

21866 (LA-UR–95-1566) **Linac-driven spallation-neutron source.** Jason, A.J. Los Alamos National Lab., NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950512–152: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95011973. Source: OSTI; NTIS; INIS; GPO Dep.

Strong interest has arisen in accelerator-driven spallation-neutron sources that surpass existing facilities (such as ISIS at Rutherford or LANSCE at Los Alamos) by more than an order of magnitude in beam power delivered to the spallation target. The approach chosen by Los Alamos (as well as the European Spallation Source) provides the full beam energy by acceleration in a linac as opposed to primary acceleration in a synchrotron or other circular device. Two modes of neutron production are visualized for the source. A short-pulse mode produces 1 MW of beam power (at 60 pps) in pulses, of length less than 1 ms, by compression of the linac macropulse through multi-turn injection in an accumulator ring. A long-pulse mode produces a similar beam power with 1-ms-long pulses directly applied to a target. This latter mode rivals the performance of existing reactor facilities to very low neutron energies. Combination with the short-pulse mode addresses virtually all applications.

21867 (LBL–36841) **Development of a two-beam high-current ion accelerator based on Doppler effect. Final report (1994).** Ivanov, B.I. (Kharkov Institute of Physics & Technology (Ukraine)); Yegorov, A.M. Lawrence Berkeley Lab., CA (United States). Mar 1995. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95012440. Source: OSTI; NTIS; INIS; GPO Dep.

This Final Report presents the results of work accomplished in accordance with the Scope of Work to the Purchase Order No 4596310. The amount of works includes the following items: 1. Start of the manufacture of the Experimental Accelerating Stand (EAS)-the section for proton acceleration from 5 MeV to 8 MeV, in which RF fields are excited by an electron beam at the anomalous Doppler effect. 2. Theoretical investigation and computer simulation of field excitation and ion acceleration in the EAS. Under item 1, the EAS manufacturing is begun. To present time, a pedestal for the EAS and a stainless steel vacuum chamber for RF resonator are made (length of the chamber is about 180 cm, diameter is about 40 cm). Besides, parts of the EAS resonator with the acceleration structure are manufactured, and its assembly is begun. Under item 2, it is realized three works: calculation of increment and frequency shift of the EAS resonator excited by electron beam, calculation of the solenoid for creation of magnetic field with required spatial distribution, and theoretical investigation and computer simulation of ion acceleration in the EAS. 14 figs., 16 refs.

21868 (SAND–95-0915C) **High average power, high current pulsed accelerator technology.** Neau, E.L. Sandia National Labs., Albuquerque, NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950512–157: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95011603. Source: OSTI; NTIS; GPO Dep.

Which current pulsed accelerator technology was developed during the late 60's through the late 80's to satisfy the needs of various military related applications such as effects simulators, particle beam devices, free electron lasers, and as drivers for Inertial Confinement Fusion devices. The emphasis in these devices is to achieve very high peak power levels, with pulse lengths on the order of a few 10's of nanoseconds, peak currents of up to 10's of MA, and accelerating potentials of up to 10's of MV. New which average power systems, incorporating thermal management techniques, are enabling the potential use of high peak power technology in a number of diverse industrial application areas such as materials processing,, food processing, stack gas cleanup, and the destruction of organic contaminants. These systems employ semiconductor and saturable magnetic switches to achieve short pulse durations that can then be added to efficiently give MV accelerating, potentials while delivering average power levels of a few 100's of kilowatts to perhaps many megawatts. The Repetitive High Energy Puled Power project is developing short-pulse, high current accelerator technology capable of generating beams with kJ's of

energy per pulse delivered to areas of 1000 cm^2 or more using ions, electrons, or x-rays. Modular technology is employed to meet the needs of a variety of applications requiring from 100's of kV to MV's and from 10's to 100's of kA. Modest repetition rates, up to a few 100's of pulses per second (PPS), allow these machines to deliver average currents on the order of a few 100's of mA. The design and operation of the second generation 300 kW RHEPP-II machine, now being brought on-line to operate at 2.5 MV, 25 kA, and 100 PPS will be described in detail as one example of the new high average power, high current pulsed accelerator technology.

21869 (SLAC–451, pp. 98-131) **The consideration of Tau-Charm Factory construction in China.** Zhipeng, Zheng (IHEP, Beijing (China)). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Oct 1994. (CONF-9408190–: Tau-Charm factory in the era of B-factories and CESR conference, Stanford, CA (United States), 15-16 Aug 1994). In *The Tau-Charm Factory in the ERA of B-Factories and CESR.* 763p. Order Number DE95007894. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents a proposal to extend the present Beijing Electron Positron Collider into a Tau Charm Factory. To achieve this aim the author points out that a number of things need to come together, and to be successfully communicated to the Chinese government. Such a machine is a logical extension of the present BEPC device. The physics which can be accomplished at such a device, is important, and cannot be duplicated in planned meson factories, due to the presence of resonances and thresholds which allow minimization of systematic errors. The author stresses the need for international coorperation on this project, to have hope of it coming to fruition. The whole concept of such a Tau Charm Factory needs more support from the high energy physics community.

21870 (SLAC-PUB–95-6849) **Parameters of the SLAC Next Linear Collider.** Raubenheimer, T. (and others); Adolphsen, C.; Burke, D. Stanford Linear Accelerator Center, Menlo Park, CA (United States). May 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-950512–136: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013279. Source: OSTI; NTIS; INIS; GPO Dep.

In this paper, the authors present the parameters and layout of the Next Linear Collider (NLC). The NLC is the SLAC design of a future linear collider using X-band RF technology in the main linacs. The collider would have an initial center-of-mass energy of 0.5 TeV which would be upgraded to 1 TeV and then 1.5 TeV in two stages. The design luminosity is $> 5 \times 10^{33}$ cm^{-2} sec^{-1} at 0.5 TeV and $> 10^{34}$ cm^{-2} sec^{-1} at 1.0 and 1.5 TeV. They briefly describe the components of the collider and the proposed energy upgrade scenario.

21871 (SSC–53-App.1) **Research and development for the supercollider. Appendix 1.** Tigner, M. (Universities Research Association, Waxahachie, TX (United States)). Superconducting Super Collider Lab., Dallas, TX (United States). 29 Oct 1985. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011213. Source: OSTI; NTIS; GPO Dep.

Chairman Fuqua and members of the Subcommitte, I would like to thank you for this opportunity to describe the status of the supercollider research and development program. Over two years have now elapsed since SSC was given the highest priority by the US high energy community. Shortly after, in the fall of 1983, the Department of Energy formally initiated the R&D phase for this potential facility. The developments in the physics world during these past two years have strengthened the arguments for the SSC. Furthermore, the national effort devoted to the SSC R&D during that time has provided us with firm evidence that the SSC can be built with the existing technology and within the cost estimates originally calculated a year and a half ago. I would like to describe for you today some of the accomplishments of this R&D effort and tell you about our plans for the future. I would also like to touch briefly on the important subject of international collaboration. The main objectives of the research and development effort are: (1) to develop and optimize the components necessary for construction of the SSC. Because the magnets are by far the single most expensive and most critical element of the SSC, the major effort during the past two years has been directed in this area; (2) to perform systems tests of the-magnets and the associated cryogenic and control systems, and thus to optimize the systems aspects of the proposed machine; (3) to define the requirements that have to be satisfied by potential SSC sites; (4) to prepare a complete conceptual design of the SSC, including a detailed cost estimate, and the projected schedule for the construction, tests and start-up of the whole facility.

21872 (SSC–246) **Recommendations following the meetings of September 18–19, 1989 held in DeSoto, Texas.** Superconducting Super Collider Lab., Dallas, TX (United States). 11 Oct 1989. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-8909505–Summ.: Underground Technology Advisory Panel (UTAP) meeting, DeSoto, TX (United States), 18-19 Sep 1989). Order Number DE95011176. Source: OSTI; NTIS; GPO Dep.

This report summarizes recommendations made by the Underground Technology Advisory Panel (UTAP) to the Superconducting Super Collider (SSC) Laboratory, subsequent to meetings held on September 18 and 19, 1989. The panel was convened at the request of Mr. Robert Crawley. Deputy Manager of the Conventional Construction Division for the SSC. A list of UTAP members and meeting agenda are appended to this report. The meeting was held at the Holiday Inn, DeSoto, TX, during which time presentations were made by members of the SSC Laboratory staff on the Texas site geology, site exploration, ring placement, experimental halls, and main beam tunnels and shafts. Information conveyed at the meetings is in the public domain, and has been collected and filed as part of the SSC Laboratory Notes which are available through the SSC Laboratory. Recommendations pertaining to the geotechnical program, presentation of geotechnical information, startup tunnel, groundwater and subsidence monitoring, location of the ring, tunnel and special tunnel areas, and experimental halls are summarized under the headings which follow.

21873 (SSCL–622) **Is transverse feedback necessary for the SSC emittance preservation? (Vibration noise analysis and feedback parameters optimization).** Parkhomchuk, V.V.; Shiltsev, V.D. Superconducting Super Collider Lab., Dallas, TX (United States). Jun 1993. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011148. Source: OSTI; NTIS; INIS; GPO Dep.

The paper considers the Superconducting Super Collider (SSC) site ground motion measurements as well as data from accelerators worldwide about noises that worsen beam performance. Unacceptably fast emittance growth due to these noises is predicted for the SSC. A transverse feedback system was found to be the only satisfactory alternative to prevent emittance decay. Optimization of the primary feedback parameters was done.

21874 (SSCL-Preprint–38) **Parameter selection for the SSC trade-offs and optimization.** Edwards, D.A.; Syphers, M.J. Superconducting Super Collider Lab., Dallas, TX (United States). 14 Oct 1991. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011046. Source: OSTI; NTIS; INIS; GPO Dep.

In November of 1988, a site was selected in the state of Texas for the SSC. In January of 1989, the SSC Laboratory was established in Texas to adapt the design of the collider to the site and to manage the construction of the project. This paper describes the evolution of the SSC design since site selection, notes the increased concentration on the injector system, and addresses the rationale for choice of parameters.

21875 (SSCL-Preprint–148) **Object-oriented simulation for the Superconducting Super Collider.** Zhou, Jiasheng (Superconducting Super Collider Lab., Dallas, TX (United States)); Chung, Moon-Jung. Superconducting Super Collider Lab., Dallas, TX (United States). Oct 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011102. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the design and implementation of an object-oriented simulation environment called OZ for the Superconducting Super Collider (SSC). The design applies object-oriented

technology to data visualization, behavior modelling, dynamic simulation and version control. A meta class structure is proposed to model different types of objects in large systems by their functionality. OZ provides a direct-manipulation user interface which allows the user to visualize the data as an object in the database and interactively model the component of the system. Modelling can be exercised at different levels of the class hierarchy and then can be dynamically bound into a system for simulation. Inheritance is used to derive new configurations of the system or subsystem from the existing one, and specify an object's behavior. Delegation is used to construct a system by instantiating existing objects and "stealing" their methods by delegators.

21876 (SSCL-Preprint–168) **SSC design update.** Syphers, M.J. Superconducting Super Collider Lab., Dallas, TX (United States). Nov 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011106. Source: OSTI; NTIS; INIS; GPO Dep.

Recent developments in the design and construction of the SSC are presented. Topics include status of the 20 TeV Collider rings, including interaction regions, utility regions, and main arcs, plus some remarks on the injector accelerators. Remaining issues facing the design of the colliding beams synchrotron and its injectors are discussed.

21877 (SSCL-Preprint–559) **Overview of radiation protection at the Superconducting Super Collider Laboratory.** Baker, S.; Britvich, G.; Bull, J.; Coulson, L.; Coyne, J.; Mokhov, N.; Romero, V.; Stapleton, G. Superconducting Super Collider Lab., Dallas, TX (United States). Mar 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-940424–39: 8. international conference on radiation shielding, Arlington, TX (United States), 24-27 Apr 1994). Order Number DE95011038. Source: OSTI; NTIS; INIS; GPO Dep.

The radiation protection program at the Superconducting Super Collider Laboratory is described. After establishing a set of stringent design guidelines for radiation protection, both normal and accidental beam losses for each accelerator were estimated. From these parameters, shielding requirements were specified using Monte-Carlo radiation transport codes. A groundwater activation model was developed to demonstrate compliance with federal drinking water standards. Finally, the environmental radiation monitoring program was implemented to determine the effect of the facility operation on the radiation environment.

21878 (SSCL-SR–1210) **SSCL Commissioning and Operations.** Superconducting Super Collider Lab., Dallas, TX (United States). 31 Mar 1992. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011163. Source: OSTI; NTIS; INIS; GPO Dep.

The SSC, with an energy of 20 TeV/Beam, requires a sequence of individual accelerators of increasing energy in the injector chain. These are the Linac, Low Energy Booster, Medium Energy Booster, and High Energy Booster. Each accelerator system must be completed in sequence in order to provide beam to the next higher energy accelerator. The collider itself is comprised of ten sectors, each of which in terms of superconducting magnet bending strength, is equivalent to two HEB injectors. The completion of all injectors and collider sectors is required before stored beams can circulate in preparation for colliding beam operation. Four experimental halls are planned for the detector systems. Each major detector will be assembled in one of the halls by a world-wide collaboration of scientists. In addition, above ground facilities provide shops and test facilities for accelerator technical systems, superconducting magnet and materials research and development, and for detector assembly and operations. The purpose of this report is to present a plan for the sequential commissioning and operation of these individual accelerators and other technical facilities of the SSC. A central objective of this plan is to describe the activities at the SSCL that are not included as part of the construction project TPC, even though they occur during the overall project construction time-frame. Examples of such activities include the operation of general laboratory facilities and services not specifically related to construction, the operating costs for the individual accelerators in the injector chain once these facilities have been commissioned, and the costs of SSCL physics research groups. The Department of Energy has provided the following decision with regard to these operations categories for the SSCL.

21879 (SSCL-SR–1220) **Report of the tunnel safety working group.** Gannon, J. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1991. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011165. Source: OSTI; NTIS; INIS; GPO Dep.

On 18 February 1991 the Project Manager formed a working group to address the safety guidelines and requirements for the underground facilities during the period of accelerator construction, installation, and commissioning. The following report summarizes the research and discussions conducted by the group and the recommended guidelines for safety during this phase of the project.

21880 (SSCL-SR–1230) **Review of scientific and technical options for the Superconducting Super Collider Program.** Dombeck, T. Superconducting Super Collider Lab., Dallas, TX (United States). Nov 1993. 82p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011168. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a review of options for the Superconducting Super Collider (SSC) Program. It is the result of an informal study by an ad-hoc working group consisting of Laboratory physicists and engineers who investigated the physics and technical implications of a number of possible alternative SSC programs. Previous studies have shown, and early in this study it was confirmed, that a collider of approximately 20 TeV protons on 20 TeV protons with a luminosity of 10^{33} $cm^{-2}s^{-1}$ at each interaction region is needed to support a physics program that is guaranteed to answer existing particle physics questions and make new discoveries. Therefore, all options considered in this document were consistent with attainment of these original goals for the SSC. One promising option considered was a program of colliding anti-protons on protons as a possible means to reduce the cost of the SSC by eliminating one of the Collider rings. However, the luminosity requirements to obtain the SSC physics goals remains the same as for protons colliding with protons and this study confirms that even though progress has been made over the last ten years in obtaining the high intensity anti-proton beams necessary, a luminosity higher than 10^{32} cannot be guaranteed. Other options were examined to see what advantages could be derived by departing from the SSC baseline program, either in schedule, in parameters, by staging, or by combinations of these options. Even though we considered re-examination of the cost of the baseline program to be beyond the scope of this document, differential cost savings were estimated. Finally, a brief survey of progress over the last ten years in various technical areas that might lead to more cost effective engineering designs was included in this study, such as higher magnetic field magnets resulting from lower operating temperatures or higher current-carrying superconducting materials.

21881 (SSCL-SR–1232) **Technical Site Information: Planning group of the Directorate and Conventional Construction Division.** Superconducting Super Collider Lab., Dallas, TX (United States). Nov 1993. 118p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011170. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents the technical site information for the Superconducting Super Collider project. The Ellis County, Texas site was selected by the Department of Energy in 1989. After assembling the initial staff at temporary facilities in Dallas, the SSC Laboratory began site-specific design work. The resulting design for the SSC accelerators, experimental areas, and laboratory facilities were described in the Site-Specific Conceptual Design Report of July 1990. Since then, design specifications for the technical components and conventional facilities have been formulated. In fact, a very significant amount of surface and underground construction has been initiated and many buildings have been completed. Testing of prototypes for most technical components is advanced. The construction phase of the SSC project is approximately 20% complete. At this time, it is appropriate to capture the conventional design work which has taken place since 1990. This documents records regional and physical information used in site studies, summarizes the site studies for conventional facilities, and presents site layouts for buildings and utilities as they would have been at

the end of the construction project. As such, this documents summarizes and complements the work of many groups in the SSC laboratory, the Texas National Research Laboratory Commission (TNRLC), and several subcontractors to the SSC project. The document contains extensive references to their work contained in other drafts and final reports. In particular, it borrows heavily from the Site Development Plan (released in draft form in January, 1992) which has, to date, guided aspects of site development.

21882 (SSC-SR–1012) **Cost comparisons for SSC magnet dependent systems.** Superconducting Super Collider Lab., Dallas, TX (United States). 15 Aug 1985. 114p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011076. Source: OSTI; NTIS; GPO Dep.

An SSC Cost Estimating Task Force was appointed by the SSC Director in May, 1985. The charge to the task force was to perform a detailed review of costs for all superconducting magnet design styles that are under consideration for the SSC. Cost information on five magnet styles was reviewed in detail by the task force members. The basic cost information was developed by participating laboratories and by industry. Details of the procedure and analysis are presented in Chapter III. The purpose of this report is to provide a comparison of all SSC construction project cost information that is dependent on the various magnet styles. It is emphasized that the costs displayed in the tables of this report are not the total costs for an SSC construction project. Only those systems for which costs vary with magnet style are included. In Appendix E, current results are compared with the relevant parts of the 1984 SSC Reference Designs Study (RDS) cost estimate. Following the method used in the RDS, the costs that are developed here are non-site specific. The labor rates utilized are based on a national average for the various labor categories. The Conventional Systems costs for underground structures are derived from an extension of the "median-site" model as described in the RDS.

21883 (SSC-SR–1015) **Report of the workshop on realistic SSC lattices.** Superconducting Super Collider Lab., Waxahachie, TX (United States). Oct 1985. 156p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-8505408–: Workshop on realistic SSC lattices, Berkeley, CA (United States), May - 4 jun 1985). Order Number DE95011078. Source: OSTI; NTIS; INIS; GPO Dep.

A workshop was held at the SSC Central Design Group from May 29 to June 4, 1985, on topics relating to the lattice of the SSC. The workshop marked a shift of emphasis from the investigation of simplified test lattices to the development of a realistic lattice suitable for the conceptual design report. The first day of the workshop was taken up by reviews of accelerator system requirements, of the reference design solutions for these requirements, of lattice work following the reference design, and of plans for the workshop. The work was divided among four working groups. The first, chaired by David Douglas, concerned the arcs of regular cells. The second group, which studied the utility insertions, was chaired by Beat Leemann. The third group, under David E. Johnson, concerned itself with the experimental insertions, dispersion suppressors, and phase trombones. The fourth group, responsible for global lattice considerations and the design of a new realistic lattice example, was led by Ernest Courant. The papers resulting from this workshop are roughly divided into three sets: those relating to specific lattice components, to complete lattices, and to other topics. Among the salient accomplishments of the workshop were additions to and optimization of lattice components, especially those relating to lattices using 1-in-1 magnets, either horizontally or vertically separated, and the design of complete lattice examples. Selected papers are indexed separately for inclusion in the Energy Science and Technology Database.

21884 (SSC-SR–1016) **SSC workshop on environmental radiation.** Lawrence Berkeley Lab., CA (United States). SSC Central Design Group. 9 Jan 1986. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-8510522–Summ.: SSC workshop on environmental radiation, Berkeley, CA (United States), 14-18 Oct 1985). Order Number DE95011079. Source: OSTI; NTIS; GPO Dep.

The Superconducting Super Collider is a 20 TeV-on-20 TeV proton beam collider where two 20-TeV proton accelerators whose beams, rotating in opposite senses, are brought into collision to provide 40 TeV in the center of mass. The scale of the project is set by the 6.6 tesla magnet guide field for the protons which results in a roughly circular machine with a circumference of 83 km (51.5 mi.). The energy scale of the proton beams and the physical scale of the machine are an order of magnitude greater than for any presently operating or contemplated proton accelerator yet the facility must be operated within the same strict radiological guidelines as existing accelerators in the US and Europe. To ensure that the facility conforms to existing and projected guidelines both in design and operation, the Workshop was charged to review the experience and practices of existing accelerator laboratories, to determine the relevant present and projected regulatory requirements, to review particle production and shielding data from accelerators and cosmic rays, to study the design and operational specifications of the Collider, to examine the parameters set forth in the Siting Parameters Document, and to evaluate the computational tools available to model the radiation patterns arising under various operational and failure scenarios. This report summarizes the extensive and intensive presentations and discussions of the Workshop. A great deal of material, much of it in the form of internal reports from the various laboratories and drafts of works in preparation, was provided by the participants for the various topics. This material, including the viewgraphs used by the presenters, forms the background and basis for the conclusions of the Workshop and, as such, is an important part of the Workshop. An introduction to the material and a catalog by topic are presented as section 6 of this report.

21885 (SSC-SR–1022) **An assessment of the antiproton-proton option for the SSC.** Superconducting Super Collider Lab., Dallas, TX (United States). May 1986. 125p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011084. Source: OSTI; NTIS; INIS; GPO Dep.

The Conceptual Design Report (CDR) for the Superconducting Super Collider (SSC) describes a proton-proton collider with an energy of 20 TeV per beam and a maximum luminosity of $10^{33}cm^{-2}s^{-1}$ per collision point. This directly responds to the recommendation made by the High Energy Physics Advisory Panel to the US Department of Energy and the National Science Foundation in July 1983. That recommendation called for the "immediate initiation of a multi-TeV high-luminosity proton-proton collider project with the goal of physics experiments at this facility at the earliest Possible date." The primary Parameters of the SSC in the Conceptual Design Report have been chosen taking account of both the physics discovery reach of the machine and accelerator physics considerations. The endeavor of the study reported here was to compare the feasibility of an antiproton-proton collider with the proton-proton collider presented in the SSC Conceptual Design Report. The rapid advances in the technology of $p\bar{p}$ colliders at CERN and Fermilab suggest that $p\bar{p}$ might be a viable alternative to a PP collider (or might be a first stage of an eventual $p\bar{p}$ collider). There is Potentially a large cost saving from eliminating one 20 TeV ring of magnets since the protons and antiprotons share the same ring. Following this suggestion, workshops at the University of Chicago and at Snowmass have provided a forum for these ideas. These reports formed the starting point for our study.

21886 (SSC-SR–1033) **Radiation levels in the SSC interaction regions.** Groom, D.E. (ed.). Lawrence Berkeley Lab., CA (United States). SSC Central Design Group. 10 Jun 1988. 344p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000 ; AC35-89ER40486. Order Number DE95011094. Source: OSTI; NTIS; GPO Dep.

The radiation environment in a typical SSC detector has been evaluated using the best available particle production models coupled with Monte Carlo simulations of hadronic and electromagnetic cascades. The problems studied include direct charged particle dose, dose inside a calorimeter from the cascades produced by incident photons and hadrons, the flux of neutrons and photons backscattered from the calorimeter into a central cavity, and neutron flux in the calorimeter. The luminosity lifetime at the SSC is dominated by collision losses in the interaction regions, where the luminosity is equivalent to losing an entire full-energy proton beam into the apparatus every six days. The result of an average p-p

collision can be described quite simply. The mean charged multiplicity is about 110, and the particles are distributed nearly uniformly in pseudorapidity (η) over all the angles of interest. The transverse momentum distribution is independent of angle, and for our purposes may be written as $p_\perp \exp(-p_\perp/\beta)$. The mean value of $p_\perp$ may be as high as 0.6 GeV/c. Most of the radiation is produced by the very abundant low-$p_\perp$ particles. The dose or neutron fluence produced by individual particles in this energy region are simulated over a wide variety of conditions, and several measurements serve to confirm the simulation results. In general, the response (a dose, fluence, the number of backscattered neutrons, etc.) for an incident particle of momentum p can be parameterized in the form Np^α, where $0.5 < \alpha < 1.0$. The authors believe most of their results to be accurate to within a factor of two or three, sufficiently precise to serve as the basis for detailed designs.

21887 (SSC-SR–1237) **Assessment of tunnel ground conditions for a two-year stand-by period, January 1994. UTAP report.** Superconducting Super Collider Lab., Dallas, TX (United States). 28 Jan 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011171. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes observations, assessment of ground conditions, and recommendations pertaining to the Collider main ring tunnel at the Superconducting Super Collider (SSC).

21888 (ANL/ASD/CP–85002) **Paraxial expansion of a static magnetic field in a ring accelerator.** Teng, L.C. Argonne National Lab., IL (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–181: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013409. Source: OSTI; NTIS; INIS; GPO Dep.

In the paraxial approximation, trajectories of beam particles in a ring accelerator are computed expanded in powers of lateral displacements and slopes from a closed reference orbit. To do this, one needs first the expanded expressions of the magnetic field and potentials producing the particle motion. This is derived here in a most general form.

21889 (ANL/ASD/CP–85013) **Effects of vertical aperture on beam lifetime at the Advanced Photon Source (APS) storage ring.** Bizek, H.M. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–170: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013416. Source: OSTI; NTIS; GPO Dep.

When a positron's energy deviation $\delta E/E$ exceeds the rf acceptance, or when it receives an angular kick for the betatron motion that exceeds some limiting admittance, the positron will be lost. The main contributions to the total beam lifetime come from single Coulomb and Touschek scattering. In this report we investigate the dependence of the residual gas pressure and the vertical aperture of the Advanced Photon Source storage ring on the total beam. lifetime. We present results of calculating the total beam lifetime as a function of vertical aperture for varying average ring pressure, beam current, and coupling coefficient.

21890 (ANL/ASD/CP–85027) **Effects of imperfections on the dynamic aperture and closed orbit of the IPNS Upgrade synchrotron.** Lessner, E.; Chae, Y.C.; Kim, S. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950512–161: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95012917. Source: OSTI; NTIS; INIS; GPO Dep.

Magnet imperfections and misalignments are analyzed in terms of their effects on the dynamic aperture and closed orbit of the IPNS Upgrade synchrotron. The dynamic aperture is limited primarily by the presence of chromaticity-correcting sextupoles. With the sextupoles energized to the values required to adjust the chromaticities to zero, further reductions of the dynamic aperture caused by dipole strength and roll errors, quadrupole strength and alignment errors, and higher-order multipole errors are studied by tracking. Design specifications for the dipole corrector magnets are obtained and the dynamic aperture is studied before and after correction of the closed orbit. The use of harmonic-correcting sextupoles to reduce the amplitude-dependent tune shifts driven by the chromaticity-correcting sextupoles is investigated.

21891 (ANL/ASD/CP–85054) **Reduction of open-loop low frequency beam motion at the APS.** Decker, G. (and others); Kang, Y.G.; Kim, S. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950512–208: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013529. Source: OSTI; NTIS; GPO Dep.

The Advanced Photon Source (APS) 7-GeV positron storage ring at Argonne National Laboratory (ANL) produces high brilliance bending magnet and insertion device x-rays for up to 70 x-ray beamlines. To efficiently make use of the storage ring's high brilliance, an extremely tight tolerance has been placed on positron beam stability, namely that the beam be stable to a level which is less than 5% of its rms size. This requirement amounts to ± 4.4 microns rms in the vertical plane and ± 17 microns horizontally, assuming 10% coupling. While real-time closed orbit feedback (discussed elsewhere in these proceedings) will be employed to exceed the required stability requirement, efforts are underway to identify and reduce sources of beam motion in the absence of feedback. These sources include ground- and water-system-induced vibrations in addition to power supply jitter and drift. Results to date of this effort will be presented.

21892 (ANL/PHY/CP–85477) **A concept for emittance reduction of DC radioactive heavy-ion beams.** Nolen, J.A.; Dooling, J.C. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950512–209: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013533. Source: OSTI; NTIS; INIS; GPO Dep.

Numerical simulations indicate that it should be possible to use an electron beam to strip 1+ DC radioactive ion beams to 2+ or higher charge states with on the order of 50% efficiency. The device, which the authors call an Electron-Beam Charge-State Amplifier, is similar to an Electron Beam Ion Source, except that it is not pulsed, the beams are continuous. The 2+ beams are obtained in a single pass through a magnetic solenoid while higher charge states may be reached via multiple passes. An unexpected result of the ion optics simulations is that the normalized transverse emittance of the ion beam is reduced in proportion to the charge-state gain. Ion beams with realistic emittances and zero angular momentum relative to the optic axis before entering the solenoid will travel though the solenoid on helical orbits which intercept the axis once per cycle. With an ion beam about 2 mm in diameter and an electron beam about 0.2 mm in diameter, the ion stripping only occurs very near the optic axis, resulting in the emittance reduction.

21893 (BNL–52435, pp. 109-120) **Design, simulation and visualization of ultrafast electron optical devices.** Rose-Petruck, C. (Univ. of California, La Jolla, CA (United States)); Wilson, K.R. Brookhaven National Lab., Upton, NY (United States). [1994]. (CONF-9405276–: Lasers for RF guns, Anaheim, CA (United States), 14-15 May 1994). In *Lasers for RF guns: Proceedings*. 153p. Order Number DE95004856. Source: OSTI; NTIS; INIS; GPO Dep.

Ultrashort electron pulses can in principle be used for measuring the motions of atoms in material samples by electron diffraction. Alternatively, ultrafast diffraction with x-ray pulses could be used for measuring molecular dynamics in condensed phase samples. One way to produce ultrafast x-ray pulses is from ultrafast electron pulses, in an x-ray diode. In order to design such ultrafast electron and x-ray sources, which involve electron trajectories in the presence of space-charge, the authors have developed a simulation and visualization system for charged particle trajectories in electric

and magnetic fields. In the first section they discuss the newly developed software package for simulating and visualizing charged particle optics. In the second section they briefly characterize various techniques to generate ultrashort x-ray pulses. As an illustration, they present simulation results for an x-ray diode with a laser driven photocathode.

21894 (BNL–52461) **Numerical studies of Siberian snakes and spin rotators for RHIC.** Luccio, A. Brookhaven National Lab., Upton, NY (United States). 17 Apr 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95012228. Source: OSTI; NTIS; INIS; GPO Dep.

For the program of polarized protons in RHIC, two Siberian snakes and four spin rotators per ring will be used. The Snakes will produce a complete spin flip. Spin Rotators, in pairs, will rotate the spin from the vertical direction to the horizontal plane at a given insertion, and back to the vertical after the insertion. Snakes, 180° apart and with their axis of spin precession at 90° to each other, are an effective means to avoid depolarization of the proton beam in traversing resonances. Classical snakes and rotators are made with magnetic solenoids or with a sequence of magnetic dipoles with fields alternately directed in the radial and vertical direction. Another possibility is to use helical magnets, essentially twisted dipoles, in which the field, transverse the axis of the magnet, continuously rotates as the particles proceed along it. After some comparative studies, the authors decided to adopt for RHIC an elegant solution with four helical magnets both for the snakes and the rotators proposed by Shatunov and Ptitsin. In order to simplify the construction of the magnets and to minimize cost, four identical super conducting helical modules will be used for each device. Snakes will be built with four right-handed helices. Spin rotators with two right-handed and two left-handed helices. The maximum field will be limited to 4 Tesla. While small bore helical undulators have been built for free electron lasers, large super conducting helical magnets have not been built yet. In spite of this difficulty, this choice is dictated by some distinctive advantages of helical over more conventional transverse snakes/rotators: (i) the devices are modular, they can be built with arrangements of identical modules, (ii) the maximum orbit excursion in the magnet is smaller, (iii) orbit excursion is independent from the separation between adjacent magnets, (iv) they allow an easier control of the spin rotation and the orientation of the spin precession axis.

21895 (BNL–61188) **BBAT: Bunch and bucket analysis tool.** Deng, D.P. Brookhaven National Lab., Upton, NY (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950512–138: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95011807. Source: OSTI; NTIS; INIS; GPO Dep.

BBAT is written to meet the need of an interactive graphical tool to explore the longitudinal phase space. It is driven for testing new ideas or new tricks quickly. It is especially suitable for machine physicists or operation staff as well both in the control room during machine studies or off-line to analyze the data. The heart of the package contains a set of c-routines to do the number crunching. The graphics part is wired with scripting language tcl/tk and BLT. The c-routines are general enough that one can write new applications such as animation of the bucket as a machine parameter varies via a sliding scale. BBAT deals with single rf system. For double rf system, one can use Dr. BBAT, which stands for Double rf Bunch and Bucket Analysis Tool. One usage of Dr. BBAT is to visualize the process of bunch coalescing and flat bunch creation.

21896 (BNL–61189) **Rebucketing after transition in RHIC.** Deng, D.P.; Peggs, S. Brookhaven National Lab., Upton, NY (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950512–142: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95011815. Source: OSTI; NTIS; INIS; GPO Dep.

Rebucketing in the Relativistic Heavy Ion Collider, RHIC, describes the process of moving the beam from the 26MHz accelerating system to the 196MHz storage system with as little beam loss as possible. This puts a stringent requirement on the beam longitudinal area done at top energy. The ample bucket space after, but not too close to, transition is explored by computer simulation to relax such stringent conditions.

21897 (BNL–61496) **Phenomenology of crystalline beams in smooth accelerators.** Haffmans, A.F.; Maletic, D.; Ruggiero, A.G. Brookhaven National Lab., Upton, NY (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950512–215: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013509. Source: OSTI; NTIS; INIS; GPO Dep.

We present a phenomenology of crystalline beams in storage rings. We use the smooth approximation to solve the equations of a test particle moving in the focussing potential of the storage ring, and in that of the other ions We find simple confinement, and stability conditions.

21898 (BNL–61527) **Beam dynamics group summary.** Peggs, S. Brookhaven National Lab., Upton, NY (United States). [1994]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9410315–3: Collective effects in large hadron collider, Montreux (Switzerland), 17-22 Oct 1994). Order Number DE95008865. Source: OSTI; NTIS; INIS; GPO Dep.

This paper summarizes the activities of the beam dynamics working group of the LHC Collective Effects Workshop that was held in Montreux in 1994. It reviews the presentations that were made to the group, the discussions that ensued, and the consensuses that evolved.

21899 (BNL–61788) **Damping rates of the SRRC storage ring.** Hsu, K.T. (Synchrotron Radiation Research Center, Hsinchu (Taiwan, Province of China)); Kuo, C.C.; Lau, W.K.; Weng, W.T. Brookhaven National Lab., Upton, NY (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950512–125: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95012315. Source: OSTI; NTIS; INIS; GPO Dep.

The SRRC storage ring is a low emittance synchrotron radiation machine with nominal operation energy 1.3 GeV. The design damping time due to synchrotron radiation is 10.7, 14.4, 8.7 ms for the horizontal, vertical and longitudinal plane, respectively. The authors measured the real machine damping time as a function of bunch current, chromaticity, etc. To damp the transverse beam instability, especially in the vertical plane, they need to increase chromaticity to large positive value. The damping rates are much larger than the design values. Landau damping contribution in the longitudinal plane is quite large, especially in the multibunch mode. The estimated synchrotron tune spread from the Landau damping is in agreement with the measured coherent longitudinal coupled bunch oscillation amplitude.

21900 (CEA-LNS-SAF–94-22) **Tools for the design of high-current linacs.** Lagniel, J.M. Laboratoire National Saturne, Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). 1994. 3p. (CONF-9408125–: 17. international LINAC conference, Tsukuba (Japan), 21-26 Aug 1994). Order Number DE95632423. Source: OSTI; NTIS (US Sales Only); INIS.

With the programs usually employed to design linear accelerators, beam dynamics parameters are calculated from data describing the accelerator structure. The desired phase advances (with and without space charge) in the transverse and longitudinal planes are reached after several iterations on the structure parameters. Codes which use the opposite procedure have been written. The phase advances are first chosen thanks to a diagram which gives the tune depressions versus the phase advances without space charge. The structure parameters are then calculated. As shown, it can be applied to radiofrequency quadrupoles (RFQ), DTL and high-energy structures. Up to now, this method has been mainly used to design RFQ linear accelerators. 3 figs., 10 refs.

21901 (DOE/ER/54177–T2) **Half-year progress report FY92/93 NRL HIFAR research program, August 1, 1992–June 31, 1993.** Naval Research Lab., Washington, DC (United States). [1995]. 78p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI05-92ER54177. Order Number DE95014302. Source: OSTI; NTIS; INIS; GPO Dep.

Progress during this reporting period has been in several areas. The research effort has continued in close collaboration with personnel at LBL and LLNL. In addition, studies of the longitudinal physics, which are jointly supported by the Division of High Energy Physics of the U.S. Department of Energy, have benefitted from collaboration with personnel at the University of Maryland associated with the Maryland transport experiment. The research results supported by this program have been, and will be, actively reported to the scientific community through papers presented at conferences and published in conference proceedings as well as in the refereed literature. The first of these references describe work primarily supported under the current contract, while the remaining references describe work jointly supported by the Division of High Energy Physics. Progress detailed in these manuscripts, currently in preparation, will be included in a later report. The emphasis below is instead concentrated on reporting work, in cooperation with LBL, on the simulation of large aperture quadrupoles, with a further emphasis on the NRL contribution. This work is concentrated on understanding the basic nonlinear physics which is important to the design of large aperture magnetic quadrupoles, as well as the numerical requirements for reliable simulations of that physics. In particular, comparisons between the SHIFT-XY and HIFI simulation codes are presented to determine the conditions under which the HIFI code, which is faster running, but is generally run using less accuracy in the space charge model than SHIFT-XY, can be appropriately employed.

21902 (FNAL/C–95/097) **Calculating luminosity for a coupled Tevatron lattice.** Holt, J.A.; Martens, M.A.; Michelotti, L.; Goderre, G. Fermi National Accelerator Lab., Batavia, IL (United States). May 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-950512–159: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013005. Source: OSTI; NTIS; INIS; GPO Dep.

The traditional formula for calculating luminosity assumes an uncoupled lattice and makes use of one-degree-of-freedom lattice functions, β_H and β_V, for relating transverse beam widths to emittances. Strong coupling requires changing this approach. It is simplest to employ directly the linear normal form coordinates of the one turn map. An equilibrium distribution in phase space is expressed as a function of the Jacobian's eigenvectors and beam size parameters or emittances. Using the equilibrium distributions an expression for the luminosity was derived and applied to the Tevatron lattice, which was coupled due to a quadrupole roll.

21903 (FNAL/C–95/098) **Microwave stability at transition.** Holt, J.A.; Colestock, P.L. Fermi National Accelerator Lab., Batavia, IL (United States). May 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-950512–160: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013004. Source: OSTI; NTIS; INIS; GPO Dep.

The question of microwave stability at transition is revisited using a Vlasov approach retaining higher order terms in the particle dynamics near the transition energy. A dispersion relation is derived which can be solved numerically for the complex frequency in terms of the longitudinal impedance and other beam parameters. Stability near transition is examined and compared with simulation results.

21904 (FNAL/C–95/104) **Mode-coupling instability and bunch lengthening in proton machines.** Ng, K.Y. Fermi National Accelerator Lab., Batavia, IL (United States). May 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-950512–211: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013244. Source: OSTI; NTIS; INIS; GPO Dep.

In proton machines, potential-well distortion leads to small amount of bunch lengthening with minimal head-tail asymmetry. Longitudinal mode-mixing instability occurs at higher azimuthal modes. When the driving resonance is of broad-band, the threshold corresponds to Keil-Schnell criterion for microwave instability. When the driving resonance is narrower than the bunch spectrum, the threshold corresponds to a similar criterion derived before.

21905 (FNAL/C–95/122) **Simulations of transition crossing in the main injector.** Bhat, C.M.; MacLachlan, J.A. Fermi National Accelerator Lab., Batavia, IL (United States). May 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-950512–158: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95012972. Source: OSTI; NTIS; INIS; GPO Dep.

The design goal for the Fermilab Main Injector (FMI) is to accelerate a minimum of 6×10^{10} protons per bunch through the transition. We present here the results from simulation studies of the transition crossing in the FMI using the particle tracking code ESME.

21906 (INIS-RU–405, pp. 382-386) **Code spin Lie - the code for calculation of polarization in collider using Lie operators method.** Eidelman, Yu. (AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki); Yakimenko, V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 460p. (CONF-9109331–: 4. workshop on high energy spin physics, Protvino (USSR), 3 Sep 1991). In *IV. Workshop on High Energy Spin Physics.* Order Number DE95632424. Source: OSTI; NTIS (US Sales Only); INIS.

The computer code Spin Lie base on Lie operators for calculation the equilibrium degree of beam polarization in storage rings taking into account the linear resonance. Spin Lie possibility to calculate the dependence of spin-orbit resonances on orbit distortion is shown. 14 refs.

21907 (INIS-RU–405, pp. 413-437) **Problems of using polarization effects in e,γ interactions with monocrystals in spin high-energy physics.** Maisheev, V.A.; Mikhalev, V.L.; Frolov, A.M. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 460p. (In Russian). (CONF-9109331–: 4. workshop on high energy spin physics, Protvino (USSR), 3 Sep 1991). In *IV. Workshop on High Energy Spin Physics.* Order Number DE95632424. Source: OSTI; NTIS (US Sales Only); INIS.

Some perspective directions of experimental investigations if polarized effects in e,γ-interactions with monocrystals are outlined. Practical applications of these effects in spin high-energy physics for polarized e,γ-beams production together with measurement of beam polarization are considered. 24 refs.; 20 figs.

21908 (LA-UR–95-1547) **Electric fields, electron production, and electron motion at the stripper foil in the Los Alamos Proton Storage Ring.** Plum, M. Los Alamos National Lab., NM (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950512–147: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95011979. Source: OSTI; NTIS; INIS; GPO Dep.

The beam instability at the Los Alamos Proton Storage Ring (PSR) most likely involves coupled oscillations between electrons and protons. For this instability to occur, there must be a strong source of electrons. Investigation of the various sources of electrons in the PSR had begun. Copious electron production is expected in the injection section because this section contains the stripper foil. This foil is mounted near the center of the beam pipe, and both circulating and injected protons pass through it, thus allowing ample opportunity for electron production. This paper discusses various mechanisms for electron production, beam-induced electric fields, and electron motion in the vicinity of the foil.

21909 (LBL–36842) **Heavy ions acceleration in RF wells of 2-frequency electromagnetic field and in the inverted FEL.** Dzergach, A.I.; Kabanov, V.S.; Nikulin, M.G.; Vinogradov, S.V. Lawrence Berkeley Lab., CA (United States). Mar 1995. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95012439. Source: OSTI; NTIS; INIS; GPO Dep.

Last results of the study of heavy ions acceleration by electrons trapped in moving 2-frequency 3-D RF wells are described. A linearized theoretical model of ions acceleration in a polarized spheroidal plasmoid is proposed. The equilibrium state of this plasmoid is described by the modified microcanonical distribution of the Courant-Snyder invariant ("quasienergy" of electrons). Some new

results of computational simulation of the acceleration process are given. The method of computation takes into account the given cylindrical field $E_{011}(\varphi,r,z)$ and the self fields of electrons and ions. The results of the computation at relatively short time intervals confirm the idea and estimated parameters of acceleration. The heavy ion accelerator using this principle may be constructed with the use of compact cm band iris-loaded and biperiodical waveguides with double-sided 2-frequency RF feeding. It can accelerate heavy ions with a charge number Z_i from small initial energies $\sim$ 50 keV/a.u. with the rate $\sim Z_i \cdot 10$ MeV/m. Semirelativistic ions may be accelerated with similar rate also in the inverted FEL.

21910 (LBL–36843) **Investigation of focusing of relativistic electron and positron bunches moving in cold plasma. Final report.** Amatuni, A.Ts.; Elbakian, S.S.; Khachatryan, A.G.; Sekhpossian, E.V. Lawrence Berkeley Lab., CA (United States). Mar 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95012441. Source: OSTI; NTIS; INIS; GPO Dep.

This document is the final report on a project to study focusing effects of relativistic beams of electrons and positrons interacting with a cold plasma. The authors consider three different models for the overdense cold plasma - electron bunch interaction. They look at coulomb effects, wakefield effects, bunch parameters, and the effects of trains of pulses on focusing properties.

21911 (LBL–37050) **The beam envelope equation-systematic solution for a periodic quadrupole lattice with space charge.** Lee, E.P. Lawrence Berkeley Lab., CA (United States). Apr 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95012761. Source: OSTI; NTIS; INIS; GPO Dep.

Many approximate solutions for matched beam envelope functions with space charge have been developed; they generally have errors of 2-10% for the parameters of interest and cannot be reliably improved. The new, systematic approach described here provides the K-V envelope functions to high accuracy as a power series in the quadrupole gradient. A useful simplification results from defining the sum and difference of the envelope radii; S = (a+b)/2 varies only slightly with distance z along the system axis, and D = (a-b)/2 contains most of the envelope oscillations. To solve the coupled equations for S and D, the quadrupole strength K(z) is turned on by replacing K with αK_1 and letting α increase continuously from 0 to 1. It is found that S and D may be expanded in even and odd powers of α, respectively. Equations for the coefficients of powers of α are then solved successively by integration in z. The periodicity conditions and tune integration close the calculation. Simple low order results are typically accurate to 1% or better.

21912 (SLAC–451, pp. 465-491) **INP studies for a Tau-Charm Factory.** Skrinsky, A. (Budker INP, Novosibirsk (Russian Federation)). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Oct 1994. (CONF-9408190–: Tau-Charm factory in the era of B-factories and CESR conference, Stanford, CA (United States), 15-16 Aug 1994). In *The Tau-Charm Factory in the ERA of B-Factories and CESR.* 763p. Order Number DE95007894. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents the results of studies undertaken at INP of options for a Tau Charm Factory. Three different beam options have been studied. First is a 'round beam option', allowing axially symmetric beams which yield high tau-pair productivity. The second option involves monochromatic beams, which enhances productivity for narrow $c\bar{c}$ states, gives good tau pair productions in a clean manner, and has a good resonant-to-nonresonant ratio. The third option allows longitudinal polarization, should it prove to be interesting. It is an easy option to implement because it only involves polarized electrons. Work on some of these options is described in terms of experiments on the VEPP-2 device.

21913 (SLAC–451, pp. 593-615) **Polarized beams at SPEAR and Tau-Charm Factory.** Prepost, R. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Oct 1994. (CONF-9408190–: Tau-Charm factory in the era of B-factories and CESR conference, Stanford, CA (United States), 15-16 Aug 1994). In *The Tau-Charm Factory in the ERA of B-Factories and CESR.* 763p. Order Number DE95007894. Source: OSTI; NTIS; INIS; GPO Dep.

The author discusses the issue of polarized beams at storage rings, and what impact this might have on a tau charm factory. Radiative polarization in a storage ring is discussed, and compared with results observed in SPEAR. Depolarization results and theories are then discussed also. Simulation codes developed to study spin depolarization in a storage ring are discussed, as well as hardware to accomplish spin rotation in the machines. The implications of all of these concerns for the physics potential of a tau charm factory are discussed.

21914 (SLAC-PUB–95-6792) **A fast beam-ion instability.** Zimmermann, F.; Raubenheimer, T.O.; Stupakov, G. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jun 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-950512–197: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95014656. Source: OSTI; NTIS; INIS; GPO Dep.

Mutually driven transverse oscillations of an electron beam and residual gas ions may result in a fast transverse instability. This effect arises either during a single pass of a train of electron bunches or it is caused by ionization electrons oscillating within a single positron bunch. In both cases, the beam oscillations grow exponentially with an exponent proportional to the square root of time. In this report, instability rise times are calculated analytically and compared with computer simulations. The effect considered could be a significant limitation in many future designs.

21915 (SLAC-PUB–95-6804) **Study of beam decoherence in the presence of head-tail instability using a two-particle model.** Stupakov, G.V.; Chao, A.W. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jun 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-950512–187: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95014649. Source: OSTI; NTIS; INIS; GPO Dep.

The decoherence behavior of a beam centroid motion after a kick is studied using a two-particle model. A simple theory based on averaging of the governing equation is developed. The effects of a finite chromaticity and synchrotron motion are taken into account. Increasing the tune spread in the beam, a transition from a head-tail instability to a stable decay of an initial kick is explicitly demonstrated.

21916 (SLAC-PUB–95-6850) **Beam distribution function after filamentation.** Raubenheimer, T.O.; Decker, F.J.; Seeman, J.T. Stanford Linear Accelerator Center, Menlo Park, CA (United States). May 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-950512–135: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013280. Source: OSTI; NTIS; INIS; GPO Dep.

In this paper, the authors calculate the beam distribution function after filamentation (phase-mixing) of a focusing mismatch. This distribution is relevant when interpreting beam measurements and sources of emittance dilution in linear colliders. It is also important when considering methods of diluting the phase space density, which may be required for the machine protection system in future linear colliders, and it is important when studying effects of trapped ions which filament in the electron beam potential. Finally, the resulting distribution is compared with measured beam distributions from the SLAC linac.

21917 (SLAC-PUB–95-6881) **Polarization correlations in the SLC final focus.** Decker, F.J. Stanford Linear Accelerator Center, Menlo Park, CA (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-950512–99: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95010742. Source: OSTI; NTIS; INIS; GPO Dep.

At the SLC, the electron beam polarization (P) is measured by a Compton polarimeter downstream of the Interaction Point. This measurement averages over the entire beam distribution and must be corrected for various correlations to calculate the luminosity (L) weighted polarization. Because the spin rotation in the ARC is energy dependent, off energy particles have lower polarization. These particles may also be poorly focused and contribute less luminosity

due to the higher order chromatic optics of the final focus. The small vertical β function at the interaction point also causes an hour-glass effect, where particles at the head and tail of the bunch have less luminosity. Since there is an energy-z correlation due to the compensation of longitudinal wakefields in the linac, these particles may also have lower polarization. The correlations are: z <-> E (linac), E <-> P (ARC), z <-> L (hour-glass) and E <-> L (chromaticity). The contributions from the z <-> E and z <-> L correlations are discussed.

21918 (SLAC-PUB–95-6888) **A map for the thick beam-beam interaction.** Irwin, J.; Chen, T. Stanford Linear Accelerator Center, Menlo Park, CA (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-950512–96. Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95012561. Source: OSTI; NTIS; INIS; GPO Dep.

The authors give a closed-form expression for the thick beam-beam interaction for a small disruption parameter, as typical in electron-positron storage rings. The dependence on transverse angle and position of the particle trajectory as well as the longitudinal position of collision and the waist-modified shape of the beam distribution are included. Large incident angles, as are present for beam-halo particles or for large crossing-angle geometry, are accurately represented. The closed-form expression is well approximated by polynomials times the complex error function. Comparisons with multi-slice representations show even the first order terms are more accurate than a five slice representation, saving a factor of 5 in computation time.

21919 (SLAC-PUB–95-6905) **Beam trajectory jitter in the SLC linac.** Adolphsen, C.; Slaton, T. Stanford Linear Accelerator Center, Menlo Park, CA (United States). May 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-950512–133: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013282. Source: OSTI; NTIS; INIS; GPO Dep.

We present model-independent measurements of the vertical trajectory jitter of the positron beam in the Stanford Linear Collider (SLC) linac and discuss the results of studies aimed at isolating its source.

21920 (SSC–155) **Beam-beam stability in the SSC. A preliminary report.** Tennyson, J.L. Superconducting Super Collider Lab., Dallas, TX (United States). Jan 1988. 76p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE95011175. Source: OSTI; NTIS; GPO Dep.

The stability of proton orbits in the SSC is threatened by two principle elements in the beam system: magnet errors and the beam-beam interaction. Of these, magnet errors are considered to be of greater importance because they are more tenacious. Beam-beam effects can be reduced if necessary by widening the beam crossing angle. Magnet errors, however, cannot be removed and their effects are difficult to compensate for. The stability of the beam system is characterized by a curve in the two-dimensional amplitude plane which separates dynamically stable trajectories, at small amplitudes, from dynamically unstable trajectories, at large amplitudes. The area of stable motion is refered to here as the "stability aperture". Protons outside the stability aperture exhibit chaotic motion and are lost rapidly from the beam. Those inside the aperture, in the absence of single particle scattering, remain confined indefinitely. Although the edge of the stability aperture is not a "fine line", as it would be for a one-degree-of-freedom system with time dependence, the amplitudes representing the transition from stable to unstable motion are fairly well defined in the SSC. The primary purpose of this investigation is to roughly determine the size and shape of the stability aperture induced by the beam-beam interaction alone, and its dependence on the principle machine parameters. This information, together with a determination of the magnet error aperture and the combined total aperture, is needed to select the nominal beam crossing angle.

21921 (SSCL–260) **The effect of magnetic peaking on the dynamic aperture.** Garavaglia, T.; Stiening, R. Superconducting Super Collider Lab., Dallas, TX (United States). Mar 1990. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011178. Source: OSTI; NTIS; INIS; GPO Dep.

It has been suggested that the dynamic aperture of the SSC can be increased by a suitable choice of the dipole systematic allowed multipole moments so as to extend the uniform field region of the magnet. In this note the effect of combinations of B_4 and B_6 are considered on the tune shifts. These tune shifts have been calculated using the methods of different authors. The results of these calculations are given.

21922 (SSCL–508) **Growth rate in terms of Z⊥.** Briggs, D. Superconducting Super Collider Lab., Dallas, TX (United States). Sep 1991. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011145. Source: OSTI; NTIS; INIS; GPO Dep.

This report briefly discusses the beam emittance growth rate in terms of transverse impedance.

21923 (SSCL–641) **Transient effect in high intensity proton linear accelerators.** Senichev, Yu. Superconducting Super Collider Lab., Dallas, TX (United States). Sep 1993. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011184. Source: OSTI; NTIS; INIS; GPO Dep.

We study the possible mechanism of the separatrix destruction during the transient in the linear accelerator. This effect is due to the parametric resonance of the beam in the longitudinal plane caused by the perturbations of electromagnetic field. The magnitude of time-space perturbations of the electromagnetic field depends on the disperse feature of resonator and the beam intensity. In the paper we discuss how to avoid this effect or to decrease its influence.

21924 (SSCL–650) **Calculation of the coupling impedances of holes and slots on the liner using MAFIA and scaling.** Thiagarajan, V.; Barts, T.; Kurennoy, S.; Chou, W. Superconducting Super Collider Lab., Dallas, TX (United States). Nov 1993. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011252. Source: OSTI; NTIS; INIS; GPO Dep.

The location of a liner inside the beam tube is one of the options considered for the Super Colliders. The liner could serve as a synchrotron radiation intercept and also help enhance the vacuum. A definite distribution of holes or slots is required to be located on the liner for pumping out the desorbing gases. There will be wake fields propagating within the liner due to diffraction at discontinuities following the incident beam fields. The effect of these wake fields can be minimized by adopting the least number of pumping holes/slots required and through an optimal choice of hole/slot shape and size. The effect of the wake fields on the beam may be expressed through coupling impedances defined proportional to the corresponding forces integrated through distance per unit charge. It is necessary to compute the impedance of holes and slots and determine the scaling of the impedance with the dimensions of the hole/slot and the liner, in order to optimize the choice of pumping holes/slots. The coupling impedances of slots and holes have been calculated here using the code MAFIA and the scaling assessed. The results compare favorably with existing analytical results.

21925 (SSCL-Preprint–14) **Perturbation approach and the constant of motion for on-dimensional dynamical systems.** Lopez, G. Superconducting Super Collider Lab., Dallas, TX (United States). Nov 1991. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011256. Source: OSTI; NTIS; INIS; GPO Dep.

A perturbation technic is used to find the constant of motion of a one-dimensional autonomous system. The convergence of the method is discussed through some examples. In addition, the approach is extended to one-dimensional non-autonomous systems where some examples are given.

21926 (SSCL-Preprint–182) **Synchrotron radiation from protons.** Dutt, S.K. Superconducting Super Collider Lab., Dallas, TX (United States). Dec 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486.

(CONF-9202111–8: 4. generation light sources workshop, Stanford, CA (United States), 24-27 Feb 1992). Order Number DE95011109. Source: OSTI; NTIS; INIS; GPO Dep.

Synchrotron radiation from protons, though described by the same equations as the radiation from electrons, exhibits a number of interesting features on account of the parameters reached in praxis. In this presentation, we shall point out some of the features relating to (i) normal synchrotron radiation from dipoles in proton machines such as the High Energy Booster and the Superconducting Super Collider; (ii) synchrotron radiation from short dipoles, and its application to light monitors for proton machines, and (iii) synchrotron radiation from undulators in the limit when, the deflection parameter is much smaller than unity. The material for this presentation is taken largely from the work of Hofmann, Coisson, Bossart, and their collaborators, and from a paper by Kim. We shall emphasize the qualitative aspects of synchrotron radiation in the cases mentioned above, making, when possible, simple arguments for estimating the spectral and angular properties of the radiation. Detailed analyses can be found in the literature.

21927 (SSCL-Preprint–188) **Emittance growth due to noise and its suppression with the Feedback system in large hadron colliders.** Lebedev, V. (Budker Institute of Nuclear Physics, Novosibirsk, (Russian Federation)); Parkhomchuk, V.; Shiltsev, V.; Stupakov, G. Superconducting Super Collider Lab., Dallas, TX (United States). Mar 1993. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011110. Source: OSTI; NTIS; INIS; GPO Dep.

The problem of emittance growth due to random fluctuation of the magnetic field in hadron colliders is considered. Based on a simple one-dimensional linear model, a formula for an emittance growth rate as a function of the noise spectrum is derived. Different sources of the noise are analyzed and their role is estimated for the Superconducting Super Collider (SSC). A theory of feedback suppression of the emittance growth is developed which predicts the residual growth of the emittance in the accelerator with a feedback system.

21928 (SSCL-Preprint–239) **Emittance growth due to power ripple in a hadron collider.** Stupakov, G.V. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011113. Source: OSTI; NTIS; INIS; GPO Dep.

Emittance growth of the beam caused by power supply ripple in the Superconducting Super Collider (SSC) is studied. We find that due to nonlinear terms in the equation of the betatron oscillations, the emittance grows only during an initial transient period, after which its increase saturates at some level. An analytical formula is derived that gives the fractional increase of the emittance as a function of the amplitude of the ripple. Numerical estimates for the SSC are presented.

21929 (SSCL-Preprint–332) **A new method for calculation of low-frequency coupling impedance.** Kurennoy, S.S.; Stupakov, G.V. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011122. Source: OSTI; NTIS; INIS; GPO Dep.

In high-energy proton accelerators and storage rings the bunch length is typically at least a few times larger than the radius of the vacuum chamber. For example, the SSC will have an rms bunch length above 6 cm and a beam-pipe radius below 2 cm. The main concern for beam stability in such a machine is the low-frequency impedance, i.e., the coupling impedance at frequencies wen below the cut-off frequency of the vacuum chamber. In the present paper we develop a new analytical approach for calculation of the low-frequency impedance of axisymmetric structures that allows us to give quick and reliable estimates of contributions to the impedance from various chamber discontinuities. Simple formulae for the longitudinal impedance of some typical discontinuities are obtained.

21930 (SSCL-Preprint–539) **Emittance growth saturation effect in synchrotron machines due to point-like perturbations.** Lopez, G.; Chen, S. Superconducting Super Collider Lab., Dallas, TX (United States). Nov 1993. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011029. Source: OSTI; NTIS; INIS; GPO Dep.

Analytical estimation of the transverse emittance growth due to a point-like perturbation is performed for a proton synchrotron machine. This emittance growth is caused by the tune spread within the bunch. However, the emittance growth suffers a saturation effect caused by the same tune spread. Computer simulations on the emittance growth due to resistive wall instabilities and feedback systems verify qualitatively this emittance growth saturation effect. These simulations were accomplished in the Medium Energy Booster of the Superconducting Super Collider using the TADIMMI computer code.

21931 (SSCL-Preprint–543) **Constant of motion for a one-dimensional and nth-order autonomous system and its relation to the Lagrangian and Hamiltonian.** Lopez, G. Superconducting Super Collider Lab., Dallas, TX (United States). Dec 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011153. Source: OSTI; NTIS; INIS; GPO Dep.

A constant of motion is defined for a one-dimensional and nth-differenital-order autonomous svstem. A generalization of the Legendre transformation is given that allows one to obtain a relation among the constant of motion the Lagrangian, and the Hamiltonian. The approach is used to obtain the constant of motion associated with the nonrelativistic third-differential-order Abraham-Lorentz radiation damping equation.

21932 (SSCL-Preprint–561-Rev.1) **Collective behavior of an ensemble of forced duffing oscillators near the 1:1 resonance. Revision 1.** Sen, T.; Ellison, J.; Kauffmann, S. Superconducting Super Collider Lab., Dallas, TX (United States). Jul 1994. 65p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011159. Source: OSTI; NTIS; INIS; GPO Dep.

Preserving the beam size (or equivalently the emittance) is a primary aim of accelerator physics. Here we study the effect on the emittance of power supply ripple in the guiding magnetic fields. The collective behavior of forced Duffing oscillators is the natural model to understand this phenomenon. We consider the case when the external frequency is near the linearized natural frequency and nonlinearity and forcing are small. The method of averaging reduces the problem to an autonomous system. A coarse grained long time limit of the phase space density and the rate of approach to this limit are discussed in terms of the autonomous system. We find the frequencies which lead to the largest emittance growth in three different forcing regimes (weak, moderate and relatively large) and also characterize the dependence of emittance growth on forcing amplitude in these regimes.

21933 (SSCL-SR–1038) **Compendation of SSC lattice optics in the presence of dipole field errors: Report of the Correction Element Working Group.** Bintinger, D. (and others); Chao, A.; Forest, E. Superconducting Super Collider Lab., Dallas, TX (United States). Feb 1989. 110p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011791. Source: OSTI; NTIS; GPO Dep.

The assignment of the Correction Element Working Group (CEWG) is to advance the designs of various candidate correction schemes to a point where they can be compared and distilled down to a single plan. Choosing among, the options often involves consideration of incommensurate factors such as cost, practicality, and theoretical performance. Except for minor issues, the CEWG purpose is to gather and array the facts in a form from which these decisions can be rationally made, but not to make the decisions. The present report analyses various schemes for compensating nonlinear multipole errors in the main arc dipoles of the Superconducting Super Collider. Emphasis is on comparing lumped and distributed compensation, on minimizing the total number of correction elements, and on reducing the sensitivity to closed-orbit errors.

21934 (SSCL-SR–1227) **Eighth International Magnetic Measurement Workshop (IMMW-8) presentations.** Superconducting Super Collider Lab., Dallas, TX (United States). Sep 1993. 738p.

Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-9309489–: 8. international magnetic measurement workshop, Waxahachie, TX (United States), 27-30 Sep 1993). Order Number DE95011167. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains viewgraphs on magnetic field measurements conducted at the superconducting super collider and other accelerators.

21935 (SSC-SR–1014) **The clustered interaction region option for the SSC.** Superconducting Super Collider Lab., Dallas, TX (United States). 30 Sep 1985. 85p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011077. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains discussions on the following topics: advantages of clustering IR's for conventional facilities; theoretical consideration of optics issues; chromatic properties of test lattices; lattice designs including utility insertions; background and test beam calculations; and beam-beam effects.

4303 Auxiliaries and Components

21936 (ANL/ASD/CP–84873) **Design, construction, and procurement methodology of magnets for the 7-GeV Advanced Photon Source.** Gorski, A. (and others); Argyrakis, J.; Biggs, J. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950512–207: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013528. Source: OSTI; NTIS; GPO Dep.

All major magnets of the Advanced Photon Source (APS) have now been measured and installed in the facility. This paper describes the mechanical design, construction, and procurement philosophy and methodology, and lessons learned from the construction and procurement of more than 1500 magnets for the APS storage ring, injector synchrotron ring, and positron accumulator ring.

21937 (ANL/ASD/CP–84937) **Design and test results of kicker units for the positron accumulator ring at the APS.** Wang, J. Argonne National Lab., IL (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–165: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95012291. Source: OSTI; NTIS; GPO Dep.

Three fast kicker units have been designed, tested, and installed in the positron accumulator ring (PAR) at the Advanced Photon Source (APS) for beam injection and extraction. The performance of these kicker units has been satisfactory. This presents the design and test results.

21938 (ANL/ASD/CP–85095) **Study of field ionization in the charge exchange injection for the IPNS upgrade.** Chase, Yong-Chul, Cho, Yanglai. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–222: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013762. Source: OSTI; NTIS; INIS; GPO Dep.

The proposed I-MW neutron spallation source is a rapid-cycling synchrotron (RCS) with a design intensity of 1.04×10^{14} protons. A H- beam from the linac is injected into the synchrotron via the charge exchange process. Due to the high intensity of the beam, the minimization of beam loss is one of the primary concerns. In this paper, we study a possible beam loss associated with field ionization, which includes estimates of the charge fraction and level distribution of the excited hydrogen atoms after stripping, and an estimate of lifetime of the excited hydrogen atoms in the transverse magnetic field.

21939 (ANL/ASD/CP–86682) **A VXI-based, integrated system of beam position monitoring and rf measuremednt for the Advanced Photon Source (APS) linear accelerator.** Grelick, A.E.; Arnold, N.; Clifft, B.; Fuja, R.; Ko, K.; White, M. Argonne National Lab., IL (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950534–2: Conference on real-time computer applications in nuclear, particle and plasma physics (RT), East Lansing, MI (United States), 22-26 May 1995). Order Number DE95013373. Source: OSTI; NTIS; GPO Dep.

A combined system of beam position monitoring and rf measurement has been implemented at the APS S-band linear accelerator (linac). The linac is subdivided into five sectors and each sector is comprised of a klystron and associated accelerating structures. The instrumentation for each sector is located, together with its processor, in two VM mainframes. This system has operated successfully for more than a year.

21940 (ANL-HEP-CP–95-34) **The Argonne Wakefield Accelerator high current photocathode, gun and drive linac.** Schoessow, P. (and others); Chojnacki, E.; Cox, G. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–175: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013374. Source: OSTI; NTIS; INIS; GPO Dep.

The Argonne Wakefield Accelerator (AWA) is a new facility for advanced accelerator research. A major component of the AWA is its drive linac, consisting of a unique high current short pulse L-Band photocathode based gun and special standing wave preaccelerator designed to produce 100 nC, 30 ps electron bunches at 20 MeV. Commissioning on the drive linac is now underway. We report on our initial operating experience with this novel machine, including bunch length and emittance measurements.

21941 (ANL/PHY/CP–86382) **Recent developments in ECRIS technology at Argonne National Laboratory and the New ATLAS 14 GHz ECRIS Project.** Harkewicz, R.; Billquist, P.J.; Pardo, R.C. Argonne National Lab., IL (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9504165–1: 12. international workshop on ECR ion sources, Riken (Japan), 25-27 Apr 1995). Order Number DE95011819. Source: OSTI; NTIS; INIS; GPO Dep.

A summary of recent developments in ECRIS technology taking place at Argonne National Laboratory is presented in this paper. A pulsed laser for ablation of solid material into the source plasma has been used online with the ATLAS PII-ECRIS and has allowed direct time measurements to be made which verify and quantify sequential, step-by-step ionization taking place in an ECRIS. In addition, during the course of these laser studies a method was discovered which, from an operational viewpoint, represents an important new method for incorporating solid materials into an ECRIS. We also report on a new 14 GHz ECRIS currently under construction at Argonne. This new ECRIS, along with a new 300 kV high voltage platform and building addition, will further the capabilities of the ATLAS facility by providing the accelerator with a second, independent ECRIS.

21942 (ANL/XFD/CP–84868) **The elliptical multipole wiggler project.** Gluskin, E. (and others); Frachon, D.; Ivanov, P.M. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38 ; AC02-76CH00016. (BNL–61858; CONF-950512–164: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95012261. Source: OSTI; NTIS; GPO Dep.

The elliptical multipole wiggler (EMW) has been designed, constructed, and installed in the X13 straight section of the NSLS X-ray Ring. The EMW generates circularly polarized photons in the energy range of 0.1-10 keV with AC modulation of polarization helicity. The vertical magnetic field of 0.8 T is produced by a hybrid permanent magnet structure with a period of 16 cm. The horizontal magnetic field of 0.22 T is generated by an electromagnet, the core of which is fabricated from laminated iron to operate with a switching frequency up to 100 Hz. There are dynamic compensation trim magnets at the wiggler ends to control the first and second field integrals with very high accuracy throughout the AC cycle. The residual closed orbit motion due to the electromagnet AC operation is discussed.

21943 (BNL–52435, pp. 3-22) **RF photoinjectors: A guide to performance requirements and demands on laser systems.** Rosenzweig, J.B. (Univ. of California, Los Angeles, CA (United States)). Brookhaven National Lab., Upton, NY (United States). [1994]. (CONF-9405276–: Lasers for RF guns, Anaheim, CA (United States), 14-15 May 1994). In *Lasers for RF guns: Proceedings.* 153p. Order Number DE95004856. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the demands on drive laser performance made by the performance expected of present and future rf photocathode injectors. The author reviews the relevant charged particle beam physics of rf photocathode guns as well as the technology and physics applications of these devices. The role of the drive laser is examined within this context. Several examples of demanding future rf photoinjector systems are discussed.

21944 (BNL–52435, pp. 23-40) **Lasers for RF guns: Capabilities of lasers, present and future.** Davis, J. Brookhaven National Lab., Upton, NY (United States). [1994]. (CONF-9405276–: Lasers for RF guns, Anaheim, CA (United States), 14-15 May 1994). In *Lasers for RF guns: Proceedings.* 153p. Order Number DE95004856. Source: OSTI; NTIS; INIS; GPO Dep.

A review of commercial laser systems used for cathode illumination in free electron lasers and other RF gun electron sources is presented with emphasis on systems based on solid state laser components. Performance examples and possible future improvements on the systems are discussed.

21945 (BNL–52435, pp. 41-42) **Gigahertz repetition rate AlGaAs/Ti:Sapphire (LISAF) modelocked oscillator/power amplifier laser system for advanced photoinjectors.** Fochs, S.N. (Univ. of California, Davis, CA (United States)); Le Sage, G.P.; McNally, J.D.; Hartemann, F.V.; Luhmann, N.C. Jr.; Heritage, J.P.; Perry, M.D.; Delfyett, P.J. Brookhaven National Lab., Upton, NY (United States). [1994]. (CONF-9405276–: Lasers for RF guns, Anaheim, CA (United States), 14-15 May 1994). In *Lasers for RF guns: Proceedings.* 153p. Order Number DE95004856. Source: OSTI; NTIS; INIS; GPO Dep.

A novel AlGaAs /Ti:Sapphire (LiSAF) modelocked oscillator / power amplifier laser system, capable of operating in burst mode (> 100 pulses) at 1.3 GHz, and producing frequency-tripled pulses with an energy > 10 μJ at 278 nm, duration < 500 fs, and jitter < 400 fs to irradiate Cesium Telluride photocathodes is described.

21946 (BNL–52435, pp. 43-54) **The synchro laser system for the CLIC Test Facility.** Schreiber, S. (European Laboratory for Particle Physics CERN, Geneva (Switzerland)). Brookhaven National Lab., Upton, NY (United States). [1994]. (CONF-9405276–: Lasers for RF guns, Anaheim, CA (United States), 14-15 May 1994). In *Lasers for RF guns: Proceedings.* 153p. Order Number DE95004856. Source: OSTI; NTIS; INIS; GPO Dep.

The CLIC Test Facility at CERN uses a laser driven 3 GHz electron gun. Considerable effort has been spent to develop a laser system, which meets the requirements of the Test Facility. The laser is based on a diode-pumped ND:YLF mode-locked oscillator. It delivers a 250 MHz train of laser pulses at 1047 nm with a length of 6.6 ps. A phase-locked timing stabilizer is used to synchronize the laser with the rf-gun. One or two pulses are amplified to 10 mJ. The amplifier system is based on a regenerative amplifier and two single pass power amplifiers. A set of harmonic generators deliver laser pulses at 523 nm, 262 nm and optional at 209nm. The measured pulse length after amplification and harmonic generations is 8 ± 2 ps (FWHM). A good pointing stability and a reasonable uniform transverse profile is obtained by relay imaging and spatial filtering. For some experiments, a train of electron bunches is used. A new pulse train generator working at 262 nm was developed to split the laser beam into 12 pulses. The simultaneous amplification of two seed laser pulses gives the possibility to double the number of pulses in the train without the need to add further splitting stages.

21947 (BNL–52435, pp. 55-63) **Drive lasers and photocathodes for the advanced free electron laser project.** Kinross-Wright, J. (Los Alamos National Lab., NM (United States)). Brookhaven National Lab., Upton, NY (United States). [1994]. (CONF-9405276–: Lasers for RF guns, Anaheim, CA (United States), 14-15 May 1994). In *Lasers for RF guns: Proceedings.* 153p. Order Number DE95004856. Source: OSTI; NTIS; INIS; GPO Dep.

This is a status report on the state-of-the-art in photoinjector technology at Los Alamos. Recent progress with cesium telluride photocathodes will be described. The design and performance of the existing drive laser for the Advanced Free Electron Laser project will be reviewed. Finally, efforts underway to produce an all diode-pumped photocathode drive laser will be discussed.

21948 (BNL–52435, pp. 65-72) **The SLAC polarized electron source laser system.** Frisch, J. (Stanford Linear Accelerator Center, CA (United States)). Brookhaven National Lab., Upton, NY (United States). [1994]. (CONF-9405276–: Lasers for RF guns, Anaheim, CA (United States), 14-15 May 1994). In *Lasers for RF guns: Proceedings.* 153p. Order Number DE95004856. Source: OSTI; NTIS; INIS; GPO Dep.

The Stanford Linear Collider (SLC) has operated a polarized photocathode electron source and titanium sapphire laser for high energy physics collisions for over 6500 hours of nearly continuous operation. The laser system for the source has demonstrated >98.5% total uptime for the duration of the experiment. The laser system uses a pair of titanium sapphire oscillators pumped by frequency doubled YAG lasers to produce 2ns, 250 μJ pulses at wavelengths from 740 nm to 870 nm.

21949 (BNL–52435, pp. 73-88) **The Brookhaven Accelerator Test Facility Nd:YAG laser.** Babzien, M. (Brookhaven National Lab., Upton, NY (United States)); Fisher, A.; Srinivasan-Rao, T. Brookhaven National Lab., Upton, NY (United States). [1994]. (CONF-9405276–: Lasers for RF guns, Anaheim, CA (United States), 14-15 May 1994). In *Lasers for RF guns: Proceedings.* 153p.
